Methyldopa: MAO Inhibitors may enhance the adverse/toxic effect of Methyldopa. *Risk X: Avoid combination*

Methylphenidate: MAO Inhibitors may enhance the hypertensive effect of Methylphenidate. *Risk X: Avoid combination*

Mirtazapine: MAO Inhibitors may enhance the neurotoxic (central) effect of Mirtazapine. *Risk X: Avoid combination*

Propoxyphene: May enhance the adverse/toxic effect of MAO Inhibitors. Specifically, the risk of serotonin syndrome or other serotonergic adverse events may be increased. *Risk X: Avoid combination*

Rauwolfia Alkaloids: MAO Inhibitors may enhance the adverse/toxic effect of Rauwolfia Alkaloids. Existing MAOI therapy can result in paradoxical effects of added rauwolfia alkaloids (eg, excitation, hypertension). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Serotonin 5-HT1D Receptor Agonists: MAO Inhibitors may decrease the metabolism of Serotonin 5-HT1D Receptor Agonists. Management: If MAO inhibitor therapy is required, naratriptan, eletriptan or frovatriptan may be a suitable 5-HT1D agonist to employ. **Exceptions:** Eletriptan; Frovatriptan; Naratriptan. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Serotonin/Norepinephrine Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tetrabenazine: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

TraMADol: May enhance the neuroexcitatory and/or seizure-potentiating effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: MAO Inhibitors may enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol. Avoid beverages containing tyramine (hearty red wine and beer).

Food: Concurrent ingestion of foods rich in tyramine may cause sudden and severe high blood pressure (hypertensive crisis). Avoid tyramine-containing foods with MAO-Is. Food's freshness is also an important concern; improperly stored or spoiled food can create an environment where tyramine concentrations may increase.

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava (may increase risk of serotonin syndrome and/or excessive sedation); Avoid supplements containing caffeine, tyrosine, tryptophan, or phenylalanine. Ingestion of large quantities may increase the risk of severe side effects (eg, hypertensive reactions, serotonin syndrome).

Monitoring ParametersBlood pressure; symptoms of parkinsonism; general mood and behavior (increased anxiety, or presence of mania or agitation); skin examination for presence of melanoma (higher incidence in Parkinson's patients- drug causation not established)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness according to rationale for therapy and adverse reactions at beginning of therapy and periodically throughout therapy. Monitor blood pressure. Be alert to thoughts of suicide. Patient should be cautioned against eating foods high in tyramine (see Tyramine Contents of Foods list). Increased risk for melanoma exists. Do skin exam periodically. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed (may be prescribed in conjunction with levodopa/carbidopa); do not change dosage or discontinue without consulting prescriber. Therapeutic effects may take several weeks or months to achieve and you may need frequent monitoring during first weeks of therapy. Take with meals if GI upset occurs, before meals if dry mouth occurs, or after eating if drooling or if nausea occurs. Take at the same time each day. Avoid tyramine-containing foods and for two weeks once the medication had been stopped. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Do not use alcohol and prescription or OTC sedatives or CNS depressants without consulting prescriber. You may experience drowsiness, dizziness, confusion, or vision changes (use caution when driving, climbing stairs, or engaging in tasks requiring alertness until response to drug is known); orthostatic hypotension (use caution when changing position - rising to standing from sitting or lying); constipation (increased exercise, fluids, fruit, or fiber may help); runny nose or flu-like symptoms (consult prescriber for appropriate relief); or nausea, vomiting, loss of appetite, or stomach discomfort (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). You are at an increased risk of melanoma. Have skin monitored by a qualified professional. Report any skin changes or suspicious areas. Report unresolved constipation or vomiting; chest pain, palpitations, irregular heartbeat; CNS changes (hallucination, loss of memory, seizures, acute headache, nervousness, thoughts of suicide, etc); painful or difficult urination; increased muscle spasticity, rigidity, or involuntary movements; skin rash; or significant worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Azilect®: 0.5 mg, 1 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Azilect)

0.5 mg (30): $297.81

1 mg (30): $284.66

Mechanism of ActionPotent, irreversible and selective inhibitor of brain monoamine oxidase (MAO) type B, which plays a major role in the catabolism of dopamine. Inhibition of dopamine depletion in the striatal region of the brain reduces the symptomatic motor deficits of Parkinson's disease. There is also experimental evidence of rasagiline conferring neuroprotective effects (antioxidant, antiapoptotic), which may delay onset of symptoms and progression of neuronal deterioration.

Pharmacodynamics/Kinetics

Onset of action: Therapeutic: Within 1 hour

Duration: ~1 week (irreversible inhibition); may require ~14-40 days for complete restoration of (brain) MAO-B activity

Absorption: Rapid

Protein binding: 88% to 94%

Metabolism: Hepatic N-dealkylation and/or hydroxylation via CYP1A2 to multiple inactive metabolites (nonamphetamine derivatives)

Distribution: V_{dss}: 87 L

Bioavailability: 36%

Half-life elimination: ~1.3-3 hours (no correlation with biologic effect due to irreversible inhibition)

Time to peak, plasma: 30 minutes to 1 hour

Excretion: Urine (62%, >99% as metabolites); feces (7%)

Related Information

- Antiparkinsonian Agents
- Tyramine Content of Foods

Pharmacotherapy PearlsWhen adding rasagiline to levodopa/carbidopa, the dose of the latter can usually be decreased. Studies are investigating the use of rasagiline in early Parkinson's disease to slow the progression of the disease.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation). Anticholinergic side effects can cause a reduction of saliva production or secretion, contributing to discomfort and dental disease (ie, caries, oral candidiasis, and periodontal disease). May cause orthostatic hypotension particularly during the first 2 months of therapy.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsRasagiline in approved doses of 0.5-1 mg daily should not inhibit type-A MAO; however, the possibility exists of nonselective MAO inhibition at higher doses and/or in certain sensitive individuals. Therefore, attempts should be made to avoid use of vasoconstrictors due to possibility of hypertensive episodes.

Mental Health Comment

Adverse effects: Rasagiline is a second generation MAO type B selective inhibitor derived from the propargylamine class of compounds from which selegiline originates. However, unlike selegiline, the parent structure of rasagiline is not an amphetamine derivative, nor is it metabolized to an amphetamine-like structure. This structural difference may differentiate rasagiline from selegiline in terms of an overall lower incidence of psychiatric and vasoactive side effects (eg, hallucinations, orthostasis).

Selective MAO inhibition: Comparable to selegiline, rasagiline has been shown in both *in vitro* and *in vivo* animal model investigations to inhibit MAO-B (by 50%) approximately 17- to 65-fold more selectively than MAO-A. However, >80% inhibition of MAO-B is regarded as necessary for therapeutic benefit. As selectivity is lost in a dose-dependent manner, higher dosages needed to achieve this target may compromise selectivity. *In vivo* animal data show that ≥80% inhibition of MAO-B was achieved by rasagiline doses in rats which were 10-fold higher than the therapeutic human dose (on a mg/kg basis). At this dose level, rasagiline retained nearly fourfold selectivity for MAO-B. The extent of selectivity for MAO-B given higher doses and/or extended durations of exposure in humans is not known. Given the lack of clinical data fully characterizing the effects of rasagiline on gut MAO-A activity at therapeutically effective doses, there remains a warning on the dietary consumption of tyramine-containing foods.

Anesthesia and Critical Care Concerns/Other ConsiderationsWhen adding rasagiline to levodopa/carbidopa, the dose of the latter can usually be decreased. Studies are investigating the use of rasagiline in early Parkinson's disease to slow the progression of the disease.

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(ras BYOOR i kayse)

U.S. Brand NamesElitek™

Canadian Brand NamesFasturtec®

Pharmacologic CategoryEnzyme; Enzyme, Urate-Oxidase (Recombinant)

Use: Labeled IndicationsInitial management of uric acid levels in pediatric patients with leukemia, lymphoma, and solid tumor malignancies receiving anticancer therapy expected to result in tumor lysis and elevation of plasma uric acid

Use: Unlabeled/InvestigationalPrevention and treatment of malignancy-associated hyperuricemia in adults

Dosing: Adults**Management of malignancy-associated hyperuricemia** (unlabeled use): 0.2 mg/kg/day for 3-7 days, beginning the day before or day of chemotherapy **or** 0.15-0.2 mg/kg as a single dose, repeated if needed based on uric acid levels **or** 3-6 mg as a single dose, repeated (1.5-6 mg) if needed based on uric acid levels

Dosing: ElderlyRefer to adult dosing. Insufficient data collected in geriatric patients to determine response to treatment.

Dosing: Pediatric

Management of uric acid levels: I.V.: Children: 0.15 mg/kg or 0.2 mg/kg once daily for 5 days (manufacturer-recommended duration); begin chemotherapy 4-24 hours after the first dose

Note: Limited data suggest that a single prechemotherapy dose (versus multiple-day administration) may be sufficiently efficacious. Monitoring electrolytes, hydration status, and uric acid concentrations are necessary to identify the need for additional doses. Other clinical manifestations of tumor lysis syndrome (eg, hyperphosphatemia, hypocalcemia, and hyperkalemia) may occur.

Administration: I.V.I.V. infusion over 30 minutes; do **not** administer as a bolus infusion. Do **not** filter during infusion. If not possible to administer through a separate line, I.V. line should be flushed with at least 15 mL saline prior to and following rasburicase infusion.

StoragePrior to reconstitution, store with diluent at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light. Reconstituted and final solution may be stored up to 24 hours at 2°C to 8°C (36°F to 46°F). Discard unused product.

ReconstitutionReconstitute each vial with 1 mL of the provided diluent. Mix by gently swirling; do **not** shake or vortex. Discard if discolored or containing particulate matter. Total dose should be further diluted in NS to a final volume of 50 mL.

ContraindicationsHypersensitivity, hemolytic or methemoglobinemia reactions to rasburicase or any component of the formulation; glucose-6-phosphatase dehydrogenase (G6PD) deficiency

Warnings/Precautions

Boxed warnings:

- Anaphylaxis/hypersensitivity reactions: See “Concerns related to adverse effects” below.
- Hemolysis: See “Concerns related to adverse effects” below.
- Methemoglobinemia: See “Concerns related to adverse effects” below.
- Uric acid degradation: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: **[U.S. Boxed Warning]: Hypersensitivity reactions (including anaphylaxis) have been reported;** reactions may occur at any time during treatment (including the initial dose); discontinue **immediately and permanently** in patients developing any of these reactions.
- Hemolysis: **[U.S. Boxed Warning]: Hemolysis may be associated with G6PD deficiency; patients at higher risk for G6PD deficiency should be screened prior to therapy.** Use is contraindicated in patients with G6PD deficiency.
- Methemoglobinemia: **[U.S. Boxed Warning]: Discontinue immediately and permanently in any patient developing methemoglobinemia.**

Other warnings/precautions:

- Multiple courses: Rasburicase is immunogenic and can elicit an antibody response; administration of more than one course is not recommended.
- Uric acid degradation: **[U.S. Boxed Warning]: Enzymatic degradation of uric acid in blood samples will occur if left at room temperature;** specific guidelines for the collection of plasma uric acid samples must be followed.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsAs reported in patients receiving rasburicase with antitumor therapy versus active-control:

>10%:

- Central nervous system: Fever (5% to 46%), headache (26%)
- Dermatologic: Rash (13%)
- Gastrointestinal: Vomiting (50%), nausea (27%), abdominal pain (20%), constipation (20%), diarrhea (≤1% to 20%), mucositis (2% to 15%)

1% to 10%:

- Hematologic: Neutropenia with fever (4%), neutropenia (2%)
- Respiratory: Respiratory distress (3%)
- Miscellaneous: Sepsis (3%)

<1%: Acute renal failure, anaphylaxis, arrhythmia, cardiac arrest, cardiac failure, cellulitis, cerebrovascular disorder, chest pain, convulsions, cyanosis, dehydration, hemolysis, hemorrhage, hot flashes, ileus, infection, intestinal obstruction, methemoglobinemia, MI, pancytopenia, paresthesia, pneumonia, pulmonary edema, pulmonary hypertension, retinal hemorrhage, rigors, thrombosis, thrombophlebitis

Drug InteractionsThere are no known significant interactions.

Test InteractionsSpecific handling procedures must be followed to prevent the degradation of uric acid in plasma samples. Blood must be collected in prechilled tubes containing heparin anticoagulant. Samples must then be **immediately** immersed in an ice water bath. Prepare samples by centrifugation in a precooled centrifuge (4°C). Samples must be kept in ice water bath and analyzed within 4 hours of collection.

Monitoring ParametersPlasma uric acid levels, CBC

Nursing: Physical Assessment/MonitoringSee I.V. Administration for specifics. Patient must be observed closely for hypersensitivity reaction (which can occur within minutes of administration). Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions prior to initiating therapy and on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Patient EducationThis medication can only be administered by infusion; you will be monitored closely during and following infusion. Report immediately any pain, burning, swelling at infusion site, or any signs of allergic reaction (eg, respiratory difficulty or swallowing, back pain, chest tightness, rash, hives, swelling of lips or mouth). Report headache, nausea, or respiratory difficulty.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

- Elitek™: 1.5 mg [packaged with three 1 mL ampuls of diluent]; 7.5 mg [packaged with 5 mL of diluent]

Generic AvailableNo

ManufacturerSanofi-Synthelabo, Inc

Mechanism of ActionRasburicase is a recombinant urate-oxidase enzyme, which converts uric acid to allantoin (an inactive and soluble metabolite of uric acid); it does not inhibit the formation of uric acid.

Pharmacodynamics/Kinetics

Distribution: Pediatric patients: 110-127 mL/kg

Half-life elimination: Pediatric patients: 18 hours

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mucositis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; use caution with SSRIs. May cause neutropenia; use caution with clozapine.

Regadenoson

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(re ga DEN of son)

U.S. Brand NamesLexiscan™

Pharmacologic CategoryDiagnostic Agent

Use: Labeled IndicationsRadionuclide myocardial perfusion imaging (MPI) in patients unable to undergo adequate exercise stress testing

Dosing: Adults**Myocardial perfusion imaging:** I.V.: 0.4 mg (5 mL) over ~10 seconds, followed immediately by a 5 mL saline flush. Wait 10-20 seconds, then administer the radionuclide myocardial perfusion imaging agent.

Dosing: ElderlyRefer to adult dosing.

Administration: I.V.Administer over approximately 10 seconds into a peripheral vein using a 22-gauge or larger catheter or needle, followed immediately by a 5 mL saline flush. Wait 10-20 seconds, then administer the radionuclide myocardial perfusion imaging agent. The radionuclide may be injected directly into the same catheter as regadenoson.

Dietary ConsiderationsAvoid dietary caffeine for at least 12 hours prior to pharmacologic stress testing.

StorageStore at controlled room temperature of 25°C (77°F).

Warnings/Precautions

Concerns related to adverse events:

- Myocardial ischemia: Pharmacological stress agents may produce myocardial ischemia resulting in life threatening ventricular arrhythmias, MI, and cardiac arrest. Equipment for resuscitation and trained personnel experienced in handling cardiac emergencies should always be immediately available prior to administration. If serious reactions occur, consider the use of aminophylline, an adenosine antagonist.

- Conduction disturbances: Regadenoson depresses SA and AV node conduction and may produce first-, second-, third-degree heart block, or sinus bradycardia. Use caution in patients with first-degree AV block or bundle branch block. Functional pacemaker must be in place to use in patients with second- or third-degree AV block or sinus node dysfunction.

- Hypotension: May produce profound vasodilation with subsequent hypotension especially in the elderly. Use with caution in patients with autonomic dysfunction, carotid stenosis (with cerebrovascular insufficiency), uncorrected hypovolemia, left main coronary artery stenosis, pericarditis, pericardial effusion and/or stenotic valvular heart disease.

Disease-related concerns:

- Respiratory disease: Regadenoson may cause bronchoconstriction in patients with asthma; should be used cautiously in patients with obstructive lung disease not associated with bronchoconstriction (eg, COPD/emphysema, bronchitis). Equipment for resuscitation and appropriate bronchodilator (eg, albuterol) therapy should always be immediately available prior to administration.

Concurrent drug therapy issues:

- Dipyridamole: When possible, dipyridamole should be withheld for at least 2 days prior to regadenoson administration; concurrent use of dipyridamole increases the risk of adverse effects of regadenoson.

- Theophylline derivatives: Patients should avoid consumption of any products containing theophylline derivatives (eg, aminophylline, caffeine) for at least 12 hours prior to regadenoson administration. Aminophylline may be used to reverse any severe or persistent adverse reactions to regadenoson.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <18 years of age.

Geriatric ConsiderationsIn initial studies, elderly had a higher incidence of hypotension (2% vs <1%).

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have demonstrated embryo-fetal toxicity and maternal toxicity. There are no adequate and well-controlled studies in pregnant women. Use only if potential benefit outweighs risk to fetus.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse effects in the nursing infant, the manufacturer recommends interrupting nursing for 10 hours after administration.

Adverse Reactions

>10%:

Cardiovascular: Tachycardia (22%), flushing (16%), premature ventricular contractions (14%), chest discomfort (13%), angina or ST segment depression (12%)

Central nervous system: Headache (26%)

Respiratory: Dyspnea (28%)

1% to 10%:

Cardiovascular: Chest pain (7%), premature atrial contractions (7%), systolic blood pressure decreased >35 mm Hg (7%), ventricular conduction abnormalities (6%) diastolic blood pressure decreased >25 mm Hg (4%), first-degree AV block (PR prolongation >220 msec; 3%)

Central nervous system: Dizziness (8%)

Gastrointestinal: Nausea (6%), abdominal discomfort (5%), dysgeusia (5%)

Miscellaneous: Feeling hot (5%)

<1%: Second-degree AV block, AV conduction abnormalities (other than AV blocks)

Drug Interactions

Aminophylline: May diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Caffeine: May diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Dipyridamole: May enhance the therapeutic effect of Regadenoson. *Risk D: Consider therapy modification*

Theophylline: May diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Avoid food or drugs with caffeine. Regadenoson's diagnostic effect may be decreased if used concurrently with caffeine. Avoid dietary caffeine for at least 12 hours prior to pharmacologic stress testing.

Monitoring ParametersHeart rate, blood pressure, continuous cardiac monitoring, oxygen saturation

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions or toxicity (eg, hold theophylline derivatives [12 hours] and dipyridamole [2 days]). See Administration for I.V. specifics. Patient must be monitored closely. Cardiopulmonary resuscitation equipment and experienced staff should be available during administration. Teach patient purpose for use and procedure, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis drug can only be administered by intravenous infusion. You will be monitored closely during and following infusion. Report immediately any dizziness, nausea, headache, difficulty breathing, or chest pain or tightness. Following infusion, you may experience a headache (consult prescriber for appropriate analgesic), abdominal discomfort (consult prescriber if this persists), or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Lexiscan™ 0.08 mg/mL (5 mL) [contains edetate disodium and propylene glycol 150 mg/mL]

Generic AvailableNo

ManufacturerBaxter Pharmaceutical Solutions LLC

Mechanism of ActionRegadenoson, a low affinity agonist of the A2A adenosine receptor, increases coronary blood flow (CBF) and mimics the increase in CBF caused by exercise. Myocardial uptake of the radiopharmaceutical is proportional to CBF creating the contrast required to identify stenotic coronary arteries.

Pharmacodynamics/Kinetics

Distribution: 11.5 L

Metabolism: Unknown

Half-life elimination: Intermediate phase: 30 minutes; Terminal phase: 2 hours

Time to peak: 1-4 minutes

Excretion: Urine (57% as unchanged drug)

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Remifentanil may be confused with alfentanil

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(rem i FEN ta nil)
U.S. Brand NamesUltiva®
Canadian Brand NamesUltiva®
Pharmacologic CategoryAnalgesic, Opioid; Anilidopiperidine Opioid
Use: Labeled IndicationsAnalgesic for use during the induction and maintenance of general anesthesia; for continued analgesia into the immediate postoperative period; analgesic component of monitored anesthesia
Use: Unlabeled/InvestigationalManagement of pain in mechanically-ventilated patients
Dosing: AdultsAnesthesia: I.V. continuous infusion: **Note:**Dose should be based on ideal body weight (IBW) in obese patients (>30% over IBW).

Induction of anesthesia: 0.5-1 mcg/kg/minute; if endotracheal intubation is to occur in <8 minutes, an initial dose of 1 mcg/kg may be given over 30-60 seconds

Coronary bypass surgery: 1 mcg/kg/minute

Maintenance of anesthesia: Supplemental bolus dose of 1 mcg/kg may be administered every 2-5 minutes. Consider increasing concomitant anesthetics with infusion rate >1 mcg/kg/minute. Infusion rate can be titrated upward in increments of 25% to 100% or downward in decrements of 25% to 50%. May titrate every 2-5 minutes.

With nitrous oxide (66%): 0.4 mcg/kg/minute (range: 0.1-2 mcg/kg/minute)

With isoflurane: 0.25 mcg/kg/minute (range: 0.05-2 mcg/kg/minute)

With propofol: 0.25 mcg/kg/minute (range: 0.05-2 mcg/kg/minute)

Coronary bypass surgery: 1 mcg/kg/minute (range: 0.125-4 mcg/kg/minute); supplemental dose: 0.5-1 mcg/kg

Continuation as an analgesic in immediate postoperative period: 0.1 mcg/kg/minute (range: 0.025-0.2 mcg/kg/minute). Infusion rate may be adjusted every 5 minutes in increments of 0.025 mcg/kg/minute. Bolus doses are not recommended. Infusion rates >0.2 mcg/kg/minute are associated with respiratory depression.

Coronary bypass surgery, continuation as an analgesic into the ICU: 1 mcg/kg/minute (range: 0.05-1 mcg/kg/minute)

Analgesic component of monitored anesthesia care:

Note: Supplemental oxygen is recommended:

Single I.V. dose given 90 seconds prior to local anesthetic:

Remifentanil alone: 1 mcg/kg over 30-60 seconds

With midazolam: 0.5 mcg/kg over 30-60 seconds

Continuous infusion beginning 5 minutes prior to local anesthetic:

Remifentanil alone: 0.1 mcg/kg minute

With midazolam: 0.05 mcg/kg/minute

Continuous infusion given after local anesthetic:

Remifentanil alone: 0.05 mcg/kg/minute (range: 0.025-0.2 mcg/kg/minute)

With midazolam: 0.025 mcg/kg/minute (range: 0.025-0.2 mcg/kg/minute)

Note: Following local or anesthetic block, infusion rate should be decreased to 0.05 mcg/kg/minute; rate adjustments of 0.025 mcg/kg/minute may be done at 5-minute intervals

Critically-ill patients (unlabeled dose): Continuous infusion: 42-1050 mcg/hour (based on 70 kg patient) **or** 0.6-15 mcg/kg/hour

Dosing: ElderlyElderly patients have an increased sensitivity to effect of remifentanil. Doses should be decreased by $^1/_2$ and titrated.

Dosing: Pediatric**Note:** Dose should be based on ideal body weight (IBW) in obese patients (>30% over IBW).

Maintenance of anesthesia with nitrous oxide (70%): Children Birth to 2 months: Continuous I.V. infusion: 0.4 mcg/kg/minute (range: 0.4-1 mcg/kg/minute); supplemental bolus dose of 1 mcg/kg may be administered, smaller bolus dose may be required with potent inhalation agents, potent neuraxial anesthesia, significant comorbidities, significant fluid shifts, or without atropine pretreatment. Clearance in neonates is highly variable; dose should be carefully titrated.

Maintenance of anesthesia with halothane, sevoflurane, or isoflurane: Continuous I.V. infusion: Children 1-12 years: 0.25 mcg/kg/minute (range: 0.05-1.3 mcg/kg/minute); supplemental bolus dose of 1 mcg/kg may be administered every 2-5 minutes. Consider increasing concomitant anesthetics with infusion rate >1 mcg/kg/minute. Infusion rate can be titrated upward in increments up to 50% or titrated downward in decrements of 25% to 50%. May titrate every 2-5 minutes.

Calculations

- Ideal Body Weight: Adults
- Ideal Body Weight: Pediatrics

Administration: I.V.An infusion device should be used to administer continuous infusions. During the maintenance of general anesthesia, I.V. boluses may be administered over 30-60 seconds. Injections should be given into I.V. tubing close to the venous cannula; tubing should be cleared after treatment to prevent residual effects when other fluids are administered through the same I.V. line.

StoragePrior to reconstitution, store at 2°C to 25°C (36°F to 77°F). Stable for 24 hours at room temperature after reconstitution and further dilution to concentrations of 20-250 mcg/mL (4 hours if diluted with LR).

ReconstitutionPrepare solution by adding 1 mL of diluent per 1 mg of remifentanil. Shake well. Further dilute to a final concentration of 20, 25, 50, or 250 mcg/mL.

CompatibilityStable in D$_5$LR, D$_5$NS, D$_5$W, $^1/_2$NS, NS, sterile water for injection; **variable stability (consult detailed reference)** in LR.

Incompatible with blood products.

Y-site administration: Compatible: Acyclovir, alfentanil, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bretylium, bumetanide, buprenorphine, butorphanol, calcium gluconate, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, clindamycin, dexamethasone sodium phosphate, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, droperidol, enalaprilat, epinephrine, esmolol, famotidine, fentanyl, fluconazole, furosemide, ganciclovir gatifloxacin, gentamicin, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, imipenem/cilastatin, inamrinone, isoproterenol, ketorolac, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, methylprednisolone sodium succinate, metoclopramide, metronidazole, midazolam, minocycline, morphine, nalbuphine, netilmicin, nitroglycerin, norepinephrine, ofloxacin, ondansetron, phenylephrine, piperacillin, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine edisylate, promethazine, ranitidine, sodium bicarbonate, sufentanil, theophylline, thiopental, ticarcillin, ticarcillin/clavulanate potassium, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, zidovudine. **Incompatible:** Amphotericin B cholesteryl sulfate complex. **Variable (consult detailed reference):** Amphotericin B, cefoperazone, chlorpromazine, diazepam.

Compatibility when admixed: Compatible: Propofol.

RestrictionsC-II

ContraindicationsNot for intrathecal or epidural administration, due to the presence of glycine in the formulation; hypersensitivity to remifentanil, fentanyl, or fentanyl analogs, or any component of the formulation

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).
- Intraoperative awareness: In patients <55 years of age, intraoperative awareness has been reported when used with propofol rates of ≤75 mcg/kg/minute.
- Opioid agonist toxicities: Shares the toxic potentials of opiate agonists, and precautions of opiate agonist therapy should be observed.

Disease-related concerns:

- Bradycardia: Use with caution when administering to patients with bradycardia.
- Obesity: Use with caution in patients who are morbidly obese.

Special populations:

- Pediatrics: Safety and efficacy for postoperative analgesic or monitored anesthesia care have not been established in children.

Other warnings/precautions:

- Discontinuation of therapy: Interruption of an infusion will result in offset of effects within 5-10 minutes; the discontinuation of infusion should be preceded by the establishment of adequate postoperative analgesia orders, especially for patients in whom postoperative pain is anticipated.
- General anesthesia use: Not recommended as the sole agent in general anesthesia, because the loss of consciousness cannot be assured.

- Rapid infusion: Inject slowly over 3-5 minutes; rapid I.V. infusion may result in skeletal muscle and chest wall rigidity, impaired ventilation, or respiratory distress/arrest; nondepolarizing skeletal muscle relaxant may be required.

- Trained individuals: Due to the high incidence of apnea, hypotension, tachycardia and muscle rigidity; it should be administered by individuals specifically trained in the use of anesthetic agents and should not be used in diagnostic or therapeutic procedures outside the monitored anesthesia setting; resuscitative and intubation equipment should be readily available.

Geriatric ConsiderationsElderly patients have an increased sensitivity to effect of remifentanil, therefore, doses should be decreased by $^{1}/_{2}$ and titrated.
Pregnancy Risk FactorC
Pregnancy ConsiderationsRemifentanil has been shown to cross the placenta. Neonatal respiratory depression and sedation may occur.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%: Gastrointestinal: Nausea, vomiting

1% to 10%:

Cardiovascular: Bradycardia (dose dependent), hypertension, hypotension (dose dependent), tachycardia

Central nervous system: Agitation, dizziness, fever, headache

Dermatologic: Pruritus

Neuromuscular & skeletal: Muscle rigidity (dose dependent)

Ocular: Visual disturbances

Respiratory: Apnea, hypoxia, respiratory depression

Miscellaneous: Postoperative pain, shivering

<1% (Limited to important or life-threatening): Anemia, anxiety, arrhythmia, bronchospasm, confusion, constipation, CPK-MB increased, diarrhea, dysphagia, electrolyte disorders, hallucination, heart block, pleural effusion, prolonged emergence from anesthesia, pulmonary edema, syncope, thrombocytopenia, xerostomia

Postmarketing and/or case reports: Anaphylactic/anaphylactoid reactions, asystole

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Beta-Blockers: Anilidopiperidine Opioids may enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): Anilidopiperidine Opioids may enhance the bradycardic effect of Calcium Channel Blockers (Nondihydropyridine). Anilidopiperidine Opioids may enhance the hypotensive effect of Calcium Channel Blockers (Nondihydropyridine). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

MAO Inhibitors: Anilidopiperidine Opioids may enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. Management: Avoid use of fentanyl (and other anilidopiperidine opioids when possible) in patients who have used a monoamine oxidase inhibitor within the past 14 days due to reports of unpredictable but severe adverse effects. *Risk D: Consider therapy modification*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Monitoring ParametersRespiratory and cardiovascular status, blood pressure, heart rate
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 1 mg, 2 mg, 5 mg [contains glycine 15 mg]

Generic AvailableNo
ManufacturerGlaxoSmithKline

Mechanism of ActionBinds with stereospecific mu-opioid receptors at many sites within the CNS, increases pain threshold, alters pain reception, inhibits ascending pain pathways

Pharmacodynamics/Kinetics

Onset of action: I.V.: 1-3 minutes

Distribution: V_d: 100 mL/kg; increased in children

Protein binding: ~70% (primarily alpha$_1$ acid glycoprotein)

Metabolism: Rapid via blood and tissue esterases

Half-life elimination (dose dependent): Terminal: 10-20 minutes; effective: 3-10 minutes

Excretion: Urine

Related Information

- Narcotic / Opioid Analgesics

Pharmacotherapy PearlsUltra short-acting narcotic that is unique compared to other short-acting narcotics. This agent is not considered suitable as the sole agent for induction; remifentanil should be used in combination with other induction agents. Bolus doses are not recommended for sedation cases and in treatment of postoperative pain due to risk of respiratory depression and muscle rigidity. Due to remifentanil's short duration of action, when postoperative pain is anticipated, discontinuation of an infusion of remifentanil should be preceded by an adequate postoperative analgesic (ie, fentanyl, morphine).

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or agitation

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other ConsiderationsUltra short-acting narcotic that is unique compared to other short-acting narcotics. This agent is not considered suitable as the sole agent for induction; remifentanil should be used in combination with other induction agents; bolus doses are not recommended for sedation cases and in treatment of postoperative pain due to risk of respiratory depression and muscle rigidity; due to remifentanil's short duration of action, when postoperative pain is anticipated, discontinuation of an infusion of remifentanil should be preceded by an adequate postoperative analgesic (ie, fentanyl, morphine).

Elderly patients have an increased sensitivity to effect of remifentanil, doses should be decreased by $^1/_2$ and titrated.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

PrandiMet™ may be confused with Avandamet®, Prandin®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(re PAG li nide & met FOR min)

U.S. Brand NamesPrandiMet™

Pharmacologic CategoryAntidiabetic Agent, Biguanide; Antidiabetic Agent, Meglitinide Derivative; Hypoglycemic Agent, Oral

Use: Labeled IndicationsManagement of type 2 diabetes mellitus (noninsulin dependent, NIDDM), as an adjunct to diet and exercise, in patients currently receiving or not adequately controlled on metformin and/or a meglitinide

Dosing: Adults**Type 2 diabetes mellitus:** Oral:

Patients currently taking repaglinide and metformin: Initial doses should be based on (but not exceeding) the patient's current doses of repaglinide and metformin; daily doses should be divided and given 2-3 times daily with meals (maximum single dose: 4 mg/dose [repaglinide], 1000 mg/dose [metformin]; maximum daily dose: 10 mg/day [repaglinide], 2500 mg/day [metformin])

Patients inadequately controlled on metformin alone: Initial dose: repaglinide 1 mg/ metformin 500 mg twice daily with meals. Titrate slowly to reduce the risk of repaglinide-induced hypoglycemia.

Patients inadequately controlled on a meglitinide alone: Initial dose: metformin 500 mg twice daily plus repaglinide at a dose similar to (but not exceeding) the patient's current dose. Titrate slowly to reduce the risk of metformin-induced gastrointestinal adverse effects.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentDo not use in renal impairment; metformin use is contraindicated in patients with renal impairment (serum creatinine ≥1.5 mg/dL in males or ≥1.4 mg/dL in females).

Dosing: Hepatic ImpairmentAvoid use in patients with impaired liver function.

Calculations

- Creatinine Clearance: Adults

Administration: OralAdminister 15-30 minutes before meals to avoid risk of hypoglycemia/GI upset; if a meal skipped or patient is NPO, do not administer dose.

Dietary ConsiderationsShould be taken 15-30 minutes before meals to prevent hypoglycemia and decrease the risk of GI upset; if the patient misses a meal or is NPO, the fixed-dose repaglinide/metformin combination agent should not be administered. Dietary modifications based on ADA recommendations are a part of therapy. Treatment may cause hypoglycemia; the patient should be able to recognize the signs and symptoms of hypoglycemia (palpitations, tachycardia, sweaty palms, diaphoresis, lightheadedness, etc). Monitor for signs and symptoms of vitamin B_{12} and/or folic acid deficiency; supplementation may be required.

StorageDo not store above 25°C (77°F). Protect from moisture.

ContraindicationsHypersensitivity to repaglinide, metformin, or any component of the formulation; renal impairment (serum creatinine ≥1.5 mg/dL in males or ≥1.4 mg/dL in females); acute or chronic metabolic acidosis (including diabetic ketoacidosis); concomitant administration of gemfibrozil and/or itraconazole

Warnings/Precautions

Boxed warnings:

- Lactic acidosis: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Cardiovascular mortality: Some studies suggest that sulfonylureas may be associated with increased cardiovascular events. Theoretically, repaglinide may also increase cardiovascular events, but there are no long-term studies assessing this concern; metformin does not appear to share this risk.

- Hypoglycemia: May cause hypoglycemia; appropriate patient selection, dosage, and patient education are important to avoid hypoglycemic episodes.

- Lactic acidosis: **[U.S. Boxed Warning]: Lactic acidosis is a rare, but potentially severe consequence of therapy with metformin.** Lactic acidosis should be suspected in any patient with diabetes receiving metformin with evidence of acidosis but without evidence of ketoacidosis. Discontinue metformin in clinical situations predisposing to hypoxemia, including conditions such as cardiovascular collapse, respiratory failure, acute myocardial infarction, acute congestive heart failure, and septicemia. The risk of accumulation and lactic acidosis increases with the degree of impairment of renal function.

Disease-related concerns:

- Adrenal/pituitary impairment: Use with caution in patients with adrenal and/or pituitary impairment; may be more susceptible to glucose-lowering effects.

- Diabetes mellitus (type 1): Not indicated for use in patients with insulin-dependent diabetes mellitus (IDDM; type 1).

- Heart failure: Use caution in patients with congestive heart failure requiring pharmacologic management, particularly in patients with unstable or acute heart failure; risk of lactic acidosis may be increased secondary to hypoperfusion.

- Hepatic impairment: Avoid use in patients with impaired liver function due to potential for lactic acidosis.

- Renal impairment: The combination product is not recommended for use in patients with renal impairment. Metformin is substantially excreted by the kidney; patients with renal function below the limit of normal for their age should not receive therapy. Use of concomitant medications that may affect renal function (ie, affect tubular secretion) may also affect metformin disposition. Metformin should be withheld in patients with dehydration and/or prerenal azotemia.

- Stress-related states: It may be necessary to discontinue therapy and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Concurrent drug therapy issues:

- Gemfibrozil: Concomitant use has been reported to result in prolonged, severe hypoglycemia; the addition of itraconazole may augment the effect of gemfibrozil on repaglinide. Concurrent use of gemfibrozil and/or itraconazole is contraindicated with the repaglinide/metformin fixed-dose combination product.

- NPH insulin: Repaglinide is not indicated for use in combination with NPH insulin; in two studies, reports of myocardial ischemia (6 events) in patients using repaglinide plus insulin have caused concern. Further evaluation is required to assess the safety of this combination.

Special populations:

- Elderly: Use with caution in the elderly; may be more susceptible to glucose-lowering effects. Metformin should not be initiated in patients ≥80 years of age unless normal renal function is confirmed.

- Malnourished patients: Use with caution in malnourished patients; may be more susceptible to glucose-lowering effects.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Ethanol use: Instruct patients to avoid excessive acute or chronic ethanol use; ethanol may potentiate metformin's effect on lactate metabolism.

- Iodinated contrast: Metformin therapy should be temporarily discontinued prior to or at the time of intravascular administration of iodinated contrast media (potential for acute alteration in renal function). Metformin should be withheld for 48 hours after the radiologic study and restarted only after renal function has been confirmed as normal.

- Surgical procedures: Therapy should be suspended for any surgical procedures (resume only after normal intake resumed and normal renal function is verified).

Geriatric ConsiderationsIntensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination; therefore, repaglinide/metformin is classified as pregnancy category C. See individual agents.

Lactation

Metformin: Enters breast milk/not recommended

Repaglinide: Excretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsSee individual agents.

Pregnancy & Lactation, In-Depth

- MetFORMIN in Pregnancy & Lactation
- Repaglinide in Pregnancy & Lactation

Adverse Reactions**Note:** The following information reflects the frequency of adverse effects experienced by patients who received the repaglinide/metformin fixed-dose combination product. Also see individual agents.

>10%:

Central nervous system: Headache (22%)

Endocrine & metabolic: Hypoglycemia (33%)

Gastrointestinal: Diarrhea (19%), nausea (15%)

Respiratory: Upper respiratory tract infection (11%)

Metabolism/Transport Effects Repaglinide: **Substrate** of CYP2C8 (major), 3A4 (major)

Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Repaglinide. Management: Concurrent use of an azole antifungal with both repaglinide and gemfibrozil should be avoided. *Risk C: Monitor therapy*

Cephalexin: May increase the serum concentration of MetFORMIN. *Risk C: Monitor therapy*

Cimetidine: May decrease the excretion of MetFORMIN. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

CycloSPORINE: May increase the serum concentration of Repaglinide. *Risk C: Monitor therapy*

CYP2C8 Inducers (Highly Effective): May increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Moderate): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Strong): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Gemfibrozil: May increase the serum concentration of Repaglinide. The addition of itraconazole may augment the effect of gemfibrozil on repaglinide. Management: Consider alternative therapy combinations to avoid this potentially significant interaction. Avoid concurrent use when also used with a CYP3A4 inhibitor. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Iodinated Contrast Agents: May enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Macrolide Antibiotics: May increase the serum concentration of Repaglinide. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Repaglinide. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Trimethoprim: May decrease the metabolism of Repaglinide. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid or limit ethanol (incidence of lactic acidosis may be increased; may cause hypoglycemia).

Food: Food may delay and decrease the extent of absorption of metformin; the AUC of repaglinide may also be decreased. Metformin may decrease the absorption of vitamin B_{12} and/or folic acid.

Herb/Nutraceutical: St John's wort may increase the metabolism of repaglinide. The following herbs exhibit hypoglycemic activity; concomitant use may increase the risk of hypoglycemia: Alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle.

Monitoring Parameters Regular assessment of fasting blood glucose, postprandial blood glucose, and hemoglobin A_{1c}; initial and periodic monitoring of hematologic parameters (eg, hemoglobin/hematocrit, red blood cell indices) and renal function should be performed at least annually. Evaluation of vitamin B_{12} and folate should be performed if anemia is present.

Reference Range Recommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsRegular assessment of fasting blood glucose, postprandial blood glucose, and hemoglobin A_{1c}; initial and periodic monitoring of hematologic parameters (eg, hemoglobin/hematocrit, red blood cell indices) and renal function should be performed at least annually. Evaluation of vitamin B_{12} and folate should be performed if anemia is present.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

- PrandiMet™:
  - 1/500: Repaglinide 1 mg and metformin hydrochloride 500 mg
  - 2/500: Repaglinide 2 mg and metformin hydrochloride 500 mg

Generic AvailableNo

ManufacturerNovo Nordisk Inc

Mechanism of ActionCombination therapy; repaglinide and metformin act to improve glycemic control via two different mechanisms of action:

Repaglinide is a nonsulfonylurea hypoglycemic agent which stimulates insulin release by blocking ATP-dependent potassium channels, depolarizing the membrane and facilitating calcium entry through calcium channels; increased intracellular calcium stimulates insulin release from the pancreatic beta cells.

Metformin prevents hyperglycemia by decreasing hepatic glucose production, decreasing intestinal absorption of glucose, and improving insulin sensitivity via increased peripheral glucose uptake and utilization.

Pharmacodynamics/KineticsSee individual agents.

Repaglinide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Prandin® may be confused with Avandia®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(re PAG li nide)
U.S. Brand NamesPrandin®
Canadian Brand NamesGlucoNorm®; Prandin®
Pharmacologic CategoryAntidiabetic Agent, Meglitinide Derivative
Use: Labeled IndicationsManagement of type 2 diabetes mellitus (noninsulin dependent, NIDDM) as an adjunct to diet and exercise; may be used in combination with metformin or thiazolidinediones
Dosing: Adults

Type 2 diabetes: Oral:

Note: Doses should be taken within 15 minutes of the meal, but time may vary from immediately preceding the meal to as long as 30 minutes before the meal

Patients not previously treated or whose Hb A_{1c} is <8%: Initial: 0.5 mg before each meal

Patients previously treated with blood glucose-lowering agents whose Hb A_{1c} is ≥8%: Initial: 1 or 2 mg before each meal.

Dose adjustment: Determine dosing adjustments by blood glucose response, usually fasting blood glucose. Double the preprandial dose up to 4 mg until satisfactory blood glucose response is achieved. At least 1 week should elapse to assess response after each dose adjustment.

Dose range: 0.5-4 mg taken with meals. Repaglinide may be dosed preprandial 2, 3, or 4 times/day in response to changes in the patient's meal pattern. Maximum recommended daily dose: 16 mg.

Patients receiving other oral hypoglycemic agents: When repaglinide is used to replace therapy with other oral hypoglycemic agents, it may be started the day after the final dose is given. Observe patients carefully for hypoglycemia because of potential overlapping of drug effects. When transferred from longer half-life sulfonylureas (eg, chlorpropamide), close monitoring may be indicated for up to ≥1 week.

Note: Combination therapy: If repaglinide monotherapy does not result in adequate glycemic control, metformin or a thiazolidinedione may be added. Or, if metformin or thiazolidinedione therapy does not provide adequate control, repaglinide may be added. The starting dose and dose adjustments for combination therapy are the same as repaglinide monotherapy. Carefully adjust the dose of each drug to determine the minimal dose required to achieve the desired pharmacologic effect. Failure to do so could result in an increase in the incidence of hypoglycemic episodes. Use appropriate monitoring of FPG and Hb A_{1c} measurements to ensure that the patient is not subjected to excessive drug exposure or increased probability of secondary drug failure. If glucose is not achieved after a suitable trial of combination therapy, consider discontinuing these drugs and using insulin.

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal Impairment

Cl_{cr} 40-80 mL/minute (mild to moderate renal dysfunction): Initial dosage adjustment does not appear to be necessary.

Cl_{cr} 20-40 mL/minute: Initiate 0.5 mg with meals; titrate carefully.

Cl_{cr} <20 mL/minute: Not studied.

Dosing: Hepatic ImpairmentUse conservative initial and maintenance doses. Use longer intervals between dosage adjustments.
Calculations

- Creatinine Clearance: Adults

Administration: OralAdminister repaglinide 15-30 minutes before meals. Patients who are anorexic or NPO, may need to have their dose held to avoid hypoglycemia. Patients consuming extra meals should be instructed to add a dose for the extra meal.
Dietary ConsiderationsAdminister repaglinide 15-30 minutes before meals. Dietary modification based on ADA recommendations is a part of therapy. May cause hypoglycemia. Must be able to recognize symptoms of hypoglycemia (palpitations, tachycardia, sweaty palms, diaphoresis, lightheadedness).
StorageDo not store above 25°C (77°F). Protect from moisture.

ContraindicationsHypersensitivity to repaglinide or any component of the formulation; diabetic ketoacidosis, with or without coma (treat with insulin); type 1 diabetes (insulin dependent, IDDM)

Warnings/Precautions

Concerns related to adverse effects:

- Hypoglycemia: May cause hypoglycemia; appropriate patient selection, dosage, and patient education are important to avoid hypoglycemic episodes.

Disease-related concerns:

- Adrenal/pituitary impairment: Use with caution in patients with adrenal and/or pituitary impairment; may be more susceptible to glucose-lowering effects.
- Cardiovascular mortality: Some studies suggest that sulfonylureas may be associated with increased cardiovascular events. Theoretically, repaglinide may also increase cardiovascular events, but there are no long-term studies assessing this concern.
- Hepatic impairment: Use with caution in patients with moderate-to-severe hepatic impairment.
- Renal impairment: Use with caution in patients with severe renal impairment; may be more susceptible to glucose-lowering effects.
- Stress-related states: It may be necessary to discontinue repaglinide and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Concurrent drug therapy issues:

- NPH insulin: Not indicated for use in combination with NPH insulin; in two studies, reports of myocardial ischemia (6 events) in patients using repaglinide plus insulin have caused concern. Further evaluation is required to assess the safety of this combination.

Special populations:

- Elderly: Use with caution in the elderly; may be more susceptible to glucose-lowering effects.
- Malnourished patients: Use with caution in malnourished patients; may be more susceptible to glucose-lowering effects.
- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsRepaglinide has not been studied exclusively in the elderly; information from the manufacturer states that no differences in its effectiveness or adverse effects had been identified between persons younger than and older than 65 years of age. How “tightly” a geriatric patient's blood glucose should be controlled is controversial; however, a fasting blood glucose <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional status, how well he/she recognizes hypoglycemic or hyperglycemic symptoms, and how to respond to them and their other disease states. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed in some animal studies; therefore, repaglinide is classified as pregnancy category C. Information describing the effects of repaglinide on pregnancy outcomes is limited. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Diabetes can also be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the mother and the fetus. Until additional safety and efficacy data are obtained, the use of oral agents is generally not recommended as routine management of GDM or type 2 diabetes mellitus during pregnancy. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if repaglinide is excreted in breast milk. Breast-feeding is not recommended by the manufacturer.

Pregnancy & Lactation, In-Depth

- Repaglinide in Pregnancy & Lactation

Adverse Reactions

>10%:

Central nervous system: Headache (9% to 11%)

Endocrine & metabolic: Hypoglycemia (16% to 31%)

Respiratory: Upper respiratory tract infection (10% to 16%)

1% to 10%:

Cardiovascular: Ischemia (4%), chest pain (2% to 3%)

Gastrointestinal: Diarrhea (4% to 5%), constipation (2% to 3%), tooth disorder (≤2%)

Genitourinary: Urinary tract infection (2% to 3%)

Neuromuscular & skeletal: Arthralgia (3% to 6%), back pain (5% to 6%)

Respiratory: Sinusitis (3% to 6%), bronchitis (2% to 6%)

Miscellaneous: Allergy (1% to 2%)

<1%: Anaphylactoid reaction, arrhythmia, ECG abnormal, hepatitis, hypertension, jaundice, leukopenia, liver function tests increased, MI, palpitation, thrombocytopenia

Postmarketing and/or case reports: Alopecia, hemolytic anemia, hepatic dysfunction (severe), pancreatitis, Stevens-Johnson syndrome

Metabolism/Transport Effects**Substrate** of CYP2C8 (major), 3A4 (major)

Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Repaglinide. Management: Concurrent use of an azole antifungal with both repaglinide and gemfibrozil should be avoided. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

CycloSPORINE: May increase the serum concentration of Repaglinide. *Risk C: Monitor therapy*

CYP2C8 Inducers (Highly Effective): May increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Moderate): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Strong): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Gemfibrozil: May increase the serum concentration of Repaglinide. The addition of itraconazole may augment the effect of gemfibrozil on repaglinide. Management: Consider alternative therapy combinations to avoid this potentially significant interaction. Avoid concurrent use when also used with a CYP3A4 inhibitor. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Macrolide Antibiotics: May increase the serum concentration of Repaglinide. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Repaglinide. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Trimethoprim: May decrease the metabolism of Repaglinide. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may cause hypoglycemia).

Food: When given with food, the AUC of repaglinide is decreased.

Herb/Nutraceutical: St John's wort may decrease repaglinide levels. Avoid gymnema, garlic (may cause hypoglycemia).

Monitoring ParametersMonitor fasting blood glucose (periodically) and glycosylated hemoglobin (Hb A_{1c}) levels (every 3 months) with a goal of decreasing these levels towards the normal range. During dose adjustment, fasting glucose can be used to determine response.

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (especially anything that is metabolized via the cytochrome P450 isoenzyme 3A4 route). Assess results of laboratory tests and patient response on a regular basis throughout therapy. Teach patient proper use (or refer patient to diabetic educator), possible side effects/appropriate interventions, and adverse symptoms to report (eg, signs of hypoglycemia).

Monitoring: Lab TestsFasting blood glucose (periodically) and glycosylated hemoglobin (Hb A_{1c}) levels (every 3 months)

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take this medication exactly as directed (3-4 times a day) 15-30 minutes prior to a meal. If you skip a meal (or add an extra meal), skip (or add) a dose for that meal. Do not change dosage or discontinue without consulting prescriber. Follow dietary and lifestyle directions of prescriber or diabetic educator. Avoid alcohol. You will be instructed in signs of hypo- or hyperglycemia by prescriber or diabetic educator; be alert for adverse hypoglycemia (lightheadedness, tachycardia or palpitations, sweaty palms or profuse perspiration, yawning, tingling of lips and tongue, seizures, or change in sensorium) and follow prescriber's instructions for intervention. May cause headache or mild GI effects during first weeks of therapy (nausea, vomiting, diarrhea, constipation, heartburn), if these do not diminish, consult prescriber for approved medication. Report chest pain; respiratory difficulty or symptoms of upper respiratory infection; urinary tract infection (burning or itching on urination); muscle pain or back pain; or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Prandin®: 0.5 mg, 1 mg, 2 mg

Generic AvailableNo

ManufacturerNovo Nordisk Pharm, Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Prandin)

0.5 mg (30): $65.69

1 mg (90): $175.19

2 mg (90): $175.19

Mechanism of ActionNonsulfonylurea hypoglycemic agent of the meglitinide class (the nonsulfonylurea moiety of glyburide) used in the management of type 2 diabetes mellitus; stimulates insulin release from the pancreatic beta cells

Pharmacodynamics/Kinetics

Onset of action: Single dose: Increased insulin levels: ~15-60 minutes

Duration: 4-6 hours

Absorption: Rapid and complete

Distribution: V_d: 31 L

Protein binding, plasma: >98% to albumin

Metabolism: Hepatic via CYP3A4 and CYP2C8 isoenzymes and glucuronidation to inactive metabolites

Bioavailability: Mean absolute: ~56%

Half-life elimination: ~1 hour

Time to peak, plasma: ~1 hour

Excretion: Within 96 hours: Feces (~90%, <2% as parent drug); Urine (~8%)

Related Information

- Diabetes Mellitus Management, Adults

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Tooth disorder.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentRepaglinide is a CYP3A4 substrate; monitor glucose when used with an enzyme inducer (carbamazepine, barbiturates) or an inhibitor (nefazodone, fluvoxamine)

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Reserpine may be confused with Risperdal®, risperidone

Pronunciation(re SER peen)

Pharmacologic CategoryCentral Monoamine-Depleting Agent; Rauwolfia Alkaloid

Use: Labeled IndicationsManagement of mild-to-moderate hypertension; treatment of agitated psychotic states (schizophrenia)

Use: Unlabeled/InvestigationalManagement of tardive dyskinesia

Dosing: Adults

Hypertension:

Manufacturer's labeling: Initial: 0.5 mg/day for 1-2 weeks; maintenance: 0.1-0.25 mg/day

Note: Clinically, the need for a “loading” period (as recommended by the manufacturer) is not well supported, and alternative dosing is preferred.

Alternative dosing (unlabeled): Initial: 0.1 mg once daily; adjust as necessary based on response.

Usual dose range (JNC 7): 0.05-0.25 mg once daily; 0.1 mg every other day may be given to achieve 0.05 mg once daily

Schizophrenia (labeled use) or tardive dyskinesia (unlabeled use): Dosing recommendations vary; initial dose recommendations generally range from 0.05-0.25 mg (although manufacturer recommends 0.5 mg once daily initially in schizophrenia). May be increased in increments of 0.1-0.25 mg; maximum dose in tardive dyskinesia: 5 mg/day.

Dosing: ElderlyOral: Initial: 0.05 mg once daily increasing by 0.05 mg every week as necessary (full antihypertensive effects may take as long as 3 weeks).

Dosing: PediatricChildren: Hypertension: 0.01-0.02 mg/kg/24 hours divided every 12 hours; maximum dose: 0.25 mg/day (not recommended in children)

Dosing: Renal Impairment

Cl_{cr} <10 mL/minute: Avoid use.

Not removed by hemo- or peritoneal dialysis; supplemental dose is not necessary.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

StorageProtect oral dosage forms from light.

ContraindicationsHypersensitivity to reserpine or any component of the formulation; active peptic ulcer disease, ulcerative colitis; history of mental depression (especially with suicidal tendencies); patients receiving electroconvulsive therapy (ECT)

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: At high doses, significant mental depression, anxiety, or psychosis may occur (uncommon at dosages <0.25 mg/day).
- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of hypotension or in patients where transient hypotensive episodes would be poorly tolerated (cardiovascular disease or cerebrovascular disease).

Disease-related concerns:

- Asthma: Use with caution in patients with asthma.
- Gallstones: Use with caution in patients with gallstones.
- Gastrointestinal disease: Use with caution in patients with inflammatory bowel disease or history of peptic ulcer disease.
- Parkinson's disease: Use with caution in patients with Parkinson’s disease.
- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- MAO inhibitors: Avoid concurrent use of MAO inhibitors and/or drugs with MAO-inhibiting properties.

Special populations:

- Elderly: Use with caution in the elderly.

Dosage form specific issues:

- Tartrazine: Some products may contain tartrazine.

Other warnings/precautions:

- Electroshock therapy: Discontinue reserpine 7 days before electroshock therapy.

Geriatric ConsiderationsSome studies advocate the use of reserpine because of its low cost, long half-life, and efficacy, but it is generally not considered a first-line drug.
Pregnancy Risk FactorC
LactationEnters breast milk/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmia, bradycardia, chest pain, hypotension, peripheral edema, PVC, syncope

Central nervous system: Dizziness, drowsiness, dull sensorium, fatigue, headache, mental depression, nightmares, nervousness, parkinsonism, paradoxical anxiety

Dermatologic: Flushing of skin, pruritus, purpura, rash

Endocrine & metabolic: Gynecomastia, weight gain

Gastrointestinal: Anorexia, diarrhea, dry mouth, gastric acid secretion increased, nausea, salivation increased, vomiting

Genitourinary: Impotence, libido decreased

Hematologic: Thrombocytopenia purpura

Neuromuscular & skeletal: Muscle ache

Ocular: Blurred vision, optic atrophy

Respiratory: Dyspnea, epistaxis, nasal congstion

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Amphetamines: Gastrointestinal Acidifying Agents may decrease the serum concentration of Amphetamines. *Risk C: Monitor therapy*

Beta-Blockers: Reserpine may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Iobenguane I 123: Reserpine may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the adverse/toxic effect of Rauwolfia Alkaloids. Existing MAOI therapy can result in paradoxical effects of added rauwolfia alkaloids (eg, excitation, hypertension). *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Tetrabenazine: Reserpine may enhance the adverse/toxic effect of Tetrabenazine. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe (may worsen hypertension). Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression). Avoid garlic (may have increased antihypertensive effect).

Monitoring ParametersBlood pressure, standing and sitting/supine

Nursing: Physical Assessment/MonitoringUse caution and monitor closely with a history of depression, PUD, or gallstones. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, increase hypotensive effect (TCAs), hypertensive reaction (MAO-Is, ephedra, yohimbe), increased effects of toxicity (CNS depressants). Assess blood pressure and cardiac status prior to starting therapy, during first doses, when changing dose, and regularly thereafter (eg, arrhythmia, hypotension, CNS changes [nervousness, depression], Parkinsonism, rash, diarrhea, nausea, vomiting). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy without consulting prescriber (especially any sleep remedies or stimulants). Take as directed; do not alter dose or discontinue without consulting prescriber. May take up to 2 weeks to see effects of therapy. Avoid alcohol and maintain recommended diet. May cause mild nervousness, dizziness, or fatigue (use caution when driving or engaging in hazardous activities until response to drug is known); orthostatic hypotension (use caution when rising from sitting or lying position or when climbing stairs until response to therapy is known): nausea or loss of appetite (small frequent meals or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); nasal stuffiness (avoid OTC medications and consult prescriber for approved medication); or impotence (will resolve when medication is discontinued). Report chest pain, rapid heartbeat, or palpitations; respiratory difficulty; sudden increase in weight; swelling in ankles or hands; black tarry stools; or unusual feelings of depression, alteration in gait or balance, or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 0.1 mg, 0.25 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Reserpine)

0.25 mg (30): $39.56

Mechanism of ActionReduces blood pressure via depletion of sympathetic biogenic amines (norepinephrine and dopamine); this also commonly results in sedative effects

Pharmacodynamics/Kinetics

Onset of action: Antihypertensive: 3-6 days

Duration: 2-6 weeks

Absorption: ~40%

Distribution: Crosses placenta; enters breast milk

Protein binding: 96%

Metabolism: Extensively hepatic (>90%)

Half-life elimination: 50-100 hours

Excretion: Feces (30% to 60%); urine (10%)

Related Information

- Depression
- Hypertension

Pharmacotherapy PearlsAdverse effects are usually dose related, mild, and infrequent when administered for the management of hypertension.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, nightmares, and drowsiness; high dose may cause depression, anxiety, or psychosis

Mental Health: Effects on Psychiatric TreatmentContraindicated in depression and with MAO inhibitors. Discontinue reserpine 7 days before ECT. Combined use with CNS depressants may produce additive effects. TCAs may diminish reserpine's antihypertensive effects.

Cardiovascular ConsiderationsCurrently, reserpine is used only infrequently for treatment of hypertension. An important side effect is drowsiness. It is important that reserpine be discontinued at least 1 week before elective electroshock therapy.

Anesthesia and Critical Care Concerns/Other ConsiderationsCurrently, reserpine is used only infrequently for treatment of hypertension. Nasal congestion, sedation, depression, and activation of peptic ulcer are important adverse effects.

Retapamulin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(re te PAM ue lin)
U.S. Brand NamesAltabax™
Pharmacologic CategoryAntibiotic, Pleuromutilin; Antibiotic, Topical
Use: Labeled IndicationsTreatment of impetigo caused by susceptible strains of *S. pyogenes* or methicillin-susceptible *S. aureus*
Dosing: Adults**Impetigo:** Topical: Apply to affected area twice daily for 5 days. Total treatment area should not exceed 100 cm^2 total body surface area.
Dosing: Pediatric**Impetigo:** Children ≥9 months: Topical: Apply to affected area twice daily for 5 days. Total treatment area should not exceed 2% of total body surface area.
Administration: TopicalMay cover treatment area with sterile bandage or gauze dressing if needed. Concomitant use with other topical products to the same treatment area has not been evaluated.
StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to retapamulin or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Irritation: If skin irritation occurs, discontinue use.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <9 months of age.

Other warnings/precautions:

- Appropriate use: For external use only; not for intranasal, intravaginal, ophthalmic, oral, or mucosal application. For treatment of impetigo covering up to 100 cm^2 total area in adults, or 2% of total body surface area in children. Concomitant use with other topical products to the same treatment area has not been evaluated.

Geriatric ConsiderationsNo specific recommendations for elderly patients.
Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

1% to 10%:

Central nervous system: Headache (1% to 2%), pyrexia (1%)

Dermatologic: Pruritus (2%), eczema (1%)

Gastrointestinal: Diarrhea (1% to 2%), nausea (1%)

Local: Application site irritation (2%), application site pruritus (2%)

Respiratory: Nasopharyngitis (1% to 2%)

<1%: Application site erythema, contact dermatitis, creatinine phosphokinase increased

Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringFor external use only to treat or prevent infections proven or suspected to be caused by susceptible bacteria. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Patient EducationThis medication is for external use only; do not swallow, and do not use in the eyes, on the mouth or lips, inside the nose, or inside the female genital area. Do not take any other prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber. Use for the full time recommended by prescriber, even if symptoms have improved. Apply to affected area as directed; may cover treatment area with sterile bandage or gauze dressing. Wash hands thoroughly after applying (if hands are not the area for treatment). Report immediately if the application area worsens with increased irritation, redness, itching, burning, swelling, blistering, or oozing. Notify prescriber if there is no improvement in symptoms within 3-4 days after starting use.
Dosage Forms

Ointment, topical:

Altabax™: 1% (5 g, 10 g, 15 g)

Generic AvailableNo
ManufacturerGlaxoSmithKline
Pricing: U.S. (www.drugstore.com)

Ointment (Altabax)

1% (5): $46.99

1% (10): $71.01

1% (15): $86.69

Mechanism of ActionPrimarily bacteriostatic. Inhibits normal bacterial protein biosynthesis by binding at a unique site (protein L3) on the ribosomal 50S subunit; prevents formation of active 50S ribosomal subunits by inhibiting peptidyl transfer and blocking P-site interactions at this site

Pharmacodynamics/Kinetics

Absorption: Topical: Low; increased when applied to abraded skin

Protein binding: 94%

Metabolism: Hepatic via CYP 3A4; extensively metabolized by mono-oxygenation and di-oxygenation to multiple metabolites

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (I.V.) among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(RE ta plase)
U.S. Brand NamesRetavase®
Canadian Brand NamesRetavase®
Pharmacologic Category[Thrombolytic Agent]
Use: Labeled IndicationsManagement of ST-elevation myocardial infarction (STEMI); improvement of ventricular function; reduction of the incidence of CHF and the reduction of mortality following AMI

Recommended criteria for treatment: STEMI: Chest pain ≥20 minutes duration, onset of chest pain within 12 hours of treatment (or within prior 12-24 hours in patients with continuing ischemic symptoms), and ST-segment elevation >0.1 mV in at least two contiguous precordial leads or two adjacent limb leads on ECG or new or presumably new left bundle branch block (LBBB)

Dosing: Adults

STEMI: I.V.: 10 units I.V. over 2 minutes, followed by a second dose 30 minutes later of 10 units I.V. over 2 minutes; withhold second dose if serious bleeding or anaphylaxis occurs.

Note: All patients should receive 162-325 mg of chewable nonenteric coated aspirin as soon as possible and then daily. Administer concurrently with heparin 60 units/kg bolus (maximum: 4000 units) followed by continuous infusion of 12 units/kg/hour (maximum: 1000 units/hour) and adjust to aPTT target of 50-70 seconds (or 1.5-2 times the upper limit of control).

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricNot recommended
Administration: I.V.Infuse over 2 minutes.
Administration: I.V. DetailNo other medications should be added to the injection solution.
StorageDosage kits should be stored at 2°C to 25°C (36°F to 77°F) and remain sealed until use in order to protect from light.
ReconstitutionReteplase should be reconstituted using the diluent, syringe, needle, and dispensing pin provided with each kit.
ContraindicationsHypersensitivity to reteplase or any component of the formulation; active internal bleeding; history of cerebrovascular accident; recent intracranial or intraspinal surgery or trauma; intracranial neoplasm, arteriovenous malformations, or aneurysm; known bleeding diathesis; severe uncontrolled hypertension
Allergy Considerations

- Thrombolytic Agent, Fibrin-Specific Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis: Rare anaphylactic reactions can occur.
- Arrhythmias: Coronary thrombolysis may result in reperfusion arrhythmias.
- Bleeding: Monitor all potential bleeding sites. If serious bleeding occurs, the infusion of reteplase and heparin should be stopped.
- Cholesterol embolism: Has rarely been reported.

Disease-related concerns:

- Conditions that increase bleeding risk: For the following conditions the risk of bleeding is higher with use of reteplase and should be weighed against the benefits of therapy: recent (within 10 days) major surgery (eg, CABG, obstetrical delivery, organ biopsy, previous puncture of noncompressible vessels), cerebrovascular disease, recent gastrointestinal or genitourinary bleeding, recent trauma including CPR, hypertension (systolic BP >180 mm Hg and/or diastolic BP >110 mm Hg), high likelihood of left heart thrombus (eg, mitral stenosis with atrial fibrillation), acute pericarditis, subacute bacterial endocarditis, hemostatic defects including ones caused by severe renal or hepatic dysfunction, significant hepatic dysfunction, diabetic hemorrhagic retinopathy or other hemorrhagic ophthalmic conditions, septic thrombophlebitis or occluded AV cannula at seriously infected site, or any other condition in which bleeding constitutes a significant hazard or would be particularly difficult to manage because of location.
- Myocardial infarct (MI): Appropriate use: Follow standard management for MI while infusing reteplase.

Concurrent drug therapy issues:

- Anticoagulants: Use with caution in patients receiving oral anticoagulants; increased risk of bleeding.

- Heparin: Concurrent heparin anticoagulation may contribute to bleeding.

Special populations:

- Elderly: Use with caution in patients with advanced age (eg, >75 years); increased risk of bleeding.
- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: Use with caution in pregnancy; increased risk of bleeding.

Other warnings/precautions:

- Administration: Intramuscular injections and nonessential handling of the patient should be avoided. Venipunctures should be performed carefully and only when necessary. If arterial puncture is necessary, use an upper extremity vessel that can be manually compressed.

Geriatric ConsiderationsNo specific changes in use in the elderly are necessary.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsBleeding is the most frequent adverse effect associated with reteplase. Heparin and aspirin have been administered concurrently with reteplase in clinical trials. The incidence of adverse events is a reflection of these combined therapies, and are comparable with comparison thrombolytics.

>10%: Local: Injection site bleeding (4.6% to 48.6%)

1% to 10%:

Gastrointestinal: Bleeding (1.8% to 9.0%)

Genitourinary: Bleeding (0.9% to 9.5%)

Hematologic: Anemia (0.9% to 2.6%)

<1% (Limited to important or life-threatening): Intracranial hemorrhage (0.8%), allergic/anaphylactoid reactions, cholesterol embolization

Other adverse effects noted are frequently associated with MI (and therefore may or may not be attributable to Retavase®) and include arrhythmia, hypotension, cardiogenic shock, pulmonary edema, cardiac arrest, reinfarction, pericarditis, tamponade, thrombosis, and embolism.

Drug Interactions

Anticoagulants: Thrombolytic Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Aprotinin: May diminish the therapeutic effect of Thrombolytic Agents. *Risk D: Consider therapy modification*

Drotrecogin Alfa: Thrombolytic Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Thrombolytic Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Monitoring ParametersMonitor for signs of bleeding (hematuria, GI bleeding, gingival bleeding)
Nursing: Physical Assessment/MonitoringUse caution when there is significant risk of bleeding (see Warnings/Precautions for specific use cautions). Assess potential risk interactions with other pharmacological and herbal products patient may be taking (especially those medications that may affect coagulation or platelet function). See Administration for infusion specifics. Patient should be closely monitored for bleeding during and following treatment: infusion site, neurological status (eg, intracranial hemorrhage), vital signs, and ECG. Bleeding precautions should be maintained; avoid I.M. injections, venipunctures (unless absolutely necessary), and nonessential handling of the patient. If arterial puncture is necessary, use an upper extremity vessel that can be manually compressed. Patient instructions determined by patient condition.
Monitoring: Lab TestsCBC, PTT, signs and symptoms of bleeding, ECG monitoring
Patient EducationThis medication can only be administered by infusion; you will be monitored closely during and after treatment. You will have a tendency to bleed easily; use caution to prevent injury (use electric razor, soft toothbrush, and caution with knives, needles, or anything sharp). Follow instructions for strict bedrest to reduce the risk of injury. If bleeding occurs, report immediately and apply pressure to bleeding spot until bleeding stops completely. Report unusual pain (acute headache, joint pain, chest pain); unusual bruising or bleeding; blood in urine, stool, or vomitus; bleeding gums; vision changes; or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Retavase®: 10.4 units [equivalent to reteplase 18.1 mg; contains sucrose and polysorbate 80; packaged with sterile water for injection]

Generic AvailableNo

ManufacturerCentocor, Inc

Mechanism of ActionReteplase is a nonglycosylated form of tPA produced by recombinant DNA technology using *E. coli*; it initiates local fibrinolysis by binding to fibrin in a thrombus (clot) and converts entrapped plasminogen to plasmin

Pharmacodynamics/Kinetics

Onset of action: Thrombolysis: 30-90 minutes

Half-life elimination: 13-16 minutes

Excretion: Feces and urine

Clearance: Plasma: 250-450 mL/minute

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular Considerations

ST-Elevation Myocardial Infarction: The 2004 ACC/AHA guidelines for the management of patients with acute myocardial infarction recommend prehospital thrombolysis in special circumstances (eg, transport time >30 minutes). Efforts to quickly identify and safely treat appropriate candidates for therapy continue. Reducing treatment delays is very important to improve mortality. Thrombolytic therapy is indicated in patients with ST-segment elevation of >1 mm in two or more contiguous leads or at least 2 adjacent limb leads in patients with chest discomfort >30 minutes but ≤12 hours. Patients with chest discomfort suggestive of ischemia and new-onset left bundle branch block (LBBB) are also candidates for thrombolysis. Generally there is only a small trend for benefit of therapy after a delay of more than 12-24 hours, but thrombolysis may be considered for selected patients with ongoing ischemic pain and extensive ST elevation. Additional absolute contraindications for fibrinolysis use in ST-elevation myocardial infarction from the 2004 ACC/AHA guidelines: Any prior intracranial hemorrhage, ischemic stroke within 3 months (except one within 3 hours), significant closed head or facial trauma within 3 months. Additional relative contraindications include history of chronic severe, poorly-controlled hypertension, severe uncontrolled hypertension on presentation (systolic BP >180 mm Hg or diastolic >110 mm Hg; could be an absolute contraindication in low-risk patients), history of prior ischemic stroke > 3 months, dementia, or known intracranial pathology, traumatic or prolonged (>10 minutes) CPR or major surgery (<3 weeks), recent (within 2-4 weeks) internal bleeding, noncompressible vascular punctures, pregnancy, active peptic ulcer, current use of anticoagulants.

Thrombolytic and GP IIb/IIIa Inhibitor: In the GUSTO V trial, patients with acute MI were randomized to standard-dose reteplase or half-dose reteplase (two boluses of 5 units each, 30 minutes apart) and full dose abciximab. Thirty-day mortality (primary endpoint) was similar in both groups. The combination treatment group had fewer deaths or nonfatal reinfarctions, less need for urgent revascularization, fewer major ischemic complications. More bleeding occurred in the combination treatment group, but intracranial hemorrhage and nonfatal disabling stroke were similar in both groups. All cause mortality at one year was similar in both groups. In TIMI 14, the combination of full-dose abciximab (0.25 mg/kg bolus followed by a 12-hour infusion of 0.125 mcg/kg/minute, maximum 10 mcg/minute) and half-dose alteplase (15 mg bolus followed by 35 mg infusion over 60 minutes) resulted in 74% of patients achieving TIMI grade 3 flow at 90 minutes. The 2004 ACC/AHA guidelines for the management of patients with acute myocardial infarction suggests that abciximab and half-dose reteplase or tenecteplase may be considered for prevention of reinfarction in patients with an anterior MI, who <75 years of age and have no risk factors for bleeding.

However, more recently, the 2008 American College of Chest Physicians guidelines recommends against the combination of half-dose reteplase or tenecteplase and standard-dose abciximab (with low dose unfractionated heparin) in any patient with STEMI due to the lack of mortality benefit and the risk of major bleeding (Goodman, 2008).

Anesthesia and Critical Care Concerns/Other Considerations

Evidence-Based Information:

Management of Intracerebral Hemorrhage (ICH) Due to Thrombolysis: Overall management of ICH is similar regardless of cause; however, iatrogenic spontaneous ICH may have specific treatments. According to the 2007 ACC/ASA Guidelines for the Management of Spontaneous Intracerebral Hemorrhage, fibrinolytic-related ICH should be treated with infusion of platelets (6-8 units) and cryoprecipitate which contains factor VIII (Class IIb recommendation).

$_o$(D) Immune Globulin'; return;">

Rh$_o$(D) Immune Globulin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(ar aych oh (dee) i MYUN GLOB yoo lin)

U.S. Brand NamesHyperRHO™ S/D Full Dose; HyperRHO™ S/D Mini Dose; MICRhoGAM®; RhoGAM®; Rhophylac®; WinRho® SDF

Canadian Brand NamesWinRho® SDF

Pharmacologic CategoryImmune Globulin

Use: Labeled Indications

Suppression of Rh isoimmunization: Use in the following situations when an Rh$_o$(D)-negative individual is exposed to Rh$_o$(D)-positive blood: During delivery of an Rh$_o$(D)-positive infant; abortion; amniocentesis; chorionic villus sampling; ruptured tubal pregnancy; abdominal trauma; hydatidiform mole; transplacental hemorrhage. Used when the mother is Rh$_o$(D) negative, the father of the child is either Rh$_o$(D) positive or Rh$_o$(D) unknown, the baby is either Rh$_o$(D) positive or Rh$_o$(D) unknown.

Transfusion: Suppression of Rh isoimmunization in Rh$_o$(D)-negative individuals transfused with Rh$_o$(D) antigen-positive RBCs or blood components containing Rh$_o$(D) antigen-positive RBCs

Treatment of idiopathic thrombocytopenic purpura (ITP): Used in the following nonsplenectomized Rh$_o$(D) positive individuals: Children with acute or chronic ITP, adults with chronic ITP, children and adults with ITP secondary to HIV infection

Dosing: Adults

ITP:

Rhophylac®: I.V.: 50 mcg/kg

WinRho® SDF: I.V.:

Initial: 50 mcg/kg as a single injection, or can be given as a divided dose on separate days. If hemoglobin is <10 g/dL: Dose should be reduced to 25-40 mcg/kg

Subsequent dosing: 25-60 mcg/kg can be used if required to elevate platelet count

Maintenance dosing if patient **did respond** to initial dosing: 25-60 mcg/kg based on platelet and hemoglobin levels

Maintenance dosing if patient **did not respond** to initial dosing:

Hemoglobin 8-10 g/dL: Redose between 25-40 mcg/kg

Hemoglobin >10 g/dL: Redose between 50-60 mcg/kg

Hemoglobin <8 g/dL: Use with caution

Rh$_o$(D) suppression:Note: One “full dose” (300 mcg) provides enough antibody to prevent Rh sensitization if the volume of RBC entering the circulation is ≤15 mL. When >15 mL is suspected, a fetal red cell count should be performed to determine the appropriate dose.

Pregnancy:

Antepartum prophylaxis: In general, dose is given at 28 weeks. If given early in pregnancy, administer every 12 weeks to ensure adequate levels of passively acquired anti-Rh

HyperRHO™ S/D Full Dose, RhoGAM®: I.M.: 300 mcg

Rhophylac®, WinRho® SDF: I.M., I.V.: 300 mcg

Postpartum prophylaxis: In general, dose is administered as soon as possible after delivery, preferably within 72 hours. Can be given up to 28 days following delivery

HyperRHO™ S/D Full Dose, RhoGAM®: I.M.: 300 mcg

Rhophylac®: I.M., I.V.: 300 mcg

WinRho® SDF: I.M., I.V.: 120 mcg

Threatened abortion, any time during pregnancy (with continuation of pregnancy):

HyperRHO™ S/D Full Dose, RhoGAM®: I.M.: 300 mcg; administer as soon as possible

Rhophylac®, WinRho® SDF: I.M./I.V.: 300 mcg; administer as soon as possible

Abortion, miscarriage, termination of ectopic pregnancy:

RhoGAM®: I.M.: ≥13 weeks gestation: 300 mcg.

HyperRHO™ S/D Mini Dose, MICRhoGAM®: <13 weeks gestation: I.M.: 50 mcg

Rhophylac®: I.M., I.V.: 300 mcg

WinRho® SDF: I.M., I.V.: After 34 weeks gestation: 120 mcg; administer immediately or within 72 hours

Amniocentesis, chorionic villus sampling:

HyperRHO™ S/D Full Dose, RhoGAM®: I.M.: At 15-18 weeks gestation or during the 3rd trimester: 300 mcg. If dose is given between 13-18 weeks, repeat at 26-28 weeks and within 72 hours of delivery.

Rhophylac®: I.M., I.V.: 300 mcg

WinRho® SDF: I.M., I.V.:

Before 34 weeks gestation: 300 mcg; administer immediately, repeat dose every 12 weeks during pregnancy

After 34 weeks gestation: 120 mcg, administered immediately or within 72 hours

Excessive fetomaternal hemorrhage (>15 mL): Rhophylac®: I.M., I.V.: 300 mcg within 72 hours plus 20 mcg/mL fetal RBCs in excess of 15 mL if excess transplacental bleeding is quantified **or** 300 mcg/dose if bleeding cannot be quantified

Abdominal trauma, manipulation:

HyperRHO™ S/D Full Dose, RhoGAM®: I.M.: 2nd or 3rd trimester: 300 mcg. If dose is given between 13-18 weeks, repeat at 26-28 weeks and within 72 hours of delivery.

Rhophylac®: I.M., I.V.: 300 mcg within 72 hours

WinRho® SDF: I.M., I.V.: After 34 weeks gestation: 120 mcg; administer immediately or within 72 hours

Transfusion:

HyperRHO™ S/D Full Dose, RhoGAM®: I.M.: Multiply the volume of Rh positive whole blood administered by the hematocrit of the donor unit to equal the volume of RBCs transfused. The volume of RBCs is then divided by 15 mL, providing the number of 300 mcg doses (vials/syringes) to administer. If the dose calculated results in a fraction, round up to the next higher whole 300 mcg dose (vial/syringe).

WinRho® SDF: Administer within 72 hours after exposure of incompatible blood transfusions or massive fetal hemorrhage.

I.V.: Calculate dose as follows; administer 600 mcg every 8 hours until the total dose is administered:

Exposure to Rh$_o$(D) positive whole blood: 9 mcg/mL blood

Exposure to Rh$_o$(D) positive red blood cells: 18 mcg/mL cells

I.M.: Calculate dose as follows; administer 1200 mcg every 12 hours until the total dose is administered:

Exposure to Rh$_o$(D) positive whole blood: 12 mcg/mL blood

Exposure to Rh$_o$(D) positive red blood cells: 24 mcg/mL cells

Rhophylac®: I.M., I.V.:20 mcg per 2 mL transfused blood or 1 mL erythrocyte concentrate

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**ITP, transfusion:** Rhophylac®, WinRho® SDF: Refer to adult dosing.
Dosing: Renal Impairment I.V. infusion: Use caution; may require infusion rate reduction or discontinuation.
Administration: I.MAdminister into the deltoid muscle of the upper arm or anterolateral aspect of the upper thigh. Avoid gluteal region due to risk of sciatic nerve injury. If large doses (>5 mL) are needed, administration in divided doses at different sites is recommended. **Note:** Do not administer I.M. Rho(D) immune globulin for ITP.
Administration: I.V.

WinRho® SDF: Infuse over at least 3-5 minutes; do not administer with other medications

Rhophylac®: ITP: Infuse at 2 mL per 15-60 seconds

Administration: I.V. Detail**Note:** If preparing dose using liquid formulation, withdraw the entire contents of the vial to ensure accurate calculation of the dosage requirement.
StorageStore at 2°C to 8°C (35°F to 46°F); do not freeze.

Rhophylac®: Protect from light.

ContraindicationsHypersensitivity to immune globulins or any component of the formulation; prior sensitization to Rh$_o$(D)
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis: Use with caution in patients with IgA deficiency, may contain trace amounts of IgA; patients who are IgA deficient may have the potential for developing IgA antibodies, anaphylactic reactions may occur.

- Intravascular hemolysis (IVH): Rare but serious signs and symptoms (eg, back pain, shaking, chills, fever, discolored urine; onset within 4 hours of infusion) of IVH have been reported in postmarketing experience in patients treated for ITP. Clinically-compromising anemia, acute renal insufficiency and disseminated intravascular coagulation (DIC) have also been reported. ITP patients should be advised of the signs and symptoms of IVH and instructed to report them immediately.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with thrombocytopenia or coagulation disorders; bleeding/hematoma may occur from I.M. administration.

- Immune globulin deficiency syndromes: Not for replacement therapy in immune globulin deficiency syndromes.

- ITP: Appropriate use: Safety and efficacy not established in Rh_o(D) negative, non-ITP thrombocytopenia, or splenectomized patients. Decrease dose with hemoglobin <10 g/dL; use with extreme caution if hemoglobin <8 g/dL. Do not administer I.M. or SubQ; administer dose I.V. only.

- Renal impairment: Use with caution in patients with renal impairment; may require an infusion rate reduction or discontinuation.

- Rh_o(D) suppression: For use in the mother; do not administer to the neonate.

Dosage form specific issues:

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.

- Maltose: Some products may contain maltose, which may result in falsely-elevated blood glucose readings.

- Rhophylac®: Safety and efficacy have not been established for Rhophylac® in patients with anemia.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have not been conducted. Available evidence suggests that Rh_o(D) immune globulin administration during pregnancy does not harm the fetus or affect future pregnancies.

LactationDoes not enter breast milk

Adverse ReactionsFrequency not defined.

Cardiovascular: Hyper-/hypotension, pallor, tachycardia, vasodilation

Central nervous system: Chills, dizziness, fever, headache, malaise, somnolence

Dermatologic: Pruritus, rash

Gastrointestinal: Abdominal pain, diarrhea, nausea, vomiting

Hematologic: Haptoglobin decreased, hemoglobin decreased (patients with ITP), intravascular hemolysis (patients with ITP)

Hepatic: Bilirubin increased, LDH increased

Local: Injection site reaction: Discomfort, induration, mild pain, redness, swelling

Neuromuscular & skeletal: Arthralgia, back pain, hyperkinesia, myalgia, weakness

Renal: Acute renal insufficiency

Miscellaneous: Anaphylaxis, diaphoresis, infusion-related reactions, positive anti-C antibody test (transient), shivering

Postmarketing and/or case reports: Anemia (clinically-compromising), DIC, dyspnea, erythema, hemoglobinuria (transient in patients with ITP), injection site irritation, vertigo

Drug Interactions

Vaccines (Live): Immune Globulins may diminish the therapeutic effect of Vaccines (Live). **Exceptions:** Influenza Virus Vaccine; Yellow Fever Vaccine. *Risk D: Consider therapy modification*

Test InteractionsSome infants born to women given Rh_o(D) antepartum have a weakly positive Coombs' test at birth. Fetal-maternal hemorrhage may cause false blood-typing result in the mother; when there is any doubt to the patients' Rh type, Rh_o(D) immune globulin should be administered. WinRho® SDF liquid contains maltose; may result in falsely elevated blood glucose levels with dehydrogenase pyrroloquinolinequinone or glucose-dye-oxidoreductase testing methods. WinRho® SDF contains trace amounts of anti-A, B, C and E; may alter Coombs' tests following administration.

Monitoring ParametersSigns and symptoms of intravascular hemolysis (IVH), anemia, and renal insufficiency; observe patient for side effects for at least 20 minutes following administration; patients with suspected IVH should have CBC, haptoglobin, plasma hemoglobin, urine dipstick, BUN, serum creatinine, liver function tests, DIC-specific tests (D-dimer, fibrin degradation products [FDP] or fibrin split products [FSP]) for differential diagnosis. Clinical response may be determined by monitoring platelets, red blood cell (RBC) counts, hemoglobin, and reticulocyte levels.

Nursing: Physical Assessment/MonitoringAssess results of laboratory tests, therapeutic effectiveness, and adverse reactions. Monitor blood pressure; may cause hyper- or hypotension. Teach patient possible side effects, interventions to reduce side effects, and adverse reactions to report.

Monitoring: Lab TestsPatients with suspected IVH should have CBC, haptoglobin, plasma hemoglobin, urine dipstick, BUN, serum creatinine, liver function tests, DIC-specific tests (D-dimer, fibrin degradation products [FDP] or fibrin split products [FSP]) for differential diagnosis.

Clinical response may be determined by monitoring platelets, red blood cell (RBC) counts, hemoglobin, and reticulocyte levels.

Patient EducationDo not have live virus vaccinations within 3 months of receiving this medication. This medication can only be administered by injection or infusion; report immediately any difficulty breathing, chills, rapid heart beat, back rash, pain, or redness, swelling, pain at injection site, discolored urine, decreased urine output, sudden weight gain, or swelling of extremities. You may experience headache or mild headache (consult prescriber for appropriate analgesic); or sleepiness or dizziness (avoid driving or engaging in activities requiring alertness until response to medication is known). Report any acute or persistent adverse effects. **Pregnancy precautions:** Inform prescriber if you are pregnant or plan to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution [preservative free]:

HyperRHO™ S/D Full Dose: 300 mcg [for I.M. use only]

HyperRHO™ S/D Mini Dose: 50 mcg [for I.M. use only]

MICRhoGAM®: 50 mcg [for I.M. use only; contains polysorbate 80]

RhoGAM®: 300 mcg [for I.M. use only; contains polysorbate 80]

Rhophylac®: 300 mcg/2 mL (2 mL) [1500 int. units; for I.M. or I.V. use; contains human albumin]

WinRho® SDF:

120 mcg/~0.5 mL (~0.5 mL) [600 int. units; contains maltose and polysorbate 80; for I.M. or I.V. use] [DSC]

300 mcg/~1.3 mL (~1.3 mL) [1500 int. units; contains maltose and polysorbate 80; for I.M. or I.V. use]

500 mcg/~2.2 mL (~2.2 mL) [2500 int. units; contains maltose and polysorbate 80; for I.M. or I.V. use]

1000 mcg/~4.4 mL (~4.4 mL) [5000 int. units; contains maltose and polysorbate 80; for I.M. or I.V. use]

3000 mcg/~13 mL (~13 mL) [15,000 int. units; contains maltose and polysorbate 80; for I.M. or I.V. use]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Injection (RhoGAM (Human))

300 mcg (5): $662.50

Mechanism of Action

Rh suppression: Prevents isoimmunization by suppressing the immune response and antibody formation by Rh_o(D) negative individuals to Rh_o(D) positive red blood cells.

ITP: Not completely characterized; Rh_o(D) immune globulin is thought to form anti-D-coated red blood cell complexes which bind to macrophage Fc receptors within the spleen; blocking or saturating the spleens ability to clear antibody-coated cells, including platelets. In this manner, platelets are spared from destruction.

Pharmacodynamics/Kinetics

Onset of platelet increase: ITP: Platelets should rise within 1-2 days

Peak effect: In 7-14 days

Duration: Suppression of Rh isoimmunization: ~12 weeks; Treatment of ITP: 30 days (variable)

Distribution: V_d: I.M.: 8.59 L

Bioavailability: I.M.: Rhophylac®: 69%

Half-life elimination: 12-30 days

Time to peak, plasma: I.M.: 5-10 days; I.V. (WinRho® SDF): ≤2 hours

Pharmacotherapy PearlsA “full dose” of Rh_o(D) immune globulin has previously been referred to as a 300 mcg dose. It is not the actual anti-D content. Although dosing has traditionally been expressed in mcg, potency is listed in int. units (1 mcg = 5 int. units). ITP patients requiring transfusions should be transfused with Rho-negative blood cells to avoid exacerbating hemolysis; platelet products may contain red blood cells; caution should be exercised if platelets are from Rh_o-positive donors.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness and sedation

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsRhIG; Rho(D) Immune Globulin (Human); RhoIGIV; RhoIVIM

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Ribavirin may be confused with riboflavin, rifampin, Robaxin®

Pronunciation(rye ba VYE rin)

U.S. Brand NamesCopegus®; Rebetol®; RibaPak™; Ribasphere®; Virazole®

Canadian Brand NamesVirazole®

Pharmacologic CategoryAntiviral Agent

Use: Labeled Indications

Inhalation: Treatment of patients with respiratory syncytial virus (RSV) infections; specially indicated for treatment of severe lower respiratory tract RSV infections in patients with an underlying compromising condition (prematurity, bronchopulmonary dysplasia and other chronic lung conditions, congenital heart disease, immunodeficiency, immunosuppression), and recent transplant recipients

Oral capsule:

In combination with interferon alfa-2b (Intron® A) injection for the treatment of chronic hepatitis C in patients with compensated liver disease who have relapsed after alpha interferon therapy or were previously untreated with alpha interferons

In combination with peginterferon alfa-2b (PEG-Intron®) injection for the treatment of chronic hepatitis C in patients with compensated liver disease who were previously untreated with alpha interferons

Oral solution: In combination with interferon alfa 2b (Intron® A) injection for the treatment of chronic hepatitis C in patients with compensated liver disease who were previously untreated with alpha interferons or patients who have relapsed after alpha interferon therapy

Oral tablet: In combination with peginterferon alfa-2a (Pegasys®) injection for the treatment of chronic hepatitis C in patients with compensated liver disease who were previously untreated with alpha interferons (includes patients with histological evidence of cirrhosis [Child-Pugh class A] and patients with clinically-stable HIV disease)

Use: Unlabeled/InvestigationalUsed in other viral infections including influenza A and B and adenovirus

Dosing: Adults

Chronic hepatitis C (in combination with peginterferon alfa-2a): Oral tablet (Copegus®):

Monoinfection, genotype 1,4:

<75 kg: 1000 mg/day, in 2 divided doses

≥75 kg: 1200 mg/day, in 2 divided doses

Monoinfection, genotype 2,3: 800 mg/day, in 2 divided doses

Coinfection with HIV: 800 mg/day in 2 divided doses

Note: Treatment duration may vary. Consult current guidelines and literature. Pretreatment platelets should be ≥90,000/mm^3 (75,000/mm^3 for cirrhosis or 70,000/mm^3 for coinfection with HIV), ANC ≥1500/mm^3, hemoglobin ≥12 g/dL for women and ≥13 g/dL for men (11 g/dL for HIV coinfected women and 12 g/dL for coinfected men), and TSH and T_4 within normal limits or controlled adequately. CD4+ cell count should be ≥200 cells/microL (or CD4+ count 100-200 cells/microL and HIV-1 RNA <5000 copies/mL) for coinfection with HIV.

Chronic hepatitis C (in combination with interferon alfa-2b): Oral capsule (Rebetol®, Ribasphere®):

≤75 kg: 400 mg in the morning, then 600 mg in the evening

>75 kg: 600 mg in the morning, then 600 mg in the evening

Note: Treatment duration may vary. Consult current guidelines and literature.

Chronic hepatitis C (in combination with peginterferon alfa-2b): Oral capsule (Rebetol®, Ribasphere®): 400 mg twice daily

Note: Treatment duration may vary. Consult current guidelines and literature.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

RSV infection: Infants and Children: Aerosol inhalation: Use with Viratek® small particle aerosol generator (SPAG-2): A concentration of 20 mg/mL (6 g reconstituted with 300 mL of sterile water without preservatives) administered for 12-18 hours/day for 3 days, up to 7 days in length.

Chronic hepatitis C (in combination with interferon alfa-2b): Oral solution should be used in children 3-5 years of age, children ≤25 kg, or those unable to swallow capsules.

Capsule/oral solution: Children ≥3 years: 15 mg/kg/day in 2 divided doses.

Capsule dosing recommendations:

25-36 kg: 400 mg/day (200 mg morning and evening)

37-49 kg: 600 mg/day (200 mg in the morning and 400 mg in the evening)

50-61 kg: 800 mg/day (400 mg in the morning and evening)

>61 kg: Refer to adult dosing.

Note: Treatment duration may vary. Consult current guidelines and literature.

Dosing: Renal ImpairmentCl_{cr} <50 mL/minute: Oral route is not recommended.

Dosing: Hepatic ImpairmentHepatic decompensation (Child-Pugh class B and C): Use of ribavirin tablets is contraindicated.

Dosing: Adjustment for ToxicityOral: Capsule, solution, tablet:

Patient **without** cardiac history:

Hemoglobin <10 g/dL:

Children: Decrease dose to 7.5 mg/kg/day

Adults: Decrease dose to 600 mg/day

Hemoglobin <8.5 g/dL: Children and Adults: Permanently discontinue treatment

Patient **with** cardiac history:

Hemoglobin has decreased ≥2 g/dL during any 4-week period of treatment:

Children: Decrease dose to 7.5 mg/kg/day

Adults: Decrease dose to 600 mg/day

Hemoglobin <12 g/dL after 4 weeks of reduced dose: Children and Adults: Permanently discontinue treatment

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister concurrently with interferon alfa injection. Capsule should not be opened, crushed, chewed, or broken. Capsules are not for use in children <5 years of age. Use oral solution for children 3-5 years, those ≤25 kg, or those who cannot swallow capsules.

Capsule, in combination with interferon alfa-2b: May be administered with or without food, but always in a consistent manner in regard to food intake.

Capsule, in combination with peginterferon alfa 2b: Administer with food.

Solution, in combination with interferon alfa-2b: May be administered with or without food, but always in a consistent manner in regard to food intake.

Tablet: Should be administered with food.

Administration: InhalationRibavirin should be administered in well-ventilated rooms (at least 6 air changes/hour). In mechanically-ventilated patients, ribavirin can potentially be deposited in the ventilator delivery system depending on temperature, humidity, and electrostatic forces; this deposition can lead to malfunction or obstruction of the expiratory valve, resulting in inadvertently high positive end-expiratory pressures. The use of one-way valves in the inspiratory lines, a breathing circuit filter in the expiratory line, and frequent monitoring and filter replacement have been effective in preventing these problems. Solutions in SPAG-2 unit should be discarded at least every 24 hours and when the liquid level is low before adding newly reconstituted solution. Should not be mixed with other aerosolized medication.

Dietary ConsiderationsWhen used in combination with interferon alfa-2b, capsules and solution may be taken with or without food, but always in a consistent manner in regard to food intake (ie, always take with food or always take on an empty stomach). When used in combination with peginterferon alfa 2b, capsules should be taken with food. Tablets should be taken with food.

Storage

Inhalation: Store vials in a dry place at 15°C to 30°C (59°F to 86°F).

Oral: Store at controlled room temperature of 25°C (77°F). Solution may also be refrigerated at 2°C to 8°C (36°F to 46°F).

ReconstitutionInhalation: Do not use any water containing an antimicrobial agent to reconstitute drug. Reconstituted solution is stable for 24 hours at room temperature.

CompatibilityInhalation: Should not be mixed with other aerosolized medication.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) for treatment of hepatitis C where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to ribavirin or any component of the formulation; women of childbearing age who will not use contraception reliably; pregnancy

Additional contraindications for oral formulation: Male partners of pregnant women; hemoglobinopathies (eg, thalassemia major, sickle cell anemia); patients with autoimmune hepatitis; ribavirin tablets are contraindicated in patients with hepatic decompensation (Child-Pugh class B and C)

Refer to individual monographs for Interferon Alfa-2b (Intron® A) and Peginterferon Alfa-2a (Pegasys®) for additional contraindication information.

Warnings/Precautions

Boxed warnings:

- Hemolytic anemia: See "Concerns related to adverse effects" below.
- Hepatitis C: See "Disease-related concerns" below.
- Inhalation: Ventilator patients: See "Dosage form specific issues" below.
- Pregnancy: See "Special populations" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Hemolytic anemia: **[U.S. Boxed Warning]: Hemolytic anemia is the primary toxicity of oral therapy; usually occurring within 1-2 weeks of therapy initiation;** observed in ~10% to 13% of patients when alfa interferons were combined with ribavirin. Assess cardiac function before initiation of therapy. Anemia associated with ribavirin may worsen underlying cardiac disease. Avoid use in patients with significant/unstable cardiac disease. If any deterioration in cardiovascular status occurs, discontinue therapy. Patients with renal dysfunction and/or those >50 years of age should be carefully assessed for development of anemia.

Disease-related concerns:

- Hepatic impairment: Discontinue therapy if evidence of hepatic decompensation (Child-Pugh score ≥6) is observed.
- Hepatitis C: Appropriate use: **[U.S. Boxed Warning]: Ribavirin monotherapy is not effective for chronic hepatitis C infection.**
- Renal impairment: Use with caution in patients with renal impairment; avoid use in patients with Cl_{cr} <50 mL/minute.

Concurrent drug therapy issues:

Combination therapy with alfa interferons:

- Autoimmune/infectious disorders: Have occurred with combination therapy; use with caution in patients with autoimmune disease or severe infection.
- Bone marrow suppression: Has occurred with combination therapy; discontinue if occurs.
- Dental and periodontal disorders: Have been reported with combination therapy; patients should be instructed to brush teeth twice daily and have regular dental exams. Xerostomia may contribute to and/or exacerbate dental disorders.
- Dermatologic reactions: Severe cutaneous reactions, including Stevens-Johnson syndrome and exfoliative dermatitis have been reported (rarely) with combination therapy; discontinue with signs or symptoms of severe skin reactions.
- Diabetes: Has occurred with combination therapy; monitor blood sugars closely.
- Hypersensitivity reactions: Acute hypersensitivity reactions (eg, anaphylaxis, angioedema, bronchoconstriction, and urticaria) have been observed (rarely) with combination therapy.
- Pancreatitis: Has occurred with combination therapy; discontinue therapy in suspected/confirmed pancreatitis.
- Psychiatric disorders: Severe psychiatric events have occurred including depression and suicidal behavior during combination therapy. Avoid use in patients with a psychiatric history; discontinue if severe psychiatric symptoms occur.
- Pulmonary events: Pulmonary symptoms (eg, dyspnea, pulmonary infiltrates, pneumonitis, pneumonia [rarely fatal]) have been associated with combination therapy; use with caution in patients with pulmonary disease, including sarcoidosis (exacerbation reported).

Special populations:

- Elderly: Use with caution in the elderly; may be more susceptible to adverse effects
- Pediatrics: Safety and efficacy of the oral products have not been established in children <3 years of age.

- Pregnancy: **[U.S. Boxed Warning]: Significant teratogenic effects have been observed in all animal studies.** A negative pregnancy test is required before initiation and monthly thereafter. Avoid pregnancy in female patients and female partners of male patients, during therapy, and for at least 6 months after treatment; two forms of contraception should be used.

Dosage form specific issues:

- Inhalation: **[U.S. Boxed Warning]: Use with caution in patients requiring assisted ventilation because precipitation of the drug in the respiratory equipment may interfere with safe and effective patient ventilation; sudden deterioration of respiratory function has been observed;** monitor carefully in patients with COPD and asthma for deterioration of respiratory function. Ribavirin is potentially mutagenic, tumor-promoting, and gonadotoxic. Although anemia has not been reported with inhalation therapy, consider monitoring for anemia 1-2 weeks post-treatment. Pregnant healthcare workers may consider unnecessary occupational exposure; ribavirin has been detected in healthcare workers' urine. Healthcare professionals or family members who are pregnant (or may become pregnant) should be counseled about potential risks of exposure and counseled about risk reduction strategies.

Other warnings/precautions:

- Appropriate use: Safety and efficacy have not been established in patients who have failed other alpha interferon therapy, received organ transplants, or been coinfected with hepatitis B or HIV (Copegus® may be used in HIV coinfected patients unless CD4+ cell count is <100 cells/microL). Oral products should not be used for HIV infection, adenovirus, RSV, or influenza infections.

Geriatric ConsiderationsNo specific recommendations are necessary in the elderly.
Pregnancy Risk FactorX
Pregnancy Considerations**[U.S. Boxed Warning]: Significant teratogenic effects have been observed in all animal studies** at ~0.01 times the maximum recommended daily human dose. Use is contraindicated in pregnancy. Negative pregnancy test is required before initiation and monthly thereafter. Avoid pregnancy in female patients and female partners of male patients during therapy by using two effective forms of contraception; continue contraceptive measures for at least 6 months after completion of therapy. If patient or female partner becomes pregnant during treatment, she should be counseled about potential risks of exposure. If pregnancy occurs during use or within 6 months after treatment, report to the ribavirin pregnancy registry (800-593-2214).
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

Inhalation:

1% to 10%:

Central nervous system: Fatigue, headache, insomnia

Gastrointestinal: Nausea, anorexia

Hematologic: Anemia

<1%: Hypotension, cardiac arrest, digitalis toxicity, conjunctivitis, mild bronchospasm, worsening of respiratory function, apnea

Note: Incidence of adverse effects (approximate) in healthcare workers: Headache (51%); conjunctivitis (32%); rhinitis, nausea, rash, dizziness, pharyngitis, and lacrimation (10% to 20%); bronchospasm and/or chest pain (case reports in individuals with underlying airway disease)

Oral (all adverse reactions are documented while receiving combination therapy with alfa interferons; percentages as reported in adults); asterisked (*) percentages are those similar to interferon therapy alone:

>10%:

Central nervous system: Fatigue (60% to 70%)*, headache (43% to 66%)*, fever (32% to 46%)*, insomnia (26% to 41%), depression (20% to 36%)*, irritability (23% to 33%), dizziness (14% to 26%), impaired concentration (10% to 21%)*, emotional lability (7% to 12%)*

Dermatologic: Alopecia (27% to 36%), pruritus (13% to 29%), rash (5% to 28%), dry skin (10% to 24%), dermatitis (≤16%)

Endocrine and metabolic: Hyperuricemia (33% to 38%)

Gastrointestinal: Nausea (25% to 47%), anorexia (21% to 32%), weight decrease (10% to 29%), vomiting (9% to 25%)*, diarrhea (10% to 22%), dyspepsia (6% to 16%), abdominal pain (8% to 13%), xerostomia (≤12%), RUQ pain (≤12%)

Hematologic: Leukopenia (6% to 45%), neutropenia (8% to 42%; grade 4: 2% to 11%; 40% with HIV coinfection), hemoglobin decreased (21% to 36%), anemia (11% to 17%), thrombocytopenia (<1% to 15%), lymphopenia (12% to 14%), hemolytic anemia (10% to 13%)

Hepatic: Bilirubin increase (10% to 32%)

Neuromuscular & skeletal: Myalgia (40% to 64%)*, rigors (25% to 48%), arthralgia (22% to 34%)*, musculoskeletal pain (19% to 28%)

Respiratory: Dyspnea (13% to 26%), cough (7% to 23%), pharyngitis (≤13%), sinusitis (≤12%)*

Miscellaneous: Flu-like syndrome (13% to 18%)*, viral infection (≤12%), diaphoresis (≤11%)

1% to 10%:

Cardiovascular: Chest pain (5% to 9%)*, flushing (≤4%)

Central nervous system: Pain (≤10%), mood alteration (≤6%; 9% with HIV coinfection), agitation (5% to 8%), nervousness (6%)*, memory impairment (≤6%), malaise (≤6%), suicidal ideation (adolescents: 2%; adults: 1%)

Dermatologic: Eczema (4% to 5%)

Endocrine & metabolic: Menstrual disorder (≤7%), hypothyroidism (≤5%)

Gastrointestinal: Taste perversion (4% to 9%), constipation (≤5%)

Hepatic: Hepatomegaly (≤4%), transaminases increased (1% to 3%), hepatic decompensation (2% with HIV coinfection)

Neuromuscular & skeletal: Weakness (9% to 10%), back pain (5%)

Ocular: Blurred vision (≤6%), conjunctivitis (≤5%)

Respiratory: Rhinitis (≤8%), exertional dyspnea (≤7%)

Miscellaneous: Fungal infection (≤6%), bacterial infection (3% to 5%)

<1%: Aggression, angina, anxiety, aplastic anemia, arrhythmia; autoimmune disorders (systemic lupus erythematosus, rheumatoid arthritis, sarcoidosis); cerebral hemorrhage, cholangitis, colitis, coma, corneal ulcer, diabetes mellitus, drug abuse relapse/overdose, fatty liver, gastrointestinal bleeding, gout, hallucination, hepatic dysfunction, hyper-/hypothyroidism, myositis, pancreatitis, peptic ulcer, peripheral neuropathy, psychosis, psychotic disorder, pulmonary dysfunction, pulmonary embolism, suicide, thrombotic thrombocytopenic purpura, thyroid function test abnormalities

Postmarketing and/or case reports: Dehydration, dental disorders, exfoliative dermatitis, hearing impairment/ loss, hypersensitivity (including anaphylaxis, angioedema, bronchoconstriction, and urticaria), periodontal disorders, pneumonitis, pulmonary infiltrates, pure red cell aplasia; skin reactions (erythema multiforme, exfoliative dermatitis, urticaria, vesiculobullous eruptions); sarcoidosis exacerbation, Stevens-Johnson syndrome, vertigo

Note: Incidence of anorexia, headache, fever, suicidal ideation, and vomiting are higher in children.

Drug Interactions

Influenza Virus Vaccine: Antiviral Agents (Influenza A and B) may diminish the therapeutic effect of Influenza Virus Vaccine. This only pertains to live, attentuated influenza virus vaccine. *Risk D: Consider therapy modification*

Interferons (Alfa): May enhance the adverse/toxic effect of Ribavirin. Hemolytic anemia has been observed. *Risk C: Monitor therapy*

Reverse Transcriptase Inhibitors (Nucleoside): Ribavirin may enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Oral: High-fat meal increases the AUC and C_{max}.

Monitoring Parameters

Inhalation: Respiratory function, hemoglobin, reticulocyte count, CBC with differential, I & O

Oral: Hemoglobin and hematocrit (pretreatment, 2- and 4 weeks after initiation), CBC with differential; pretreatment and monthly pregnancy test for women of childbearing age; LFTs, renal function, TSH, serum HCV RNA ; pretreatment ECG in patients with pre-existing cardiac disease; dental exams

Reference Range

Early viral response (EVR): >2 log decrease in HCV RNA after 12 weeks of treatment

End of treatment response (ETR): Absence of detectable HCV RNA at end of the recommended treatment period

Sustained treatment response (STR): Absence of HCV RNA in the serum 6 months following completion of full treatment course

Nursing: Physical Assessment/MonitoringNote specific cautions for healthcare professionals' exposure risks with inhalation formulation. Evaluate patient health status and history for contraindications and use cautions prior to beginning therapy. Evaluate results of laboratory tests, therapeutic effectiveness, and adverse reactions (eg, CNS effects [headache, fatigue, irritability, impaired concentration], GI disturbance [nausea, vomiting, anorexia], hematologic [anemia], deterioration of hepatic, respiratory, or cardiac status) on a regular basis with long-term therapy. Teach patient proper use (according to formulation), possible side effects/appropriate interventions, and adverse symptoms to report. Instruct patient to carefully read the FDA-approved medication guide distributed to each patient to whom this medication is dispensed for the treatment of hepatitis C. **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment. Do not give to women of childbearing age or males who may have intercourse with pregnant or childbearing women unless both male and female are capable of complying with using two effective forms of contraception during therapy and 6 months following therapy.

Monitoring: Lab Tests

Inhalation: Respiratory function, CBC with differential

Oral: Hemoglobin and hematocrit (pretreatment, 2- and 4 weeks after initiation), CBC with differential; pretreatment and monthly pregnancy test for women of childbearing age; LFTs, renal function, TSH, serum HCV RNA; pretreatment ECG in patients with pre-existing cardiac disease

Patient EducationFor oral administration, take as directed (capsules, with food; solution, with or without food, but always in a consistent manner in regard to food intake). For aerosol use, follow exact directions for use of aerosol device. Do not allow pregnant women or women of childbearing age to come in any contact with this medication. If prescribed in conjunction with other medications (injections), maintain schedule as directed. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You will need regular blood tests while taking this drug. You may experience increased susceptibility to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause dental or periodontal disorders (brush teeth at least twice daily and have regular dental exams). May cause confusion, insomnia, impaired concentration, emotional lability or headache (use cautions when driving or engaging in potentially hazardous tasks until response to drug is known); nausea, vomiting, or anorexia (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); diarrhea (buttermilk, boiled milk, or yogurt may relieve diarrhea); or loss of hair (reversible). Report chest pain or palpitations; unusual cough or difficulty breathing; rash; signs of infection (fever, chills, unusual bleeding or bruising, infection, or unhealed sores or white plaques in mouth); tingling, weakness, or pain in extremities; CNS changes (suicidal ideation, fatigue, insomnia, irritability, depression, impaired concentration); or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Both males and females should use appropriate barrier contraceptive measures during and for 6 months following end of therapy. Do not allow family members or friends who are pregnant or may become pregnant to handle inhalation powder. This drug may cause serious fetal defects. Consult prescriber for appropriate barrier contraceptive measures if necessary or if you suspect you might be pregnant. Do not donate blood during or for 6 months following therapy. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 200 mg

- Rebetol®, Ribasphere®: 200 mg

Combination package [dose pack]:

- RibaPak™ 400/600 [each package contains]:
  - Tablet: 400 mg (7s)
  - Tablet: 600 mg (2s)

Powder for solution, for nebulization:

- Virazole®: 6 g (1s) [reconstituted product contains ribavirin 20 mg/mL]

Solution, oral:

- Rebetol®: 40 mg/mL (100 mL) [contains propylene glycol and sodium benzoate; bubble-gum flavor]

Tablet: 200 mg

- Copegus®: 200 mg
- Ribasphere®: 200 mg, 400 mg, 600 mg

Tablet [dose pack]:

- RibaPak™: 400 mg (14s); 600 mg (14s)

Generic AvailableYes: Capsule, tablet

Pricing: U.S. (www.drugstore.com)

Capsules (Rebetol)

- 200 mg (60): $553.99

Capsules (Ribasphere)

- 200 mg (30): $280.00

Capsules (Ribavirin)

- 200 mg (56): $260.02

Solution (Rebetol)

- 40 mg/mL (100): $223.97

Mechanism of ActionInhibits replication of RNA and DNA viruses; inhibits influenza virus RNA polymerase activity and inhibits the initiation and elongation of RNA fragments resulting in inhibition of viral protein synthesis

Pharmacodynamics/Kinetics

Absorption: Inhalation: Systemic; dependent upon respiratory factors and method of drug delivery; maximal absorption occurs with the use of aerosol generator via endotracheal tube; highest concentrations in respiratory tract and erythrocytes

Distribution: Oral capsule: Single dose: V_d 2825 L; distribution significantly prolonged in the erythrocyte (16-40 days), which can be used as a marker for intracellular metabolism

Protein binding: Oral: None

Metabolism: Hepatically and intracellularly (forms active metabolites); may be necessary for drug action

Bioavailability: Oral: 64%

Half-life elimination, plasma:

- Children: Inhalation: 6.5-11 hours
- Adults: Oral:
  - Capsule, single dose (Rebetol®, Ribasphere®): 24 hours in healthy adults, 44 hours with chronic hepatitis C infection (increases to ~298 hours at steady state)

Tablet, single dose (Copegus®): ~120-170 hours

Time to peak, serum: Inhalation: At end of inhalation period; Oral capsule: Multiple doses: 3 hours; Tablet: 2 hours

Excretion: Inhalation: Urine (40% as unchanged drug and metabolites); Oral capsule: Urine (61%), feces (12%)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusWhen used in combination with interferon alfa-2A or alfa-2b: Dizziness and drowsiness are common; may rarely cause delirium. Severe psychiatric disorders, including depression and suicidal behavior, have been associated with the use of some interferons. Careful neuropsychiatric monitoring is recommended.

Mental Health: Effects on Psychiatric TreatmentWhen used in combination with interferon alfa-2A or alfa-2b: May cause leukopenia; use caution with clozapine and carbamazepine; concurrent use with psychotropics may produce additive sedation and dry mouth

Index TermsRTCA; Tribavirin

Riboflavin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Riboflavin may be confused with ribavirin

Pronunciation(RYE boe flay vin)
U.S. Brand NamesRibo-100
Pharmacologic Category[Vitamin, Water Soluble]
Use: Labeled IndicationsPrevention of riboflavin deficiency and treatment of ariboflavinosis
Dosing: Adults

Riboflavin deficiency: Oral: 5-30 mg/day in divided doses

Recommended daily allowance: Oral: 1.2-1.7 mg

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Riboflavin deficiency: Oral: Children: 2.5-10 mg/day in divided doses

Recommended daily allowance: Oral: Children: 0.4-1.8 mg

Warnings/Precautions

Other warnings/precautions:

â˘ Vitamin deficiency: Single vitamin deficiency is rare; evaluate for other deficiencies.

Pregnancy Risk FactorA/C (dose exceeding RDA recommendation)
LactationEnters breast milk/compatible
Adverse ReactionsFrequency not defined: Genitourinary: Discoloration of urine (yellow-orange)
Drug InteractionsThere are no known significant interactions.
Test InteractionsLarge doses may interfere with urinalysis based on spectrometry; may cause false elevations in fluorometric determinations of catecholamines and urobilinogen
Monitoring ParametersCBC and reticulocyte counts (if anemic when treating deficiency)
Nursing: Physical Assessment/MonitoringAssess knowledge/teach patient appropriate use, dietary instruction, possible side effects, and adverse symptoms to report.
Patient EducationTake with food. Large doses may cause bright yellow or orange urine.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 25 mg, 50 mg, 100 mg

Ribo-100: 100 mg

Generic AvailableYes
Mechanism of ActionComponent of flavoprotein enzymes that work together, which are necessary for normal tissue respiration; also needed for activation of pyridoxine and conversion of tryptophan to niacin
Pharmacodynamics/Kinetics

Absorption: Readily via GI tract, however, food increases extent; decreased with hepatitis, cirrhosis, or biliary obstruction

Metabolism: None

Half-life elimination: Biologic: 66-84 minutes

Excretion: Urine (9%) as unchanged drug

Pharmacotherapy PearlsDietary sources of riboflavin include liver, kidney, dairy products, green vegetables, eggs, whole grain cereals, yeast, and mushroom.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsLactoflavin; Vitamin B_2; Vitamin G

Rifabutin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Rifabutin may be confused with rifampin

Pronunciation(rif a BYOO tin)

U.S. Brand NamesMycobutin®

Canadian Brand NamesMycobutin®

Pharmacologic CategoryAntibiotic, Miscellaneous; Antitubercular Agent

Use: Labeled IndicationsPrevention of disseminated *Mycobacterium avium* complex (MAC) in patients with advanced HIV infection

Use: Unlabeled/InvestigationalUtilized in multidrug regimens for treatment of MAC

Dosing: Adults

Disseminated MAC in advanced HIV infection:

Prophylaxis: Oral: 300 mg once daily (alone or in combination with azithromycin)

Treatment (unlabeled use): Oral:

Patients not receiving NNRTIs or protease inhibitors:

Initial phase: 5 mg/kg daily (maximum: 300 mg)

Second phase: 5 mg/kg daily or twice weekly

Dosage adjustment for concurrent nelfinavir, amprenavir, indinavir: Reduce rifabutin dose to 150 mg/day; no change in dose if administered twice weekly

Dosage adjustment for concurrent efavirenz (no concomitant protease inhibitor): Increase rifabutin dose to 450-600 mg daily, or 600 mg 3 times/week

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Disseminated MAC in advanced HIV infection: Children >1 year:

Prophylaxis: Oral: 5 mg/kg daily; higher dosages have been used in limited trials

Treatment (unlabeled use): Oral: Patients not receiving NNRTIs or protease inhibitors:

Initial phase (2 weeks to 2 months): 10-20 mg/kg daily (maximum: 300 mg).

Second phase: 10-20 mg/kg daily (maximum: 300 mg) or twice weekly

Dosing: Renal ImpairmentCl$_{cr}$ <30 mL/minute: Reduce dose by 50%

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralShould be administered on an empty stomach, but may be taken with meals to minimize nausea or vomiting.

Dietary ConsiderationsMay be taken with meals or without food or mix with applesauce.

ContraindicationsHypersensitivity to rifabutin, any other rifamycins, or any component of the formulation; rifabutin is contraindicated in patients with a WBC <1000/mm^3 or a platelet count <50,000/mm^3

Allergy Considerations

- Rifamycin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with liver impairment; discontinue in patients with AST >500 units/L or if total bilirubin is >3 mg/dL.

- Renal impairment: Use with caution in patients with renal impairment; modification of dosage should be considered.
- Tuberculosis: Appropriate use: As a single agent must not be administered to patients with active tuberculosis since its use may lead to the development of tuberculosis that is resistant to both rifabutin and rifampin.

Geriatric ConsiderationsNo specific recommendations for the elderly.
Pregnancy Risk FactorB
LactationExcretion in breast milk unknown
Adverse Reactions

>10%:

Dermatologic: Rash (11%)

Genitourinary: Discoloration of urine (30%)

Hematologic: Neutropenia (25%), leukopenia (17%)

1% to 10%:

Central nervous system: Headache (3%)

Gastrointestinal: Abdominal pain (4%), vomiting/nausea (3%), diarrhea (3%), eructation (3%), anorexia (2%), flatulence (2%)

Hematologic: Anemia, thrombocytopenia (5%)

Hepatic: ALT increased (7% to 9%), AST increased (7% to 9%)

Neuromuscular & skeletal: Myalgia

<1%: Chest pain, dyspepsia, dyspnea, fever, insomnia, taste perversion, uveitis

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Induces** CYP3A4 (strong)
Drug Interactions

Alfentanil: Rifamycin Derivatives may increase the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Amiodarone: Rifamycin Derivatives may increase the metabolism of Amiodarone. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Rifamycin Derivatives may increase the metabolism of Angiotensin II Receptor Blockers. **Exceptions:** Candesartan; Eprosartan; Olmesartan; Telmisartan; Valsartan. *Risk C: Monitor therapy*

Antiemetics (5HT3 Antagonists): Rifamycin Derivatives may increase the metabolism of Antiemetics (5HT3 Antagonists). **Exceptions:** Dolasetron; Granisetron; Palonosetron. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Rifamycin Derivatives. Only rifabutin appears to be affected. Rifamycin Derivatives may decrease the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Aprepitant: Rifamycin Derivatives may increase the metabolism of Aprepitant. *Risk C: Monitor therapy*

Atovaquone: Rifamycin Derivatives may decrease the serum concentration of Atovaquone. *Risk D: Consider therapy modification*

Barbiturates: Rifamycin Derivatives may increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Rifamycin Derivatives may increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

BusPIRone: Rifamycin Derivatives may increase the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Rifamycin Derivatives may increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Clopidogrel: Rifamycin Derivatives may enhance the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Contraceptive (Progestins): Rifamycin Derivatives may decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Rifamycin Derivatives may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Rifamycin Derivatives may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dapsone: Rifamycin Derivatives may increase the metabolism of Dapsone. *Risk D: Consider therapy modification*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Delavirdine: May decrease the metabolism of Rifamycin Derivatives. Rifamycin Derivatives may increase the metabolism of Delavirdine. *Risk D:*

Consider therapy modification

Disopyramide: Rifamycin Derivatives may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Efavirenz: May decrease the serum concentration of Rifabutin. Rifabutin may decrease the serum concentration of Efavirenz. Management: If efavirenz is to be used with daily rifabutin, increase the planned rifabutin dose by 50%. If used with regimens where rifabutin is administered 2-3 times per week, consider doubling the rifabutin dose. *Risk D: Consider therapy modification*

Etravirine: Rifabutin may decrease the serum concentration of Etravirine. Management: Avoid concomitant use with rifabutin if a protease inhibitor/ritonavir combination is also used. *Risk C: Monitor therapy*

FentaNYL: Rifamycin Derivatives may decrease the serum concentration of FentaNYL. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Rifamycin Derivatives. This appears only affect rifabutin. Rifamycin Derivatives may increase the metabolism of Fluconazole. *Risk C: Monitor therapy*

Gefitinib: Rifamycin Derivatives may increase the metabolism of Gefitinib. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Rifamycin Derivatives may increase the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Rosuvastatin. *Risk D: Consider therapy modification*

Imatinib: Rifamycin Derivatives may increase the metabolism of Imatinib. *Risk D: Consider therapy modification*

Isoniazid: Rifamycin Derivatives may enhance the hepatotoxic effect of Isoniazid. Even so, this is a frequently employed combination regimen. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Rifamycin Derivatives. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Morphine Sulfate: Rifamycin Derivatives may decrease the serum concentration of Morphine Sulfate. *Risk C: Monitor therapy*

Mycophenolate: Rifamycin Derivatives may decrease the serum concentration of Mycophenolate. Specifically, rifamycin derivatives may decrease the concentration of the active metabolite mycophenolic acid. *Risk X: Avoid combination*

Nevirapine: Rifabutin may decrease the serum concentration of Nevirapine. Nevirapine may decrease the serum concentration of Rifabutin. Nevirapine may increase the serum concentration of Rifabutin. *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): Rifamycin Derivatives may decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: Rifamycin Derivatives may increase the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Propafenone: Rifamycin Derivatives may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the metabolism of Rifamycin Derivatives. Specifically rifabutin. Rifamycin Derivatives may decrease the serum concentration of Protease Inhibitors. Rifampin administration should be avoided. Dosage adjustments with both rifabutin and the protease inhibitors are necessary if used together. Management: Avoid using rifampin with protease inhibitors. Rifabutin and protease inhibitor dose adjustments will likely be required when using rifabutin together with protease inhibitors; consult specific protease inhibitor(s) prescribing information. *Risk D: Consider therapy modification*

QuiNIDine: Rifamycin Derivatives may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Ramelteon: Rifamycin Derivatives may increase the metabolism of Ramelteon. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Repaglinide: Rifamycin Derivatives may increase the metabolism of Repaglinide. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Sunitinib: Rifamycin Derivatives may increase the metabolism of Sunitinib. *Risk D: Consider therapy modification*

Tacrolimus: Rifamycin Derivatives may increase the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Tamoxifen: Rifamycin Derivatives may increase the metabolism of Tamoxifen. *Risk C: Monitor therapy*

Temsirolimus: Rifamycin Derivatives may decrease the serum concentration of Temsirolimus. Rifamycins will likely cause an even greater decrease in the concentration of the active metabolite sirolimus. Management: Temsirolimus prescribing information recommends against coadministration with strong CYP3A4 inducers such as rifampin; however, if concurrent therapy is necessary, an increase in temsirolimus dose to 50 mg/week should be considered. *Risk D: Consider therapy modification*

Terbinafine: Rifamycin Derivatives may increase the metabolism of Terbinafine. *Risk D: Consider therapy modification*

Tocainide: Rifamycin Derivatives may increase the metabolism of Tocainide. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Rifamycin Derivatives may increase the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Voriconazole: May increase the serum concentration of Rifamycin Derivatives. Rifamycin Derivatives may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Zaleplon: Rifamycin Derivatives may increase the metabolism of Zaleplon. *Risk C: Monitor therapy*

Zolpidem: Rifamycin Derivatives may increase the metabolism of Zolpidem. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: High-fat meal may decrease the rate but not the extent of absorption.
Monitoring ParametersPeriodic liver function tests, CBC with differential, platelet count
Nursing: Physical Assessment/MonitoringNot for use in patients with active tuberculosis. Assess potential for interactions with other pharmacological agents patient may be taking (eg, decreased levels/effects of multiple other agents). Caution females using hormone contraceptive about potential for decreased contraceptive effects. Evaluate results of laboratory tests, therapeutic effectiveness (prevention of MAC in patients with HIV), and adverse response (eg, anemia, neutropenia, GI disturbance). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsPeriodic liver function, CBC with differential, platelet count
Patient EducationDo not take any new medication during therapy without consulting prescriber. Take as directed, with or without food. Complete full course of therapy; do not skip doses. Will discolor urine, stool, saliva, tears, sweat, and other body fluid a red-brown color. Stains on clothing or contact lenses are permanent. Report skin rash; persistent vomiting or diarrhea; fever, chills, or flu-like symptoms; dark urine or pale stools; unusual bleeding or bruising; or unusual confusion, depression, or fatigue. **Breast-feeding precaution:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 150 mg

Generic AvailableNo
ManufacturerPharmacia & Upjohn
Pricing: U.S. (www.drugstore.com)

Capsules (Mycobutin)

150 mg (100): $971.61

Mechanism of ActionInhibits DNA-dependent RNA polymerase at the beta subunit which prevents chain initiation
Pharmacodynamics/Kinetics

Absorption: Readily, 53%

Distribution: V_d: 9.32 L/kg; distributes to body tissues including the lungs, liver, spleen, eyes, and kidneys

Protein binding: 85%

Metabolism: To active and inactive metabolites

Bioavailability: Absolute: HIV: 20%

Half-life elimination: Terminal: 45 hours (range: 16-69 hours)

Time to peak, serum: 2-4 hours

Excretion: Urine (10% as unchanged drug, 53% as metabolites); feces (10% as unchanged drug, 30% as metabolites)

Medication Safety Issues

Sound-alike/look-alike issues:

Rifamate® may be confused with rifampin

Pronunciation(rif AM pin & eye soe NYE a zid)
U.S. Brand NamesIsonaRif™; Rifamate®
Canadian Brand NamesRifamate®
Pharmacologic CategoryAntibiotic, Miscellaneous
Use: Labeled IndicationsManagement of active tuberculosis; see individual agents for additional information
Dosing: Adults**Tuberculosis:** Oral: 2 capsules/day
Dosing: ElderlyRefer to dosing in individual monographs.
Allergy Considerations

- Isoniazid Allergy
- Rifamycin Allergy

Warnings/PrecautionsSee individual agents.
Pregnancy Risk FactorC
Pregnancy ConsiderationsRefer to Rifampin monograph.
LactationEnters breast milk/compatible
Metabolism/Transport Effects

Rifampin: **Induces** CYP1A2 (strong), 2A6 (strong), 2B6 (strong), 2C8 (strong), 2C9 (strong), 2C19 (strong), 3A4 (strong)

Isoniazid: **Substrate** of CYP2E1 (major); **Inhibits** CYP1A2 (weak), 2A6 (moderate), 2C9 (weak), 2C19 (strong), 2D6 (moderate), 2E1 (moderate), 3A4 (strong); **Induces** CYP2E1 (after discontinuation) (weak)

Drug Interactions

Acetaminophen: Isoniazid may enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

Alfentanil: Rifamycin Derivatives may increase the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Amiodarone: Rifamycin Derivatives may increase the metabolism of Amiodarone. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Rifamycin Derivatives may increase the metabolism of Angiotensin II Receptor Blockers. **Exceptions:** Candesartan; Eprosartan; Olmesartan; Telmisartan; Valsartan. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Isoniazid. *Risk D: Consider therapy modification*

Antidiabetic Agents (Thiazolidinedione): Rifampin may increase the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Antiemetics (5HT3 Antagonists): Rifamycin Derivatives may increase the metabolism of Antiemetics (5HT3 Antagonists). **Exceptions:** Dolasetron; Granisetron; Palonosetron. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Rifamycin Derivatives. Only rifabutin appears to be affected. Rifamycin Derivatives may decrease the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Aprepitant: Rifamycin Derivatives may increase the metabolism of Aprepitant. *Risk C: Monitor therapy*

Atazanavir: Rifampin may decrease the serum concentration of Atazanavir. *Risk X: Avoid combination*

Atovaquone: Rifamycin Derivatives may decrease the serum concentration of Atovaquone. *Risk D: Consider therapy modification*

Barbiturates: Rifamycin Derivatives may increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Bendamustine: CYP1A2 Inducers (Strong) may decrease the serum concentration of Bendamustine. Concentrations of active metabolites may be increased. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Rifamycin Derivatives may increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Isoniazid may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Beta-Blockers: Rifamycin Derivatives may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Carteolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

BusPIRone: Rifamycin Derivatives may increase the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Rifamycin Derivatives may increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CarBAMazepine: Isoniazid may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Caspofungin: Rifampin may decrease the serum concentration of Caspofungin. Management: Caspofungin prescribing information recommends using a dose of 70mg daily in adults (or 70mg/m^2, up to a maximum of 70mg, daily in pediatric patients) who are also receiving rifampin. *Risk D: Consider therapy modification*

Caspofungin: Inducers of Drug Clearance may decrease the serum concentration of Caspofungin. Management: Consider using an increased caspofungin dose of 70mg daily in adults (or 70mg/m^2, up to a maximum of 70mg, daily in pediatric patients) when coadministered with known inducers of drug clearance. *Risk D: Consider therapy modification*

Chloramphenicol: Rifampin may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

Chlorzoxazone: Isoniazid may decrease the metabolism of Chlorzoxazone. *Risk C: Monitor therapy*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Clopidogrel: Rifamycin Derivatives may enhance the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

Contraceptive (Progestins): Rifamycin Derivatives may decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Rifamycin Derivatives may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticosteroids (Systemic): May decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

CycloSERINE: May enhance the CNS depressant effect of Isoniazid. *Risk D: Consider therapy modification*

CycloSPORINE: Rifamycin Derivatives may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP1A2 Substrates: CYP1A2 Inducers (Strong) may increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP2A6 Substrates: CYP2A6 Inducers (Strong) may increase the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP2A6 Substrates: CYP2A6 Inhibitors (Moderate) may decrease the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Substrates: CYP2B6 Inducers (Strong) may increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Strong) may decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2C19 Substrates: CYP2C19 Inducers (Strong) may increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inducers (Highly Effective) may increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inducers (Highly Effective) may increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP2E1 Substrates: CYP2E1 Inhibitors (Moderate) may decrease the metabolism of CYP2E1 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inducers may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dapsone: Rifamycin Derivatives may increase the metabolism of Dapsone. *Risk D: Consider therapy modification*

Delavirdine: May decrease the metabolism of Rifamycin Derivatives. Rifamycin Derivatives may increase the metabolism of Delavirdine. *Risk D: Consider therapy modification*

Disopyramide: Rifamycin Derivatives may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Efavirenz: Rifampin may decrease the serum concentration of Efavirenz. Management: Efavirenz dose adjustment (to 800mg daily) may be required, particularly for patients weighing more than 60kg. *Risk C: Monitor therapy*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

Erlotinib: Rifampin may increase the metabolism of Erlotinib. *Risk D: Consider therapy modification*

Etravirine: Rifamycin Derivatives may decrease the serum concentration of Etravirine. *Risk X: Avoid combination*

Exemestane: Rifampin may increase the metabolism of Exemestane. *Risk D: Consider therapy modification*

FentaNYL: Rifamycin Derivatives may decrease the serum concentration of FentaNYL. *Risk C: Monitor therapy*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Fexofenadine: Rifampin may decrease the serum concentration of Fexofenadine. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Rifamycin Derivatives. This appears only affect rifabutin. Rifamycin Derivatives may increase the metabolism of Fluconazole. *Risk C: Monitor therapy*

Fosaprepitant: Rifampin may decrease the serum concentration of Fosaprepitant. More specifically, rifampin may decrease concentrations of the active metabolite aprepitant. *Risk C: Monitor therapy*

Gefitinib: Rifamycin Derivatives may increase the metabolism of Gefitinib. *Risk D: Consider therapy modification*

HMG-CoA Reductase Inhibitors: Rifamycin Derivatives may increase the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Rosuvastatin. *Risk D: Consider therapy modification*

Imatinib: Rifamycin Derivatives may increase the metabolism of Imatinib. *Risk D: Consider therapy modification*

Isoniazid: Rifamycin Derivatives may enhance the hepatotoxic effect of Isoniazid. Even so, this is a frequently employed combination regimen. *Risk C: Monitor therapy*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

LamoTRIgine: Rifampin may increase the metabolism of LamoTRIgine. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Rifamycin Derivatives. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methadone: Rifamycin Derivatives may increase the metabolism of Methadone. *Risk C: Monitor therapy*

Morphine Sulfate: Rifamycin Derivatives may decrease the serum concentration of Morphine Sulfate. *Risk C: Monitor therapy*

Mycophenolate: Rifamycin Derivatives may decrease the serum concentration of Mycophenolate. Specifically, rifamycin derivatives may decrease the concentration of the active metabolite mycophenolic acid. *Risk X: Avoid combination*

Nevirapine: Rifampin may decrease the serum concentration of Nevirapine. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): Rifamycin Derivatives may decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inducers may decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: Isoniazid may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Phenytoin: Rifamycin Derivatives may increase the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Praziquantel: Rifampin may decrease the serum concentration of Praziquantel. *Risk X: Avoid combination*

Propafenone: Rifamycin Derivatives may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the metabolism of Rifamycin Derivatives. Specifically rifabutin. Rifamycin Derivatives may decrease the serum concentration of Protease Inhibitors. Rifampin administration should be avoided. Dosage adjustments with both rifabutin and the protease inhibitors are necessary if used together. Management: Avoid using rifampin with protease inhibitors. Rifabutin and protease inhibitor dose adjustments will likely be required when using rifabutin together with protease inhibitors; consult specific protease inhibitor(s) prescribing information. *Risk D: Consider therapy modification*

Pyrazinamide: May enhance the hepatotoxic effect of Rifampin. Severe (even fatal) liver injury has been reported in patients receiving these 2 drugs as a 2-month treatment regimen for latent TB infection. *Risk D: Consider therapy modification*

QuiNIDine: Rifamycin Derivatives may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Raltegravir: Rifampin may decrease the serum concentration of Raltegravir. *Risk C: Monitor therapy*

Ramelteon: Rifamycin Derivatives may increase the metabolism of Ramelteon. *Risk C: Monitor therapy*

Ranolazine: Rifampin may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Repaglinide: Rifamycin Derivatives may increase the metabolism of Repaglinide. *Risk C: Monitor therapy*

Rifamycin Derivatives: May enhance the hepatotoxic effect of Isoniazid. Even so, this is a frequently employed combination regimen. *Risk C: Monitor therapy*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sirolimus: Rifampin may increase the metabolism of Sirolimus. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Sulfonylureas: Rifampin may increase the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Sunitinib: Rifamycin Derivatives may increase the metabolism of Sunitinib. *Risk D: Consider therapy modification*

Tacrolimus: Rifamycin Derivatives may increase the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Tamoxifen: Rifamycin Derivatives may increase the metabolism of Tamoxifen. *Risk C: Monitor therapy*

Temsirolimus: Rifamycin Derivatives may decrease the serum concentration of Temsirolimus. Rifamycins will likely cause an even greater decrease in the concentration of the active metabolite sirolimus. Management: Temsirolimus prescribing information recommends against coadministration with strong CYP3A4 inducers such as rifampin; however, if concurrent therapy is necessary, an increase in temsirolimus dose to 50 mg/week should be considered. *Risk D: Consider therapy modification*

Terbinafine: Rifamycin Derivatives may increase the metabolism of Terbinafine. *Risk D: Consider therapy modification*

Theophylline Derivatives: Isoniazid may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Thyroid Products: Rifampin may decrease the serum concentration of Thyroid Products. *Risk C: Monitor therapy*

Tocainide: Rifamycin Derivatives may increase the metabolism of Tocainide. *Risk C: Monitor therapy*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Valproic Acid: Rifampin may decrease the serum concentration of Valproic Acid. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Rifamycin Derivatives may increase the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Voriconazole: May increase the serum concentration of Rifamycin Derivatives. Rifamycin Derivatives may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Zaleplon: Rifamycin Derivatives may increase the metabolism of Zaleplon. *Risk C: Monitor therapy*

Zidovudine: Rifamycin Derivatives may increase the metabolism of Zidovudine. *Risk D: Consider therapy modification*

Zolpidem: Rifamycin Derivatives may increase the metabolism of Zolpidem. *Risk C: Monitor therapy*

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusRifampin may cause drowsiness, dizziness, confusion, behavioral changes, or ataxia; report of cognitive disturbances, delusions, and hallucinations; isoniazid may cause drowsiness or dizziness; may rarely cause depression or psychosis; reports of insomnia, restlessness, disorientation, hallucinations, delusions, obsessive-compulsive symptoms, and exacerbation of schizophrenia

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; rifampin is a potent hepatic enzyme inducer; monitor for altered clinical effects when used concurrently with psychotropics; isoniazid may impair the metabolism of carbamazepine and oxidatively metabolized benzodiazepines; monitor for adverse effects

Index TermsIsoniazid and Rifampin

International Brand NamesBifix (PH); Dipicin-INH (PH); R-Cinex 600 (IN); Ramicin-ISO (ID, PH); Refinah 300 (MY, PH, TH); Rifaina (TW); Rifazida (AE, BH, CY, EG, IL, IQ, IR, JO, KW, LB, LY, OM, QA, SA, SY, YE); Rifinah (AE, AR, BF, BH, BJ, CI, CY, DE, EG, ET, FR, GB, GH, GM, GN, GR, HK, IL, IQ, IR, JO, KE, KW, LB, LR, LY, MA, ML, MR, MU, MW, MX, NE, NG, NZ, OM, PK, QA, SA, SC, SD, SL, SN, SY, TN, TZ, UG, YE, ZA, ZM, ZW); Rifinah 300 (MY, TW); Rifoldin 300MG + INH (AT); Rifzin (PH); Rimactazid (BB, BF, BJ, BM, BS, BZ, CH, CI, ET, GH, GM, GN, GR, GY, JM, KE, LR, MA, ML, MR, MU, MW, NE, NG, NL, PE, PR, SC, SD, SE, SL, SN, SR, TN, TT, TZ, UG, ZA, ZM, ZW); Rimactazid 300 (PH); Rimpazid 450 (BF, BJ, CI, ET, GH, GM, GN, KE, LR, MA, ML, MR, MU, MW, NE, NG, SC, SD, SL, SN, TN, TZ, UG, ZA, ZM, ZW); Rina (TW)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Rifater® may be confused with Rifadin®

Pronunciation(rif AM pin, eye soe NYE a zid, & peer a ZIN a mide)

U.S. Brand NamesRifater®

Canadian Brand NamesRifater®

Pharmacologic CategoryAntibiotic, Miscellaneous

Use: Labeled IndicationsInitial phase, short-course treatment of pulmonary tuberculosis; see individual agents for additional information

Dosing: Adults**Tuberculosis:** Oral: Patients weighing:

≤44 kg: 4 tablets

45-54 kg: 5 tablets

≥55 kg: 6 tablets

Doses should be administered in a single daily dose.

Dosing: ElderlyRefer to dosing in individual monographs.

Dietary ConsiderationsAdminister dose either 1 hour before or 2 hours after a meal with a full glass of water.

Contraindications

Hypersensitivity to rifampin, isoniazid, pyrazinamide, or any component of the formulation; acute or chronic liver disease; gout; concurrent use with amprenavir or saquinavir/ritonavir (and possibly other protease inhibitors); severe fever, chills, or arthritis

Allergy Considerations

- Isoniazid Allergy
- Rifamycin Allergy

Warnings/Precautions

Boxed warnings:

- Hepatitis: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Flu-like syndrome: Regimens of rifampin >600 mg once or twice weekly have been associated with a high incidence of adverse reactions including a flu-like syndrome.

- Hepatitis: **[U.S. Boxed Warning]: Severe and sometimes fatal hepatitis may occur or develop even after many months of treatment with isoniazid.** Patients must report any prodromal symptoms of hepatitis, such as fatigue, weakness, malaise, anorexia, nausea, or vomiting. Baseline serum uric acid and LFTs are recommended; monitor for hyperbilirubinemia and discontinue therapy if this occurs in conjunction with clinical symptoms or any signs of significant hepatocellular damage.

- Hypersensitivity: Hypersensitivity reactions have occurred in patients taking >600 mg of rifampin once or twice weekly.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

- Thrombocytopenia: May cause thrombocytopenia; monitor closely.

Disease-related concerns:

- Alcoholism: Use with caution in patients with a history of alcoholism (even if ethanol consumption is discontinued during therapy).

- Diabetes: Use with caution in patients with diabetes mellitus.

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage reduction may be necessary. Rifampin, isoniazid, and pyrazinamide can each cause liver impairment.

- Meningococcal disease: Do not use for meningococcal disease, only for short-term treatment of asymptomatic carrier states.

- Porphyria: Use with caution in patients with porphyria; exacerbations have been reported.

- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Medications associated with hepatotoxicity: Use with caution in patients receiving concurrent medications associated with hepatotoxicity.

- Pyridoxine: Malnourished patients or individuals likely to develop peripheral neuropathies should receive concomitant pyridoxine therapy (10-50 mg/day).

Special populations:

- Pediatrics: Fixed combination product should not be used in children <15 years of age.

Other warnings/precautions:

- Compliance: Monitor for compliance.

- Ophthalmic examinations: Periodic ophthalmic examinations are recommended even when usual symptoms do not occur.

- Red/orange discoloration: Urine, feces, saliva, sweat, tears, and CSF may be discolored to red/orange.

Pregnancy Risk FactorC
Pregnancy ConsiderationsSee individual agents.
LactationEnters breast milk/use caution
Adverse ReactionsNote: During clinical trial evaluation, the frequency of cardiorespiratory events (eg, chest pain, hemoptysis, palpitation, chest tightness, and pneumothorax) was higher with the combination product (7%) that that reported with individual agents (2%). Also see individual agents.
Metabolism/Transport Effects

Rifampin: **Induces** CYP1A2 (strong), 2A6 (strong), 2B6 (strong), 2C8 (strong), 2C9 (strong), 2C19 (strong), 3A4 (strong)

Isoniazid: **Substrate** of CYP2E1 (major); **Inhibits** CYP1A2 (weak), 2A6 (moderate), 2C9 (weak), 2C19 (strong), 2D6 (moderate), 2E1 (moderate), 3A4 (strong); CYP2E1 (after discontinuation) (weak)

Drug Interactions

Acetaminophen: Isoniazid may enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

Alfentanil: Rifamycin Derivatives may increase the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Amiodarone: Rifamycin Derivatives may increase the metabolism of Amiodarone. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Rifamycin Derivatives may increase the metabolism of Angiotensin II Receptor Blockers. **Exceptions:** Candesartan; Eprosartan; Olmesartan; Telmisartan; Valsartan. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Isoniazid. *Risk D: Consider therapy modification*

Antidiabetic Agents (Thiazolidinedione): Rifampin may increase the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Antiemetics (5HT3 Antagonists): Rifamycin Derivatives may increase the metabolism of Antiemetics (5HT3 Antagonists). **Exceptions:** Dolasetron; Granisetron; Palonosetron. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Rifamycin Derivatives. Only rifabutin appears to be affected. Rifamycin Derivatives may decrease the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Aprepitant: Rifamycin Derivatives may increase the metabolism of Aprepitant. *Risk C: Monitor therapy*

Atazanavir: Rifampin may decrease the serum concentration of Atazanavir. *Risk X: Avoid combination*

Atovaquone: Rifamycin Derivatives may decrease the serum concentration of Atovaquone. *Risk D: Consider therapy modification*

Barbiturates: Rifamycin Derivatives may increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Bendamustine: CYP1A2 Inducers (Strong) may decrease the serum concentration of Bendamustine. Concentrations of active metabolites may be increased. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Rifamycin Derivatives may increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Isoniazid may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Beta-Blockers: Rifamycin Derivatives may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Carteolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

BusPIRone: Rifamycin Derivatives may increase the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Rifamycin Derivatives may increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CarBAMazepine: Isoniazid may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Caspofungin: Rifampin may decrease the serum concentration of Caspofungin. Management: Caspofungin prescribing information recommends using a dose of 70mg daily in adults (or 70mg/m^2, up to a maximum of 70mg, daily in pediatric patients) who are also receiving rifampin. *Risk D: Consider therapy modification*

Caspofungin: Inducers of Drug Clearance may decrease the serum concentration of Caspofungin. Management: Consider using an increased caspofungin dose of 70mg daily in adults (or 70mg/m^2, up to a maximum of 70mg, daily in pediatric patients) when coadministered with known inducers of drug clearance. *Risk D: Consider therapy modification*

Chloramphenicol: Rifampin may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

Chlorzoxazone: Isoniazid may decrease the metabolism of Chlorzoxazone. *Risk C: Monitor therapy*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Clopidogrel: Rifamycin Derivatives may enhance the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

Contraceptive (Progestins): Rifamycin Derivatives may decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Rifamycin Derivatives may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticosteroids (Systemic): May decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

CycloSERINE: May enhance the CNS depressant effect of Isoniazid. *Risk D: Consider therapy modification*

CycloSPORINE: Rifamycin Derivatives may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CycloSPORINE: Pyrazinamide may decrease the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inducers (Strong) may increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP2A6 Substrates: CYP2A6 Inducers (Strong) may increase the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP2A6 Substrates: CYP2A6 Inhibitors (Moderate) may decrease the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Substrates: CYP2B6 Inducers (Strong) may increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Strong) may decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2C19 Substrates: CYP2C19 Inducers (Strong) may increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inducers (Highly Effective) may increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inducers (Highly Effective) may increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP2E1 Substrates: CYP2E1 Inhibitors (Moderate) may decrease the metabolism of CYP2E1 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inducers may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dapsone: Rifamycin Derivatives may increase the metabolism of Dapsone. *Risk D: Consider therapy modification*

Delavirdine: May decrease the metabolism of Rifamycin Derivatives. Rifamycin Derivatives may increase the metabolism of Delavirdine. *Risk D: Consider therapy modification*

Disopyramide: Rifamycin Derivatives may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Efavirenz: Rifampin may decrease the serum concentration of Efavirenz. Management: Efavirenz dose adjustment (to 800mg daily) may be required, particularly for patients weighing more than 60kg. *Risk C: Monitor therapy*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

Erlotinib: Rifampin may increase the metabolism of Erlotinib. *Risk D: Consider therapy modification*

Etravirine: Rifamycin Derivatives may decrease the serum concentration of Etravirine. *Risk X: Avoid combination*

Exemestane: Rifampin may increase the metabolism of Exemestane. *Risk D: Consider therapy modification*

FentaNYL: Rifamycin Derivatives may decrease the serum concentration of FentaNYL. *Risk C: Monitor therapy*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Fexofenadine: Rifampin may decrease the serum concentration of Fexofenadine. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Rifamycin Derivatives. This appears only affect rifabutin. Rifamycin Derivatives may increase the metabolism of Fluconazole. *Risk C: Monitor therapy*

Fosaprepitant: Rifampin may decrease the serum concentration of Fosaprepitant. More specifically, rifampin may decrease concentrations of the active metabolite aprepitant. *Risk C: Monitor therapy*

Gefitinib: Rifamycin Derivatives may increase the metabolism of Gefitinib. *Risk D: Consider therapy modification*

HMG-CoA Reductase Inhibitors: Rifamycin Derivatives may increase the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Rosuvastatin. *Risk D: Consider therapy modification*

Imatinib: Rifamycin Derivatives may increase the metabolism of Imatinib. *Risk D: Consider therapy modification*

Isoniazid: Rifamycin Derivatives may enhance the hepatotoxic effect of Isoniazid. Even so, this is a frequently employed combination regimen. *Risk C: Monitor therapy*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

LamoTRIgine: Rifampin may increase the metabolism of LamoTRIgine. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Rifamycin Derivatives. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methadone: Rifamycin Derivatives may increase the metabolism of Methadone. *Risk C: Monitor therapy*

Morphine Sulfate: Rifamycin Derivatives may decrease the serum concentration of Morphine Sulfate. *Risk C: Monitor therapy*

Mycophenolate: Rifamycin Derivatives may decrease the serum concentration of Mycophenolate. Specifically, rifamycin derivatives may decrease the concentration of the active metabolite mycophenolic acid. *Risk X: Avoid combination*

Nevirapine: Rifampin may decrease the serum concentration of Nevirapine. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): Rifamycin Derivatives may decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inducers may decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: Isoniazid may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Phenytoin: Rifamycin Derivatives may increase the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Praziquantel: Rifampin may decrease the serum concentration of Praziquantel. *Risk X: Avoid combination*

Propafenone: Rifamycin Derivatives may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the metabolism of Rifamycin Derivatives. Specifically rifabutin. Rifamycin Derivatives may decrease the serum concentration of Protease Inhibitors. Rifampin administration should be avoided. Dosage adjustments with both rifabutin and the protease inhibitors are necessary if used together. Management: Avoid using rifampin with protease inhibitors. Rifabutin and protease inhibitor dose adjustments will likely be required when using rifabutin together with protease inhibitors; consult specific protease inhibitor(s) prescribing information. *Risk D: Consider therapy modification*

Pyrazinamide: May enhance the hepatotoxic effect of Rifampin. Severe (even fatal) liver injury has been reported in patients receiving these 2 drugs as a 2-month treatment regimen for latent TB infection. *Risk D: Consider therapy modification*

QuiNIDine: Rifamycin Derivatives may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Raltegravir: Rifampin may decrease the serum concentration of Raltegravir. *Risk C: Monitor therapy*

Ramelteon: Rifamycin Derivatives may increase the metabolism of Ramelteon. *Risk C: Monitor therapy*

Ranolazine: Rifampin may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Repaglinide: Rifamycin Derivatives may increase the metabolism of Repaglinide. *Risk C: Monitor therapy*

Rifampin: Pyrazinamide may enhance the hepatotoxic effect of Rifampin. Severe (even fatal) liver injury has been reported in patients receiving these 2 drugs as a 2-month treatment regimen for latent TB infection. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May enhance the hepatotoxic effect of Isoniazid. Even so, this is a frequently employed combination regimen. *Risk C: Monitor therapy*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sirolimus: Rifampin may increase the metabolism of Sirolimus. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Sulfonylureas: Rifampin may increase the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Sunitinib: Rifamycin Derivatives may increase the metabolism of Sunitinib. *Risk D: Consider therapy modification*

Tacrolimus: Rifamycin Derivatives may increase the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Tamoxifen: Rifamycin Derivatives may increase the metabolism of Tamoxifen. *Risk C: Monitor therapy*

Temsirolimus: Rifamycin Derivatives may decrease the serum concentration of Temsirolimus. Rifamycins will likely cause an even greater decrease in the concentration of the active metabolite sirolimus. Management: Temsirolimus prescribing information recommends against coadministration with strong CYP3A4 inducers such as rifampin; however, if concurrent therapy is necessary, an increase in temsirolimus dose to 50 mg/week should be considered. *Risk D: Consider therapy modification*

Terbinafine: Rifamycin Derivatives may increase the metabolism of Terbinafine. *Risk D: Consider therapy modification*

Theophylline Derivatives: Isoniazid may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Thyroid Products: Rifampin may decrease the serum concentration of Thyroid Products. *Risk C: Monitor therapy*

Tocainide: Rifamycin Derivatives may increase the metabolism of Tocainide. *Risk C: Monitor therapy*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Valproic Acid: Rifampin may decrease the serum concentration of Valproic Acid. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Rifamycin Derivatives may increase the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Voriconazole: May increase the serum concentration of Rifamycin Derivatives. Rifamycin Derivatives may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Zaleplon: Rifamycin Derivatives may increase the metabolism of Zaleplon. *Risk C: Monitor therapy*

Zidovudine: Rifamycin Derivatives may increase the metabolism of Zidovudine. *Risk D: Consider therapy modification*

Zolpidem: Rifamycin Derivatives may increase the metabolism of Zolpidem. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Related Information

- Isoniazid
- Pyrazinamide
- Rifampin

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusRifampin may cause drowsiness, dizziness, confusion, behavioral changes, or ataxia; report of cognitive disturbances, delusions, and hallucinations; isoniazid may cause drowsiness or dizziness; may rarely cause depression or psychosis; reports of insomnia, restlessness, disorientation, hallucinations, delusions, obsessive-compulsive symptoms, and exacerbation of schizophrenia

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; rifampin is a potent hepatic enzyme inducer; monitor for altered clinical effects when used concurrently with psychotropics; isoniazid may impair the metabolism of carbamazepine and oxidatively metabolized benzodiazepines; monitor for adverse effects

Index TermsIsoniazid, Rifampin, and Pyrazinamide; Pyrazinamide, Rifampin, and Isoniazid

Medication Safety Issues

Sound-alike/look-alike issues:

Rifadin® may be confused with Rifater®, Ritalin®

Rifampin may be confused with ribavirin, rifabutin, Rifamate®, rifapentine, rifaximin

Pronunciation(rif AM pin)

U.S. Brand NamesRifadin®

Canadian Brand NamesRifadin®; Rofact™

Pharmacologic CategoryAntibiotic, Miscellaneous; Antitubercular Agent

Use: Labeled IndicationsManagement of active tuberculosis in combination with other agents; elimination of meningococci from the nasopharynx in asymptomatic carriers

Use: Unlabeled/InvestigationalProphylaxis of *Haemophilus influenzae* type b infection; *Legionella* pneumonia; used in combination with other anti-infectives in the treatment of staphylococcal infections; treatment of *M. leprae* infections

Dosing: Adults

Tuberculosis, active: Oral, I.V.: **Note:** A four-drug regimen (isoniazid, rifampin, pyrazinamide, and ethambutol) is preferred for the initial, empiric treatment of TB. When the drug susceptibility results are available, the regimen should be altered as appropriate.

Daily therapy: 10 mg/kg/day (maximum: 600 mg/day)

Twice weekly directly observed therapy (DOT): 10 mg/kg (maximum: 600 mg); 3 times/week: 10 mg/kg (maximum: 600 mg)

Tuberculosis, latent infection (LTBI): As an alternative to isoniazid: Oral, I.V.: 10 mg/kg/day (maximum: 600 mg/day) for 4 months. **Note:** Combination with pyrazinamide should not generally be offered (*MMWR*, Aug 8, 2003).

***H. influenzae*prophylaxis (unlabeled use):** Oral, I.V.: 600 mg every 24 hours for 4 days

Leprosy (unlabeled use): Oral, I.V.:

Multibacillary: 600 mg once monthly for 24 months in combination with ofloxacin and minocycline

Paucibacillary: 600 mg once monthly for 6 months in combination with dapsone

Single lesion: 600 mg as a single dose in combination with ofloxacin 400 mg and minocycline 100 mg

Meningococcal meningitis prophylaxis (unlabeled use): Oral, I.V.: 600 mg every 12 hours for 2 days

Meningitis*(Pneumococcus*or*Staphylococcus)*(unlabeled use): Oral, I.V.: 600 mg once daily

Nasal carriers of*Staphylococcus aureus*(unlabeled use): Oral, I.V.: 600 mg/day for 5-10 days in combination with other antibiotics

Nontuberculous mycobacterium (*M. kansasii*) (unlabeled use): Oral, I.V.: 10 mg/kg/day (maximum: 600 mg/day) for duration to include 12 months of culture-negative sputum; typically used in combination with ethambutol and isoniazid

Synergy for*Staphylococcus aureus*infections (unlabeled use): Oral, I.V.: 300-600 mg twice daily with other antibiotics

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Tuberculosis, active: Oral, I.V.:

Infants and Children <12 years:

Daily therapy: 10-20 mg/kg/day usually as a single dose (maximum: 600 mg/day)

Twice weekly directly observed therapy (DOT): 10-20 mg/kg (maximum: 600 mg)

See "Note" in adult dosing.

Tuberculosis, latent infection (LTBI): As an alternative to isoniazid: Children: 10-20 mg/kg/day (maximum: 600 mg/day) for 6 months

***H. influenzae*prophylaxis (unlabeled use):** Oral, I.V.: Infants and Children: 20 mg/kg/day every 24 hours for 4 days, not to exceed 600 mg/dose

Meningitis*(Pneumococcus*or*Staphylococcus)* (unlabeled use):Oral, I.V.: Infants and Children: 20 mg/kg/day as a single dose or in 2 divided doses; maximum: 600 mg/day

Note: Recommended only for organisms known to be rifampin-susceptible and highly penicillin- or cephalosporin-resistant. May be used in place of or in addition to vancomycin when dexamethasone therapy employed.

Meningococcal prophylaxis (unlabeled use): Oral:

<1 month: 10 mg/kg/day in divided doses every 12 hours for 2 days

Infants and Children: 20 mg/kg/day in divided doses every 12 hours for 2 days (maximum: 600 mg/dose)

Nasal carriers of *Staphylococcus aureus* (unlabeled use): Oral, I.V.: 15 mg/kg/day divided every 12 hours for 5-10 days in combination with other antibiotics

Dosing: Renal ImpairmentPlasma rifampin concentrations are not significantly affected by hemodialysis or peritoneal dialysis.
Dosing: Hepatic ImpairmentDose reductions are necessary to reduce hepatotoxicity.
Administration: I.M.Do not administer I.M. or SubQ
Administration: I.V.Administer I.V. preparation once daily by slow I.V. infusion over 30 minutes to 3 hours at a final concentration not to exceed 6 mg/mL.
Administration: I.V. DetailAvoid extravasation.

pH: 7.8-8.8

Administration: OralAdminister on an empty stomach with a glass of water (ie, 1 hour prior to, or 2 hours after meals or antacids) to increase total absorption (food may delay and reduce the amount of rifampin absorbed). The compounded oral suspension must be shaken well before using. May mix contents of capsule with applesauce or jelly.
Dietary ConsiderationsRifampin should be taken on an empty stomach.
StorageRifampin powder is reddish brown. Intact vials should be stored at room temperature and protected from excessive heat and light. Reconstituted vials are stable for 24 hours at room temperature.

Stability of parenteral admixture at room temperature (25°C) is 4 hours for D_5W and 24 hours for NS.

ReconstitutionReconstitute powder for injection with SWFI. Prior to injection, dilute in appropriate volume of compatible diluent (eg, 100 mL D_5W).
Compatibility**Variable stability (consult detailed reference)** in D_5W, NS.

Y-site administration: Incompatible: Diltiazem.

Compatibility when admixed: Incompatible: Minocycline.

Extemporaneously PreparedFor pediatric and adult patients with difficulty swallowing or where lower doses are needed, the package insert lists an extemporaneous liquid suspension as follows:

Rifampin 1% w/v suspension (10 mg/mL) can be compounded using one of four syrups (Syrup NF, simple syrup, Syrpalta® syrup, or raspberry syrup)

Empty contents of four 300 mg capsules or eight 150 mg capsules onto a piece of weighing paper

If necessary, crush contents to produce a fine powder

Transfer powder blend to a 4 oz amber glass or plastic prescription bottle

Rinse paper and spatula with 20 mL of syrup and add the rinse to bottle; shake vigorously

Add 100 mL of syrup to the bottle and shake vigorously

This compounding procedure results in a 1% w/v suspension containing 10 mg rifampin/mL; stability studies indicate suspension is stable at room temperature (25°C ± 3°C) or in refrigerator (2°C to 8°C) for 4 weeks; shake well prior to administration

ContraindicationsHypersensitivity to rifampin, any rifamycins, or any component of the formulation; concurrent use of amprenavir, saquinavir/ritonavir (possibly other protease inhibitors)
Allergy Considerations

- Rifamycin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Flu-like syndrome: Regimens of >600 mg once or twice weekly have been associated with a high incidence of adverse reactions including a flu-like syndrome.

- Hematologic effects: May cause thrombocytopenia, leukopenia, or anemia with regimens >600 mg once or twice weekly.

- Hyperbilirubinemia: Discontinue therapy if this occurs in conjunction with clinical symptoms or any signs of significant hepatocellular damage develop.

- Hypersensitivity: Hypersensitivity reactions have occurred in patients taking >600 mg once or twice weekly.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Alcoholism: Use with caution in patients with a history of alcoholism (even if ethanol consumption is discontinued during therapy).
- Hepatic impairment: Use with caution in patients with liver impairment; dosage modification recommended.
- Meningococcal disease: Do not use for meningococcal disease, only for short-term treatment of asymptomatic carrier states.
- Porphyria: Use with caution in patients with porphyria; exacerbations have been reported due to enzyme-inducing properties.

Concurrent drug therapy issues:

- Medications associated with hepatotoxicity: Use with caution in patients receiving concurrent medications associated with hepatotoxicity.

Other warnings/precautions:

- Appropriate administration: Do not administer I.V. form via I.M. or SubQ routes; restart infusion at another site if extravasation occurs.
- Compliance: Monitor for compliance in patients on intermittent therapy.
- Contact lenses: Remove soft contact lenses during therapy since permanent staining may occur.
- Red/orange discoloration: Urine, feces, saliva, sweat, tears, and CSF may be discolored to red/orange.

Geriatric ConsiderationsRifampin, in combination with isoniazid, is the foundation of tuberculosis treatment. Since most older patients acquired their *Mycobacterium tuberculosis* infection before effective chemotherapy was available, either a 9-month regimen of isoniazid and rifampin or a 6-month regimen of isoniazid and rifampin with pyrazinamide (the first 2 months) should be effective.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects have bee reported in animal studies. Rifampin crosses the human placenta. Due to the risk of tuberculosis to the fetus, treatment is recommended when the probability of maternal disease is moderate to high. Postnatal hemorrhages have been reported in the infant and mother with isoniazid administration during the last few weeks of pregnancy.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Adverse Reactions

Frequency not defined:

Cardiovascular: Edema, flushing

Central nervous system: Ataxia, behavioral changes, concentration impaired, confusion, dizziness, drowsiness, fatigue, fever, headache, numbness, psychosis

Dermatologic: Pemphigoid reaction, pruritus, urticaria

Endocrine & metabolic: Adrenal insufficiency, menstrual disorders

Hematologic: Agranulocytosis (rare), DIC, eosinophilia, hemoglobin decreased, hemolysis, hemolytic anemia, leukopenia, thrombocytopenia (especially with high-dose therapy)

Hepatic: Hepatitis (rare), jaundice

Neuromuscular & skeletal: Myalgia, osteomalacia, weakness

Ocular: Exudative conjunctivitis, visual changes

Renal: Acute renal failure, BUN increased, hemoglobinuria, hematuria, interstitial nephritis, uric acid increased

Miscellaneous: Flu-like syndrome

1% to 10%:

Dermatologic: Rash (1% to 5%)

Gastrointestinal (1% to 2%): Anorexia, cramps, diarrhea, epigastric distress, flatulence, heartburn, nausea, pseudomembranous colitis, pancreatitis vomiting

Hepatic: LFTs increased (up to 14%)

Metabolism/Transport Effects**Induces** CYP1A2 (strong), 2A6 (strong), 2B6 (strong), 2C8 (strong), 2C9 (strong), 2C19 (strong), 3A4 (strong)

Drug Interactions

Alfentanil: Rifamycin Derivatives may increase the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Amiodarone: Rifamycin Derivatives may increase the metabolism of Amiodarone. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Rifamycin Derivatives may increase the metabolism of Angiotensin II Receptor Blockers. **Exceptions:** Candesartan; Eprosartan; Olmesartan; Telmisartan; Valsartan. *Risk C: Monitor therapy*

Antidiabetic Agents (Thiazolidinedione): Rifampin may increase the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Antiemetics (5HT3 Antagonists): Rifamycin Derivatives may increase the metabolism of Antiemetics (5HT3 Antagonists). **Exceptions:** Dolasetron; Granisetron; Palonosetron. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Rifamycin Derivatives. Only rifabutin appears to be affected. Rifamycin Derivatives may decrease the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Aprepitant: Rifamycin Derivatives may increase the metabolism of Aprepitant. *Risk C: Monitor therapy*

Atazanavir: Rifampin may decrease the serum concentration of Atazanavir. *Risk X: Avoid combination*

Atovaquone: Rifamycin Derivatives may decrease the serum concentration of Atovaquone. *Risk D: Consider therapy modification*

Barbiturates: Rifamycin Derivatives may increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Bendamustine: CYP1A2 Inducers (Strong) may decrease the serum concentration of Bendamustine. Concentrations of active metabolites may be increased. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Rifamycin Derivatives may increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Beta-Blockers: Rifamycin Derivatives may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Carteolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

BusPIRone: Rifamycin Derivatives may increase the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Rifamycin Derivatives may increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Caspofungin: Rifampin may decrease the serum concentration of Caspofungin. Management: Caspofungin prescribing information recommends using a dose of 70mg daily in adults (or 70mg/m^2, up to a maximum of 70mg, daily in pediatric patients) who are also receiving rifampin. *Risk D: Consider therapy modification*

Caspofungin: Inducers of Drug Clearance may decrease the serum concentration of Caspofungin. Management: Consider using an increased caspofungin dose of 70mg daily in adults (or 70mg/m^2, up to a maximum of 70mg, daily in pediatric patients) when coadministered with known inducers of drug clearance. *Risk D: Consider therapy modification*

Chloramphenicol: Rifampin may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

Clopidogrel: Rifamycin Derivatives may enhance the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Contraceptive (Progestins): Rifamycin Derivatives may decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Rifamycin Derivatives may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Rifamycin Derivatives may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP1A2 Substrates: CYP1A2 Inducers (Strong) may increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP2A6 Substrates: CYP2A6 Inducers (Strong) may increase the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Substrates: CYP2B6 Inducers (Strong) may increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inducers (Strong) may increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inducers (Highly Effective) may increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inducers (Highly Effective) may increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inducers may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dapsone: Rifamycin Derivatives may increase the metabolism of Dapsone. *Risk D: Consider therapy modification*

Delavirdine: May decrease the metabolism of Rifamycin Derivatives. Rifamycin Derivatives may increase the metabolism of Delavirdine. *Risk D: Consider therapy modification*

Disopyramide: Rifamycin Derivatives may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Efavirenz: Rifampin may decrease the serum concentration of Efavirenz. Management: Efavirenz dose adjustment (to 800mg daily) may be required, particularly for patients weighing more than 60kg. *Risk C: Monitor therapy*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Erlotinib: Rifampin may increase the metabolism of Erlotinib. *Risk D: Consider therapy modification*

Etravirine: Rifamycin Derivatives may decrease the serum concentration of Etravirine. *Risk X: Avoid combination*

Exemestane: Rifampin may increase the metabolism of Exemestane. *Risk D: Consider therapy modification*

FentaNYL: Rifamycin Derivatives may decrease the serum concentration of FentaNYL. *Risk C: Monitor therapy*

Fexofenadine: Rifampin may decrease the serum concentration of Fexofenadine. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Rifamycin Derivatives. This appears only affect rifabutin. Rifamycin Derivatives may increase the metabolism of Fluconazole. *Risk C: Monitor therapy*

Fosaprepitant: Rifampin may decrease the serum concentration of Fosaprepitant. More specifically, rifampin may decrease concentrations of the active metabolite aprepitant. *Risk C: Monitor therapy*

Gefitinib: Rifamycin Derivatives may increase the metabolism of Gefitinib. *Risk D: Consider therapy modification*

HMG-CoA Reductase Inhibitors: Rifamycin Derivatives may increase the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Rosuvastatin. *Risk D: Consider therapy modification*

Imatinib: Rifamycin Derivatives may increase the metabolism of Imatinib. *Risk D: Consider therapy modification*

Isoniazid: Rifamycin Derivatives may enhance the hepatotoxic effect of Isoniazid. Even so, this is a frequently employed combination regimen. *Risk C: Monitor therapy*

LamoTRIgine: Rifampin may increase the metabolism of LamoTRIgine. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Rifamycin Derivatives. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methadone: Rifamycin Derivatives may increase the metabolism of Methadone. *Risk C: Monitor therapy*

Morphine Sulfate: Rifamycin Derivatives may decrease the serum concentration of Morphine Sulfate. *Risk C: Monitor therapy*

Mycophenolate: Rifamycin Derivatives may decrease the serum concentration of Mycophenolate. Specifically, rifamycin derivatives may decrease the concentration of the active metabolite mycophenolic acid. *Risk X: Avoid combination*

Nevirapine: Rifampin may decrease the serum concentration of Nevirapine. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): Rifamycin Derivatives may decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inducers may decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: Rifamycin Derivatives may increase the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Praziquantel: Rifampin may decrease the serum concentration of Praziquantel. *Risk X: Avoid combination*

Propafenone: Rifamycin Derivatives may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the metabolism of Rifamycin Derivatives. Specifically rifabutin. Rifamycin Derivatives may decrease the serum concentration of Protease Inhibitors. Rifampin administration should be avoided. Dosage adjustments with both rifabutin and the protease inhibitors are necessary if used together. Management: Avoid using rifampin with protease inhibitors. Rifabutin and protease inhibitor dose adjustments will likely be required when using rifabutin together with protease inhibitors; consult specific protease inhibitor(s) prescribing information. *Risk D: Consider therapy modification*

Pyrazinamide: May enhance the hepatotoxic effect of Rifampin. Severe (even fatal) liver injury has been reported in patients receiving these 2 drugs as a 2-month treatment regimen for latent TB infection. *Risk D: Consider therapy modification*

QuiNIDine: Rifamycin Derivatives may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Raltegravir: Rifampin may decrease the serum concentration of Raltegravir. *Risk C: Monitor therapy*

Ramelteon: Rifamycin Derivatives may increase the metabolism of Ramelteon. *Risk C: Monitor therapy*

Ranolazine: Rifampin may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Repaglinide: Rifamycin Derivatives may increase the metabolism of Repaglinide. *Risk C: Monitor therapy*

Sirolimus: Rifampin may increase the metabolism of Sirolimus. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Sulfonylureas: Rifampin may increase the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Sunitinib: Rifamycin Derivatives may increase the metabolism of Sunitinib. *Risk D: Consider therapy modification*

Tacrolimus: Rifamycin Derivatives may increase the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Tamoxifen: Rifamycin Derivatives may increase the metabolism of Tamoxifen. *Risk C: Monitor therapy*

Temsirolimus: Rifamycin Derivatives may decrease the serum concentration of Temsirolimus. Rifamycins will likely cause an even greater decrease in the concentration of the active metabolite sirolimus. Management: Temsirolimus prescribing information recommends against coadministration with strong CYP3A4 inducers such as rifampin; however, if concurrent therapy is necessary, an increase in temsirolimus dose to 50 mg/week should be considered. *Risk D: Consider therapy modification*

Terbinafine: Rifamycin Derivatives may increase the metabolism of Terbinafine. *Risk D: Consider therapy modification*

Thyroid Products: Rifampin may decrease the serum concentration of Thyroid Products. *Risk C: Monitor therapy*

Tocainide: Rifamycin Derivatives may increase the metabolism of Tocainide. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Valproic Acid: Rifampin may decrease the serum concentration of Valproic Acid. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Rifamycin Derivatives may increase the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Voriconazole: May increase the serum concentration of Rifamycin Derivatives. Rifamycin Derivatives may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Zaleplon: Rifamycin Derivatives may increase the metabolism of Zaleplon. *Risk C: Monitor therapy*

Zidovudine: Rifamycin Derivatives may increase the metabolism of Zidovudine. *Risk D: Consider therapy modification*

Zolpidem: Rifamycin Derivatives may increase the metabolism of Zolpidem. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase risk of hepatotoxicity).

Food: Food decreases the extent of absorption; rifampin concentrations may be decreased if taken with food.

Herb/Nutraceutical: St John's wort may decrease rifampin levels.

Test InteractionsPositive Coombs' reaction [direct], rifampin inhibits standard assay's ability to measure serum folate and B_{12}; transient increase in LFTs and decreased biliary excretion of contrast media

Monitoring ParametersPeriodic (baseline and every 2-4 weeks during therapy) monitoring of liver function (AST, ALT, bilirubin), CBC; hepatic status and mental status, sputum culture, chest x-ray 2-3 months into treatment

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents patient may be taking (eg, concurrent use with rifampin may decrease levels/effects of multiple other drugs, including some oral contraceptives, anticoagulants, hypoglycemics, and beta-blockers). See Administration for infusion specifics; infusion site must be monitored to prevent extravasation. Assess results of periodic laboratory tests and chest x-ray, therapeutic effectiveness, and adverse reactions (eg, hypersensitivity reactions, hepatotoxicity, CNS changes, hematologic changes, visual disturbances, and gastrointestinal upset) on a regular basis during therapy. Monitor patient compliance with treatment regimen. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsPeriodic monitoring of liver function (AST, ALT), CBC; sputum culture, chest x-ray 2-3 months into treatment

Patient EducationDo not take any new medication during therapy without consulting prescriber. Rifampin may be prescribed in conjunction with another medication; maintain dosing schedule of both drugs as directed. Take rifampin on an empty stomach, 1 hour before or 2 hours after meals. It is extremely important that you complete full course of therapy and do not skip doses. Keep appointments for scheduled laboratory tests and chest x-rays. This medication will discolor urine, stool, saliva, tears, sweat, and other body fluid a red-brown color. Stains on contact lenses and clothing are permanent. Report persistent vomiting or diarrhea; rash; fever, chills, or flu-like symptoms; unusual bruising or bleeding; or other persistent adverse effects. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant. This drug may interfere with effectiveness of oral/systemic contraceptives; consult prescriber for alternative contraceptive measures.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 150 mg, 300 mg

Injection, powder for reconstitution: 600 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Rifadin)

150 mg (60): $136.70

Mechanism of ActionInhibits bacterial RNA synthesis by binding to the beta subunit of DNA-dependent RNA polymerase, blocking RNA transcription

Pharmacodynamics/Kinetics

Duration: ≤24 hours

Absorption: Oral: Well absorbed; food may delay or slightly reduce peak

Distribution: Highly lipophilic; crosses blood-brain barrier well

Relative diffusion from blood into CSF: Adequate with or without inflammation (exceeds usual MICs)

CSF:blood level ratio: Inflamed meninges: 25%

Protein binding: 80%

Metabolism: Hepatic; undergoes enterohepatic recirculation

Half-life elimination: 3-4 hours; prolonged with hepatic impairment; End-stage renal disease: 1.8-11 hours

Time to peak, serum: Oral: 2-4 hours

Excretion: Feces (60% to 65%) and urine (~30%) as unchanged drug

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness, dizziness, confusion, behavioral changes, or ataxia; report of cognitive disturbances, delusions, and hallucinations

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; rifampin is a potent hepatic enzyme inducer; monitor for altered clinical effects when used concurrently with psychotropics

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: Rifampin causes body secretions to turn orange and may stain contact lenses.

Index TermsRifampicin

Rifapentine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Rifapentine may be confused with rifampin

Pronunciation(rif a PEN teen)

U.S. Brand NamesPriftin®

Canadian Brand NamesPriftin®

Pharmacologic CategoryAntitubercular Agent

Use: Labeled IndicationsTreatment of pulmonary tuberculosis; rifapentine must always be used in conjunction with at least one other antituberculosis drug to which the isolate is susceptible; it may also be necessary to add a third agent (either streptomycin or ethambutol) until susceptibility is known.

Dosing: Adults**Note: Rifapentine should not be used alone**; initial phase should include a 3- to 4-drug regimen.

Tuberculosis, intensive phase (initial 2 months) of short-term therapy: 600 mg (four 150 mg tablets) given twice weekly (with an interval of not less than 72 hours between doses); following the intensive phase, treatment should continue with rifapentine 600 mg once weekly for 4 months in combination with INH or appropriate agent for susceptible organisms.

Dosing: ElderlyRefer to adult dosing.

StorageStore at room temperature (15°C to 30°C; 59°F to 86°F). Protect from excessive heat and humidity.

ContraindicationsHypersensitivity to rifapentine, rifampin, rifabutin, any rifamycin analog, or any component of the formulation

Allergy Considerations

- Rifamycin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hepatic impairment: Patients with abnormal liver tests and/or liver disease should only be given rifapentine when absolutely necessary and under strict medical supervision. Monitoring of liver function tests should be carried out prior to therapy and then every 2-4 weeks during therapy if signs of liver disease occur or worsen, rifapentine should be discontinued.

- Porphyria: Use with caution in patients with porphyria; exacerbation is possible.

Special populations:

- HIV-infected patients: Experience in treating TB in HIV-infected patients is limited.

Other warnings/precautions:

- Compliance: Compliance with dosing regimen is absolutely necessary for successful drug therapy.

- Contact lenses: Remove soft contact lenses during therapy since permanent staining may occur.

- Monitoring: All patients treated with rifapentine should have baseline measurements of liver function tests and enzymes, bilirubin, and a complete blood count. Patients should be seen monthly and specifically questioned regarding symptoms associated with adverse reactions. Routine laboratory monitoring in people with normal baseline measurements is generally not necessary.

- Red/orange discoloration: Urine, feces, saliva, sweat, tears, skin, teeth, tongue, and CSF may be discolored to red/orange.

Pregnancy Risk FactorC

Pregnancy ConsiderationsHas been shown to be teratogenic in rats and rabbits. Rat offspring showed cleft palates, right aortic arch, and delayed ossification and increased number of ribs. Rabbits displayed ovarian agenesis, pes varus, arhinia, microphthalmia, and irregularities of the ossified facial tissues. Rat studies also show decreased fetal weight, increased number of stillborns, and decreased gestational survival. There are no adequate and well-controlled studies in pregnant women. Rifapentine should be used during pregnancy only if the potential benefits justifies the potential risk to the fetus.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsMay discolor breast milk

Adverse Reactions

>10%: Endocrine & metabolic: Hyperuricemia (most likely due to pyrazinamide from initiation phase combination therapy)

1% to 10%:

Cardiovascular: Hypertension

Central nervous system: Dizziness, headache

Dermatologic: Acne, pruritus, rash

Gastrointestinal: Anorexia, diarrhea, dyspepsia, nausea, vomiting

Hematologic: Anemia, leukopenia, lymphopenia, neutropenia, thrombocytosis

Hepatic: ALT increased, AST increased

Neuromuscular & skeletal: Arthralgia, pain

Renal: Hematuria, proteinuria, pyuria, urinary casts

Respiratory: Hemoptysis

<1%: Aggressive reaction, alkaline phosphatase increased, arthrosis, bilirubinemia, constipation, esophagitis, fatigue, gastritis, gout, hematoma, hepatitis, hyperkalemia, hypovolemia, LDH increased, leukocytosis, neutrophilia, pancreatitis, peripheral edema, purpura, skin discoloration, thrombocytopenia, urticaria

Postmarketing and/or case reports: Rifampin has been associated with exacerbation of porphyria. Rifapentine is assumed to share this potential.

Metabolism/Transport Effects **Induces** CYP2C8 (strong), 2C9 (strong), 3A4 (strong)

Drug Interactions

Alfentanil: Rifamycin Derivatives may increase the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Amiodarone: Rifamycin Derivatives may increase the metabolism of Amiodarone. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Rifamycin Derivatives may increase the metabolism of Angiotensin II Receptor Blockers. **Exceptions:** Candesartan; Eprosartan; Olmesartan; Telmisartan; Valsartan. *Risk C: Monitor therapy*

Antiemetics (5HT3 Antagonists): Rifamycin Derivatives may increase the metabolism of Antiemetics (5HT3 Antagonists). **Exceptions:** Dolasetron; Granisetron; Palonosetron. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Rifamycin Derivatives. Only rifabutin appears to be affected. Rifamycin Derivatives may decrease the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Aprepitant: Rifamycin Derivatives may increase the metabolism of Aprepitant. *Risk C: Monitor therapy*

Atovaquone: Rifamycin Derivatives may decrease the serum concentration of Atovaquone. *Risk D: Consider therapy modification*

Barbiturates: Rifamycin Derivatives may increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Rifamycin Derivatives may increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Beta-Blockers: Rifamycin Derivatives may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Carteolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

BusPIRone: Rifamycin Derivatives may increase the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Rifamycin Derivatives may increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Clopidogrel: Rifamycin Derivatives may enhance the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Contraceptive (Progestins): Rifamycin Derivatives may decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Rifamycin Derivatives may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Rifamycin Derivatives may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2C8 Substrates (High risk): CYP2C8 Inducers (Highly Effective) may increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inducers (Highly Effective) may increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dapsone: Rifamycin Derivatives may increase the metabolism of Dapsone. *Risk D: Consider therapy modification*

Delavirdine: May decrease the metabolism of Rifamycin Derivatives. Rifamycin Derivatives may increase the metabolism of Delavirdine. *Risk D:*

Consider therapy modification

Disopyramide: Rifamycin Derivatives may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Etravirine: Rifamycin Derivatives may decrease the serum concentration of Etravirine. *Risk X: Avoid combination*

FentaNYL: Rifamycin Derivatives may decrease the serum concentration of FentaNYL. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Rifamycin Derivatives. This appears only affect rifabutin. Rifamycin Derivatives may increase the metabolism of Fluconazole. *Risk C: Monitor therapy*

Gefitinib: Rifamycin Derivatives may increase the metabolism of Gefitinib. *Risk D: Consider therapy modification*

HMG-CoA Reductase Inhibitors: Rifamycin Derivatives may increase the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Rosuvastatin. *Risk D: Consider therapy modification*

Imatinib: Rifamycin Derivatives may increase the metabolism of Imatinib. *Risk D: Consider therapy modification*

Isoniazid: Rifamycin Derivatives may enhance the hepatotoxic effect of Isoniazid. Even so, this is a frequently employed combination regimen. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methadone: Rifamycin Derivatives may increase the metabolism of Methadone. *Risk C: Monitor therapy*

Morphine Sulfate: Rifamycin Derivatives may decrease the serum concentration of Morphine Sulfate. *Risk C: Monitor therapy*

Mycophenolate: Rifamycin Derivatives may decrease the serum concentration of Mycophenolate. Specifically, rifamycin derivatives may decrease the concentration of the active metabolite mycophenolic acid. *Risk X: Avoid combination*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): Rifamycin Derivatives may decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: Rifamycin Derivatives may increase the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Propafenone: Rifamycin Derivatives may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the metabolism of Rifamycin Derivatives. Specifically rifabutin. Rifamycin Derivatives may decrease the serum concentration of Protease Inhibitors. Rifampin administration should be avoided. Dosage adjustments with both rifabutin and the protease inhibitors are necessary if used together. Management: Avoid using rifampin with protease inhibitors. Rifabutin and protease inhibitor dose adjustments will likely be required when using rifabutin together with protease inhibitors; consult specific protease inhibitor(s) prescribing information. *Risk D: Consider therapy modification*

QuiNIDine: Rifamycin Derivatives may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Ramelteon: Rifamycin Derivatives may increase the metabolism of Ramelteon. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Repaglinide: Rifamycin Derivatives may increase the metabolism of Repaglinide. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Sunitinib: Rifamycin Derivatives may increase the metabolism of Sunitinib. *Risk D: Consider therapy modification*

Tacrolimus: Rifamycin Derivatives may increase the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Tamoxifen: Rifamycin Derivatives may increase the metabolism of Tamoxifen. *Risk C: Monitor therapy*

Temsirolimus: Rifamycin Derivatives may decrease the serum concentration of Temsirolimus. Rifamycins will likely cause an even greater decrease in the concentration of the active metabolite sirolimus. Management: Temsirolimus prescribing information recommends against coadministration with strong CYP3A4 inducers such as rifampin; however, if concurrent therapy is necessary, an increase in temsirolimus dose to 50 mg/week should be considered. *Risk D: Consider therapy modification*

Terbinafine: Rifamycin Derivatives may increase the metabolism of Terbinafine. *Risk D: Consider therapy modification*

Tocainide: Rifamycin Derivatives may increase the metabolism of Tocainide. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Rifamycin Derivatives may increase the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Voriconazole: May increase the serum concentration of Rifamycin Derivatives. Rifamycin Derivatives may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Zaleplon: Rifamycin Derivatives may increase the metabolism of Zaleplon. *Risk C: Monitor therapy*

Zidovudine: Rifamycin Derivatives may increase the metabolism of Zidovudine. *Risk D: Consider therapy modification*

Zolpidem: Rifamycin Derivatives may increase the metabolism of Zolpidem. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Food increases AUC and maximum serum concentration by 43% and 44% respectively as compared to fasting conditions.

Test InteractionsRifampin has been shown to inhibit standard microbiological assays for serum folate and vitamin B_{12}; this should be considered for rifapentine; therefore, alternative assay methods should be considered.

Monitoring ParametersPatients with pre-existing hepatic problems should have liver function tests monitored every 2-4 weeks during therapy

Nursing: Physical Assessment/MonitoringFor use in combination with other antitubercular medications. Use caution in presence of liver disease. Assess potential for interactions with other pharmacological agents patient may be taking (eg, concurrent use with rifapentine may decrease levels/effects of multiple other drugs, including some oral contraceptives, anticoagulants, hypoglycemics, and beta-blockers). Evaluate results of baseline and periodic laboratory tests and chest x-ray, therapeutic effectiveness, and adverse reactions (eg, hepatotoxicity, CNS changes, hematologic changes, visual disturbances, and gastrointestinal upset) on a regular basis during therapy. Monitor patient compliance with treatment regimen. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsPerform baseline liver function tests at beginning of therapy. Patients with pre-existing hepatic problems should have liver function tests monitored every 2-4 weeks during therapy. Perform CBC monthly.

Patient EducationDo not take any new medication during therapy without consulting prescriber. Rifapentine will be prescribed in conjunction with other medications; maintain dosing schedule as directed. It is extremely important that you complete full course of therapy and do not skip doses. Keep appointments for scheduled laboratory tests and chest x-rays. This medication will discolor urine, stool, saliva, tears, sweat, breast milk, and other body fluids a red-brown color. Stains on contact lenses and clothing are permanent. Report persistent vomiting or diarrhea; rash; fever, chills, or flu-like symptoms; unusual bruising or bleeding; yellowing of skin or sclera, pale stool, or other persistent adverse effects. **Pregnancy precaution:** Inform prescriber is you are or intend to become pregnant. This drug may interfere with effectiveness of oral/systemic contraceptives; consult prescriber for alternative contraceptive measures.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 150 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Priftin)

150 mg (32): $120.98

Mechanism of ActionInhibits DNA-dependent RNA polymerase in susceptible strains of *Mycobacterium tuberculosis* (but not in mammalian cells). Rifapentine is bactericidal against both intracellular and extracellular MTB organisms. MTB resistant to other rifamycins including rifampin are likely to be resistant to rifapentine. Cross-resistance does not appear between rifapentine and other nonrifamycin antimycobacterial agents.

Pharmacodynamics/Kinetics

Absorption: Food increases AUC and C_{max} by 43% and 44% respectively.

Distribution: V_d: ~70.2 L; rifapentine and metabolite accumulate in human monocyte-derived macrophages with intracellular/extracellular ratios of 24:1 and 7:1 respectively

Protein binding: Rifapentine and 25-desacetyl metabolite: 97.7% and 93.2%, primarily to albumin

Metabolism: Hepatic; hydrolyzed by an esterase and esterase enzyme to form the active metabolite 25-desacetyl rifapentine

Bioavailability: ~70%

Half-life elimination: Rifapentine: 14-17 hours; 25-desacetyl rifapentine: 13 hours

Time to peak, serum: 5-6 hours

Excretion: Urine (17% primarily as metabolites)

Pharmacotherapy PearlsRifapentine has only been studied in patients with tuberculosis receiving a 6-month short-course intensive regimen approval. Outcomes have been based on 6-month follow-up treatment observed in clinical trial 008 as a surrogate for the 2-year follow-up generally accepted as evidence for efficacy in the treatment of pulmonary tuberculosis.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness; has rarely been associated with aggression

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine; rifapentine is an inducer of CYP3A4; monitor of altered clinical effects with barbiturates, benzodiazepines, phenytoin, beta-blockers, haloperidol and TCAs.

International Brand NamesPriftin (CA)

Rifaximin

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Rifaximin may be confused with rifampin

Pronunciation(rif AX i min)
U.S. Brand NamesXifaxan™
Pharmacologic CategoryAntibiotic, Miscellaneous
Use: Labeled IndicationsTreatment of travelers' diarrhea caused by noninvasive strains of *E. coli*
Dosing: Adults**Travelers' diarrhea:** Oral: 200 mg 3 times/day for 3 days
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Travelers' diarrhea:** Oral: Children ≥12 years: Refer to adult dosing.
Administration: OralMay be administered with or without food.
Dietary ConsiderationsMay be taken with or without food.
StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).
ContraindicationsHypersensitivity to rifaximin, other rifamycin antibiotics, or any component of the formulation; diarrhea with fever or blood in the stool
Allergy Considerations

- Rifamycin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Diarrhea: Appropriate use: Efficacy has not been established for the treatment of diarrhea due to pathogens other than *E. coli*, including *C. jejuni*, *Shigella*, and *Salmonella*; consider alternative therapy if symptoms persist or worsen after 24-48 hours of treatment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Appropriate use: Not for treatment of systemic infections; <1% is absorbed orally.

Geriatric ConsiderationsRifaximin has not been studied in the elderly.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAdverse events have been observed in animal reproduction studies; therefore, the manufacturer classifies rifaximin as pregnancy category C. Due to the limited oral absorption of rifaximin (<0.4%), exposure to the fetus is expected to be extremely low.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsIt is not known if rifaximin is excreted in human milk. Due to the limited oral absorption of rifaximin (<0.4%), exposure to the nursing infant is expected to be extremely low. Use of rifaximin during breast-feeding is not recommended by the manufacturer.
Pregnancy & Lactation, In-Depth

- Rifaximin in Pregnancy & Lactation

Adverse ReactionsIncidence of adverse effects reported as ≥2% occurred more in the placebo group than the rifaximin group except for headache.

2% to 10%: Central nervous system: Headache (10%; placebo 9%)

<2%, postmarketing, and/or case reports (limited to important or life-threatening): Abnormal dreams, allergic dermatitis, angioneurotic edema (includine tongue and facial edema with dysphagia), exfoliative dermatitis, fatigue, flushing, hypersensitivity reactions, insomnia, motion sickness, pruritus, rash, sunburn, tinnitus, urticaria

Metabolism/Transport Effects**Induces** CYP3A4 (minor)
Drug Interactions

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Monitoring ParametersTemperature, blood in stool, change in symptoms

Nursing: Physical Assessment/MonitoringSee Contraindications and Warnings/Precautions for use cautions. Cause of diarrhea should be ascertained prior to administering. Teach patient proper use, possible side effects/interventions, and adverse symptoms to report (see Patient Education). **Pregnancy risk factor C** - benefits of use should outweigh possible risks. Note breast-feeding caution.

Patient EducationInform prescriber of any allergies you may have. Take exactly as directed. May cause headache (consult prescriber if headache acute). Report skin rash, swelling of lips or mouth, abnormal dreams or inability to sleep, or unusual ringing in ears. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 200 mg

Generic AvailableNo

ManufacturerSalix Pharmaceuticals, Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Xifaxan)

200 mg (30): $160.99

Mechanism of ActionRifaximin inhibits bacterial RNA synthesis by binding to bacterial DNA-dependent RNA polymerase.

Pharmacodynamics/Kinetics

Absorption: Oral: <0.4%

Distribution: 80% to 90% in the gut

Half-life elimination: ~6 hours

Excretion: Feces (~97% as unchanged drug); urine (<1%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause abnormal dreams, insomnia, or fatigue

Mental Health: Effects on Psychiatric TreatmentNone reported

International Brand NamesColoximina (AR); Flonorm (CO, MX); Lormyx (CL); Normix (BG, CZ, HN, IT, KP); Spiraxin (ES); Zaxine (ES)

Rilonacept

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ri LON a sept)

U.S. Brand NamesArcalyst™

Pharmacologic CategoryInterleukin-1 Inhibitor

Use: Labeled Indications**Orphan drug:** Treatment of cryopyrin-associated periodic syndromes (CAPS) including familial cold autoinflammatory syndrome (FCAS) and Muckle-Wells syndrome (MWS)

Dosing: Adults**Cryopyrin-associated periodic syndromes:** SubQ: Loading dose 320 mg given as 2 separate injections (160 mg each) on the same day at 2 different sites, followed a week later by 160 mg, then once weekly. **Note:** Do not administer more frequently than once weekly.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Cryopyrin-associated periodic syndromes:** Children ≥12 years: SubQ: Loading dose 4.4 mg/kg (maximum dose: 320 mg) given as 1-2 separate injections (maximum: 2 mL/injection) on the same day, followed by 2.2 mg/kg (maximum dose: 160 mg) once weekly. **Note:** Do not administer more frequently than once weekly.

Administration: OtherSubQ: Rotate injection sites (thigh, abdomen, upper arm); injections should never be made at sites that are bruised, red, tender, or hard

StorageStore powder in refrigerator at 2°C to 8°C (36°F to 46°F); do not freeze. Do not shake. Protect from light. After reconstitution, may be stored at controlled room temperature. Protect from light. Use within 3 hours of reconstitution.

ReconstitutionReconstitute rilonacept 220 mg powder for injection with SWFI 2.3 mL; do not use bacteriostatic water containing benzyl alcohol or parabens. After reconstituting with SWFI, gently shake the vial for 1 minute, then allow solution to sit for 1 minute. Each reconstituted vial allows for withdrawal of 2 mL (160 mg) for SubQ administration.

ContraindicationsThere are no contraindications listed in the manufacturer's labeling.

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: May cause rare hypersensitivity, anaphylaxis, or anaphylactoid reactions; medications for the treatment of hypersensitivity reactions should be available for immediate use.
- Infections: Caution should be exercised when considering use in patients with a history of new/recurrent infections, with conditions that predispose them to infections, or with latent or localized infections. Patients who develop a new infection while undergoing treatment should be monitored closely. If a patient develops a serious infection, therapy should be discontinued. Therapy should not be initiated in patients with active or chronic infections.
- Malignancy: Use may impair defenses against malignancies; impact on the development and course of malignancies is not fully defined.

Disease-related concerns:

- Hyperlipidemia: Use may increase total cholesterol, HDL, LDL, and triglycerides. Periodic assessment of lipid profile should occur. Initiation of lipid-lowering therapy may be necessary.

Concurrent drug therapy issues:

- Tumor necrosis factor (TNF)-blocking agents: Should not be used in combination with TNF-antagonists (eg, etanercept). There is an increased risk of serious infection.

Special populations:

- Elderly: Use caution due to the potential higher risk for infections.
- Pediatrics: Safety and efficacy has not been established in patients <12 years of age.

Other warnings/precautions:

- Immunizations: Patients should be brought up to date with all immunizations including pneumococcal and influenza vaccines before initiating therapy. Live vaccines should not be given concurrently; there is no data available concerning secondary transmission of live vaccines in patients receiving therapy. Administration of inactivated (killed) vaccines while on therapy may not be effective.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have demonstrated teratogenic effects and fetal loss. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if potential benefit to the mother outweighs potential risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is unknown whether or not rilonacept is excreted in human breast milk. Use with caution in breast-feeding.

Adverse Reactions

>10%:

Local: Injection site reactions (48%; majority mild-moderate; typically lasting 1-2 days; characterized by erythema, bruising, dermatitis, inflammation, pain, pruritus, swelling, urticaria, vesicles, warmth, and hemorrhage)

Respiratory: Upper respiratory tract infection (26%)

Miscellaneous: Infection (48% during winter months; 18% during summer months), antibody formation to rilonacept (35%)

1% to 10%:

Central nervous system: Hypoesthesia (9%)

Respiratory: Cough (9%), sinusitis (9%)

<1%, postmarketing, and/or case reports: HDL cholesterol increased, LDL cholesterol increased, neutropenia (transient), triglycerides increased, total cholesterol increased

Drug Interactions

Anti-TNF Agents: May enhance the adverse/toxic effect of Rilonacept. *Risk X: Avoid combination*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersCBC with differential, lipid profile, C-reactive protein (CRP), serum amyloid A; signs of infection

Nursing: Physical Assessment/MonitoringMonitor therapeutic response and adverse reactions at the beginning and periodically throughout therapy. Evaluate for signs and symptoms of infection. This drug should not be used when active or chronic infections are present. Immunization should be given prior to initiating therapy. Teach patient proper use, including appropriate injection techniques and syringe/needle disposal, possible side effects, and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, lipid profile, C-reactive protein (CRP), serum amyloid A

Patient EducationInform prescriber of all prescription or OTC medications or herbal products you are taking. You may experience a reaction (redness, swelling, pain, itching, or swelling) at the site of injection. This typically lasts 1-2 days. Do not receive any immunizations unless approved by prescriber. You may be susceptible to infections; avoid crowds and exposure to infections. Report signs of infection immediately. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Arcalyst™: 220 mg

Generic AvailableNo

ManufacturerRegeneron Pharmaceuticals, Inc

Mechanism of ActionCryopyrin-associated periodic syndromes (CAPS) refers to rare genetic syndromes caused by mutations in the nucleotide-binding domain, leucine rich family (NLR), pyrin domain containing 3 (NLRP-3) gene or the cold-induced autoinflammatory syndrome-1 (CIAS1) gene. Cryopyrin, a protein encoded by this gene, regulates interleukin-1 beta (IL-1β) activation. Deficiency of cryopyrin results in excessive inflammation. Rilonacept reduces inflammation by binding to IL-1β (some binding of IL-1α and IL-1 receptor antagonist) and preventing interaction with cell surface receptors.

Pharmacodynamics/KineticsOnset of action: Steady state reached by 6 weeks

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause changes in lipid profile; combined use with antipsychotic agents may produce additve effects; monitor

Riluzole

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(RIL yoo zole)
U.S. Brand NamesRilutek®
Canadian Brand NamesRilutek®
Pharmacologic CategoryGlutamate Inhibitor
Use: Labeled IndicationsTreatment of amyotrophic lateral sclerosis (ALS); riluzole can extend survival or time to tracheostomy
Dosing: Adults

ALS treatment: Oral: 50 mg every 12 hours; no increased benefit can be expected from higher daily doses, but adverse events are increased.

Dosage adjustment in smoking: Cigarette smoking is known to induce CYP1A2; patients who smoke cigarettes would be expected to eliminate riluzole faster. There is no information, however, on the effect of, or need for, dosage adjustment in these patients.

Dosage adjustment in special populations: Females and Japanese patients may possess a lower metabolic capacity to eliminate riluzole compared with male and Caucasian subjects, respectively.

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentUse with caution in patients with concomitant renal insufficiency.
Dosing: Hepatic ImpairmentUse with caution in patients with current evidence or history of abnormal liver function indicated by significant abnormalities in serum transaminase, bilirubin or GGT levels. Baseline elevations of several LFTs (especially elevated bilirubin) should preclude use of riluzole.
Administration: OralAdminister at the same time each day, 1 hour before or 2 hours after a meal.
Dietary ConsiderationsTake at least 1 hour before, or 2 hours after, a meal.
StorageStore at 20°C to 25°C (68°F to 77°F). Protect from bright light.
ContraindicationsSevere hypersensitivity reactions to riluzole or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause dizziness or somnolence; caution should be used performing tasks which require alertness (operating machinery or driving).
- Neutropenia: Among 4000 patients given riluzole for ALS, there were 3 cases of marked neutropenia (ANC <500/mm^3), all seen within the first 2 months of treatment.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; do not administer if baseline liver function tests are elevated. May cause elevations in transaminases (usually transient); discontinue if jaundice develops.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Elderly: Use with caution in the elderly; clearance decreased.
- Females: Use with caution in females; clearance decreased.
- Japanese patients: Use with caution in Japanese patients; clearance decreased.
- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsIn clinical trials, no difference was demonstrated between elderly and younger adults. However, renal and hepatic changes with age can be expected to result in higher serum concentrations of the parent drug and its metabolites.
Pregnancy Risk FactorC
Pregnancy ConsiderationsImpaired fertility, decreased implantation, increased intrauterine death, and adverse effects on offspring growth and viability were observed in animal studies. There are no adequate or well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

>10%:

Gastrointestinal: Nausea (12% to 21%)

Neuromuscular & skeletal: Weakness (15% to 20%)

Respiratory: Lung function decreased (10% to 16%)

1% to 10%:

Cardiovascular: Edema, hypertension, tachycardia

Central nervous system: Agitation, circumoral paresthesia, depression, dizziness, headache, insomnia, malaise, somnolence, tremor, vertigo

Dermatologic: Alopecia, eczema, pruritus

Gastrointestinal: Abdominal pain, anorexia, diarrhea, dyspepsia, flatulence, oral moniliasis, stomatitis, vomiting

Hepatic: Liver function tests increased

Neuromuscular & skeletal: Arthralgia, back pain

Respiratory: Cough increased, rhinitis, sinusitis

Miscellaneous: Aggravation reaction

<1% (Limited to important or life-threatening): Exfoliative dermatitis, neutropenia, postural hypertension, seizure

Metabolism/Transport Effects**Substrate** of CYP1A2 (major)
Drug Interactions

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (due to CNS depression and possible risk of liver toxicity).

Food: A high-fat meal decreases absorption of riluzole (decreasing AUC by 20% and peak blood levels by 45%). Charbroiled food may increase riluzole elimination.

Monitoring ParametersMonitor serum aminotransferases including ALT levels before and during therapy. Evaluate serum ALT levels every month during the first 3 months of therapy, every 3 months during the remainder of the first year and periodically thereafter. Evaluate ALT levels more frequently in patients who develop elevations. Maximum increases in serum ALT usually occurred within 3 months after the start of therapy and were usually transient when <5 times ULN (upper limits of normal).

In trials, if ALT levels were <5 times ULN, treatment continued and ALT levels usually returned to below 2 times ULN within 2-6 months. There is no experience with continued treatment of ALS patients once ALT values exceed 5 times ULN.

If a decision is made to continue treatment in patients when the ALT exceeds 5 times ULN, frequent monitoring (at least weekly) of complete liver function is recommended. Discontinue treatment if ALT exceeds 10 times ULN or if clinical jaundice develops. Monitor temperature, especially during first 2 months of therapy.

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions (decreased liver function) at beginning of therapy and periodically throughout therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Monitoring: Lab TestsMonitor serum aminotransferases (including ALT levels) before and during therapy. Evaluate serum ALT levels every month during the first 3 months of therapy, every 3 months during the remainder of the first year, and periodically thereafter. Evaluate ALT levels more frequently in patients who develop elevations. Maximum increases in serum ALT usually occurred within 3 months after the start of therapy and were usually transient when <5 times ULN.

In trials, if ALT levels were <5 times ULN, treatment continued and ALT levels usually returned to below 2 times ULN within 2-6 months. Treatment in studies was discontinued, however, if ALT levels exceed 5 times ULN, so that there is no experience with continued treatment of ALS patients once ALT values exceed 5 times ULN.

If a decision is made to continue treatment in patients when the ALT exceeds 5 times ULN, frequent monitoring (at least weekly) of complete liver function is recommended. Discontinue treatment if ALT exceeds 10 times ULN or if clinical jaundice develops.

Patient EducationThis drug will not cure or stop disease but it may slow progression. Take as directed, at the same time each day, preferably on an empty stomach, 1 hour before or 2 hours after meals. Avoid alcohol. You may experience increased spasticity, dizziness or sleepiness; use caution when driving or engaging in tasks requiring alertness until response to drug is known. Small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may reduce nausea, vomiting, or anorexia. Report fever; severe vomiting, diarrhea, or constipation; change in color of urine or stool; yellowing of skin or eyes; acute back pain or muscle pain; or worsening of condition.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 50 mg

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Tablets (Rilutek)

50 mg (60): $882.92

Mechanism of ActionMechanism of action is not known. Pharmacologic properties include inhibitory effect on glutamate release, inactivation of voltage-dependent sodium channels; and ability to interfere with intracellular events that follow transmitter binding at excitatory amino acid receptors

Pharmacodynamics/Kinetics

Absorption: 90%; high-fat meal decreases AUC by 20% and peak blood levels by 45%

Protein binding, plasma: 96%, primarily to albumin and lipoproteins

Metabolism: Extensively hepatic to six major and a number of minor metabolites via CYP1A2 dependent hydroxylation and glucuronidation

Bioavailability: Oral: Absolute: 60%

Half-life elimination: 12 hours

Excretion: Urine (90%; 85% as metabolites, 2% as unchanged drug) and feces (5%) within 7 days

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Oral moniliasis and stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause agitation, depression, dizziness, insomnia, malaise, or somnolence

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine. GI side effects are common; concomitant use with SSRIs, carbamazepine, valproic acid, and lithium may produce additive effects. Riluzole is a CYP1A2 substrate; cigarette smoking may increase metabolism of riluzole.

Anesthesia and Critical Care Concerns/Other ConsiderationsRiluzole may be more effective for amyotrophic lateral sclerosis of bulbar onset.

Index Terms2-Amino-6-Trifluoromethoxy-benzothiazole; RP-54274

Special Alerts

CDC Interim Recommendations Concerning Use of Antivirals During 2008-09 Influenza Season - December 2008

The Centers for Disease Control (CDC) has issued a Health Advisory with interim recommendations for chemoprophylaxis or influenza treatment with the following antiviral agents: Oseltamivir (Tamiflu®), zanamivir (Relenza®), rimantadine (Flumadine®), amantadine (Symmetrel®).

The recommendations were prompted by preliminary data in a limited number of states indicating a high prevalence of the oseltamivir-resistant influenza A (H1N1) strain. Influenza activity remains low at the present time, but of the 50 H1N1 isolates from 12 states tested between October 1 and December 19, 2008, 49 (98%) were resistant to oseltamivir. The CDC is unable to make any accurate predictions of which influenza virus types (A or B) or subtypes of influenza A (H1N1 or H3N2) will predominate during the 2008-09 season, but based on the current findings, the following recommendations have been made:

- Patients testing positive for influenza type B: If treatment is indicated, patients may receive either oseltamivir or zanamivir (no preference).

- Patients testing positive for influenza type A (or patients testing negative for influenza, but likelihood of influenza infection is high): If treatment is indicated, patient may receive zanamivir. If zanamivir therapy is inappropriate (eg, patients with chronic respiratory disease, patients <7 years of age) or zanamivir is unavailable, combination treatment with oseltamivir and rimantadine is acceptable (if rimantadine is unavailable, amantadine may be substituted). Oseltamivir monotherapy should only be used if local surveillance indicates that influenza A (H3N2) or influenza type B viruses are likely.

- If confirmatory diagnostic testing to distinguish between subtypes of influenza A (H1N1 or H3N2) is available, and treatment is indicated:

  Patients testing positive for influenza A (H3N2): Use oseltamivir or zanamivir (no preference)

  Patients testing positive for influenza A (H1N1): Use zanamivir (or combination treatment with oseltamivir and rimantadine as an alternative)

Patients requiring chemoprophylaxis due to potential exposure with laboratory-confirmed influenza A (H3N2) or influenza B should receive oseltamivir or zanamivir. Patients requiring chemoprophylaxis due to influenza A (H1N1) virus should receive zanamivir (or rimantadine, if zanamivir use contraindicated).

The CDC is reminding clinicians to continue to vaccinate patients using the influenza vaccine, which is expected to be effective against all circulating influenza vaccines, including the oseltamivir-resistant strain.

For additional information, including the CDC Health Advisory, please refer to http://www2a.cdc.gov/HAN/ArchiveSys/ViewMsgV.asp?AlertNum=00279

Rimantadine ACIP 2008-2009 Influenza Guidelines (July 2008)

The Advisory Committee on Immunization Practices (ACIP), as part of their recommendations for the Prevention and Control of Influenza, do not recommend the use of amantadine or rimantadine for the treatment or chemoprophylaxis of influenza A infection. This recommendation is for the 2008-2009 season for residents of the United States and is based on current patterns of resistance to these medications. Oseltamivir or zanamivir are the recommended antiviral agents. In some areas, resistance is developing against oseltamivir. If resistance is suspected, amantadine or rimantadine may be used in combination with oseltamivir for the treatment or prophylaxis of influenza A infection when zanamivir therapy is not indicated (such as in children of certain ages).

For additional information, refer to the ACIP guidelines on the following CDC website:
http://www.cdc.gov/mmwr/preview/mmwrhtml/rr57e717a1.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Rimantadine may be confused with amantadine, ranitidine, Rimactane®

Flumadine® may be confused with fludarabine, flunisolide, flutamide

Pronunciation(ri MAN ta deen)

U.S. Brand NamesFlumadine®

Canadian Brand NamesFlumadine®

Pharmacologic CategoryAntiviral Agent, Adamantane

Use: Labeled IndicationsProphylaxis (adults and children >1 year of age) and treatment (adults) of influenza A viral infection (per manufacturer labeling; also refer to current ACIP guidelines for recommendations during current flu season)

Note: In certain circumstances, the ACIP recommends use of rimantadine in combination with oseltamivir for the treatment or prophylaxis of influenza A infection when resistance to oseltamivir is suspected.

Dosing: Adults

Prophylaxis of influenza A: Oral: 100 mg twice daily

Treatment of influenza A: Oral: 100 mg twice daily

Dosing: Elderly

Prophylaxis of influenza A: Oral: 100 mg/day in nursing home patients or all elderly patients who may experience adverse effects using the adult dose

Treatment of influenza A: Oral: 100 mg once daily in patients ≥65 years

Dosing: Pediatric**Prophylaxis of influenza A:** Oral:

Children 1-10 years: 5 mg/kg once daily; maximum: 150 mg

Children >10 years: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} >10 mL/minute: Dose adjustment not required

Cl_{cr} ≤10 mL/minute: 100 mg/day

Dosing: Hepatic Impairment Severe dysfunction: 100 mg/day

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralInitiation of rimantadine within 48 hours of the onset of influenza A illness halves the duration of illness and significantly reduces the duration of viral shedding and increased peripheral airways resistance. Continue therapy for 5-7 days after symptoms begin.

StorageStore at 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to drugs of the adamantine class, including rimantadine and amantadine, or any component of the formulation

Allergy Considerations

- Adamantane Derivative Allergy

Warnings/Precautions

Disease-related concerns:

- Eczema: Avoid use, if possible, in patients with recurrent and eczematoid dermatitis.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Influenza A: Appropriate use: Consult current guidelines. Due to increased resistance, the ACIP has recommended that rimantadine and amantadine no longer be used for the treatment or prophylaxis of influenza A in the United States until susceptibility has been re-established.

- Psychosis: Avoid use, if possible, in patients with uncontrolled psychosis or severe psychoneurosis.

- Renal impairment: Use with caution in patients with renal impairment.

- Seizures: Use with caution in patients with a history of seizure disorder; an increase in seizure incidence may occur. Discontinue if seizures occur.

Other warnings/precautions:

- Resistance: May develop during treatment; viruses exhibit cross-resistance between amantadine and rimantadine.

Geriatric ConsiderationsAdverse CNS and GI effects occur frequently if dosage is not adjusted. Monitor GI effects in the elderly or patients with renal or hepatic impairment. Dosing must be individualized (100 mg 1-2 times/day). It is recommended that nursing home patients receive 100 mg/day.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal data suggest embryotoxicity, maternal toxicity, and offspring mortality at doses 7-11 times the recommended human dose. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/ not recommended

Breast-Feeding ConsiderationsDo not use in nursing mothers due to potential adverse effect in infants.

Adverse Reactions

1% to 10%:

Central nervous system: Dizziness (1% to 2%), insomnia (2% to 3%), concentration impaired (2%), anxiety (1%), fatigue (1%), headache (1%), nervousness (1% to 2%)

Gastrointestinal: Nausea (3%), anorexia (2%), vomiting (2%), xerostomia (2%), abdominal pain (1%)

Neuromuscular & skeletal: Weakness (1%)

<1%: Agitation, ataxia, bronchospasm, cardiac failure, concentration impaired, confusion, convulsions, cough, depression, diarrhea, dyspepsia, dyspnea, euphoria, gait abnormality, hallucinations, heart block, hyperkinesias, hypertension, lactation, palpitation, pallor, parosmia, pedal edema, rash, somnolence, syncope, tachycardia, taste alteration, tinnitus, tremor

Drug Interactions

Influenza Virus Vaccine: Antiviral Agents (Influenza A and B) may diminish the therapeutic effect of Influenza Virus Vaccine. This only pertains to live, attentuated influenza virus vaccine. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Food does not affect rate or extent of absorption

Monitoring ParametersMonitor for CNS or GI effects in elderly or patients with renal or hepatic impairment

Nursing: Physical Assessment/MonitoringUse caution with hepatic or renal impairment, seizure disorders, uncontrolled psychoses, or severe psychoneurosis. Assess effectiveness (resolution of infection) and adverse reactions (eg, hypotension, CNS changes [confusion, anxiety, agitation], gastrointestinal upset, anticholinergic effects [dry mouth, urinary retention, mydriases]). Teach patient appropriate use, possible side effects/interventions (eg, postural hypotension), and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed. Complete full course of therapy even if feeling better. Take a missed dose as soon as possible. If almost time for next dose, skip the missed dose and return to your regular schedule. Do not take a double dose. May cause dizziness, insomnia, fatigue, nervousness (use caution when driving or engaged in potentially hazardous tasks until response to medication is known); gastrointestinal upset (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report rash, palpitations; severe nausea or vomiting; persistent CNS changes (eg, confusion, insomnia, anxiety, restlessness, irritability, hallucinations) or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Syrup, as hydrochloride:

Flumadine®: 50 mg/5 mL (240 mL) [raspberry flavor] [DSC]

Tablet, as hydrochloride: 100 mg

Flumadine®: 100 mg

Generic AvailableYes: Tablet

ManufacturerForest Pharmaceuticals, Inc

Pricing: U.S. (www.drugstore.com)

Syrup (Flumadine)

50 mg/5 mL (240): $55.99

Tablets (Flumadine)

100 mg (14): $43.99

Mechanism of ActionExerts its inhibitory effect on three antigenic subtypes of influenza A virus (H1N1, H2N2, H3N2) early in the viral replicative cycle, possibly inhibiting the uncoating process; it has no activity against influenza B virus and is two- to eightfold more active than amantadine

Pharmacodynamics/Kinetics

Onset of action: Antiviral activity: No data exist establishing a correlation between plasma concentration and antiviral effect

Absorption: Tablet and syrup formulations are equally absorbed

Metabolism: Extensively hepatic

Half-life elimination: 25.4 hours; prolonged in elderly

Time to peak: 6 hours

Excretion: Urine (<25% as unchanged drug)

Clearance: Hemodialysis does not contribute to clearance

Related Information

Medication Safety Issues

Sound-alike/look-alike issues:

Vexol® may be confused with VoSol®

Pronunciation(ri MEKS oh lone)
U.S. Brand NamesVexol®
Canadian Brand NamesVexol®
Pharmacologic CategoryCorticosteroid, Ophthalmic
Use: Labeled IndicationsTreatment of inflammation after ocular surgery and the treatment of anterior uveitis
Dosing: Adults**Anti-inflammatory:** Ophthalmic: Instill 1 drop in conjunctival sac 2-4 times/day up to every 4 hours; may use every 1-2 hours during first 1-2 days
Dosing: ElderlyRefer to adult dosing.
ContraindicationsHypersensitivity to rimexolone or any component of the formulation; fungal, viral, or untreated pus-forming bacterial ocular infections
Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Infection: Steroids may mask infection or enhance existing ocular infection; prolonged use may result in secondary infections due to immunosuppression.

- Ocular effects: Prolonged use may result in glaucoma and injury to the optic nerve. Visual defects in acuity and field of vision may occur. Posterior subcapsular cataracts may form after long-term use. Use with caution in presence of glaucoma (steroids increase intraocular pressure). Perforation may occur with topical steroids in diseases which thin the cornea or sclera. Steroid use may delay healing after cataract surgery. Intraocular pressure should be monitored if this product is used >10 days.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo special considerations; must limit the time steroids are used to prevent adverse effects.
Pregnancy Risk FactorC
Adverse Reactions

1% to 10%: Ocular: Temporary mild blurred vision

<1%: Stinging, burning eyes, corneal thinning, increased intraocular pressure, glaucoma, damage to the optic nerve, defects in visual activity, cataracts, secondary ocular infection

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Monitoring ParametersIntraocular pressure and periodic examination of lens (with prolonged use)
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, ophthalmic: 1% (5 mL, 10 mL) [contains benzalkonium chloride]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Suspension (Vexol)

1% (5): $39.99

1% (10): $67.17

Mechanism of ActionDecreases inflammation by suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability
Pharmacodynamics/Kinetics

Absorption: Through aqueous humor

Metabolism: Hepatic for any amount of drug absorbed

Excretion: Urine and feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Special Alerts

Bisphosphonates: Safety Update Regarding Possible Association With Atrial Fibrillation - November 2008

The Food and Drug Administration (FDA) has been reviewing placebo-controlled trials of the 7 bisphosphonates currently marketed in the US. This review is in response to study results associating an increased incidence of atrial fibrillation (AF) with alendronate or zoledronic acid use in women (65-89 years of age) with osteoporosis.

The FDA reviewed all the submitted data (19,687 bisphosphonate-treated patients and 18,358 placebo-treated patients) from these studies. Overall, the occurrence of AF was rare in each study with an absolute difference in event rates between each of the bisphosphonate and placebo arms of 0-3 per 1000. A zoledronic acid study showed a statistically significant increase in the rate of AF in the active treatment arm. However, no clear association between bisphosphonate use and AF could be established. In this study, AF events were diagnosed more than 30 days after receiving zoledronic acid in 47 of the 50 patients diagnosed with AF. According to the FDA, healthcare providers should not alter their prescribing patterns for bisphosphonates and patients should not stop taking their medication.

The FDA will continue monitoring the safety of bisphosphonates through postmarketing reports and is assessing the need for additional epidemiologic studies.

Further information is available at http://www.fda.gov/cder/drug/early_comm/bisphosphonates_update_200811.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Actonel® may be confused with Actos®

Pronunciation(ris ED roe nate & KAL see um)
U.S. Brand NamesActonel® and Calcium
Pharmacologic CategoryBisphosphonate Derivative; Calcium Salt
Use: Labeled IndicationsTreatment and prevention of osteoporosis in postmenopausal women
Dosing: Adults**Osteoporosis in postmenopausal females:** Oral:

Risedronate: 35 mg once weekly on day 1 of 7-day treatment cycle

Calcium carbonate: 1250 mg (elemental calcium 500 mg) once daily on days 2 through 7 of 7-day treatment cycle

Dosing: Elderly

Refer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} <30 mL/minute: Not recommended for use.
Calculations

- Creatinine Clearance: Adults

Administration: OralRisedronate should be administered ≥30 minutes before the first food or drink of the day other than water. Risedronate should be taken in an upright position with a full glass (6-8 oz) of plain water and the patient should avoid lying down for 30 minutes to minimize the possibility of GI side effects. Calcium should be taken with food. If additional calcium is needed (other than what is provided in blister package), it should be taken at a separate time of the day.
Dietary ConsiderationsTake risedronate ≥30 minutes before the first food or drink of the day other than water. Calcium should be taken with food. Vitamin D supplementation may be needed.
StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to risedronate, bisphosphonates, or any component of the formulation; hypocalcemia, hypercalcemia; abnormalities of the esophagus which delay esophageal emptying (eg, stricture or achalasia); inability to stand or sit upright for at least 30 minutes; severe renal impairment (Cl_{cr} <30 mL/minute)
Warnings/Precautions

Concerns related to adverse effects:

- Bone/joint/muscle pain: Infrequently, severe (and occasionally debilitating) bone, joint, and/or muscle pain have been reported during bisphosphonate treatment. The onset of pain ranged from a single day to several months. Symptoms usually resolve upon discontinuation. Some patients experienced recurrence when rechallenged with same drug or another bisphosphonate; avoid use in patients with a history of these symptoms in association with bisphosphonate therapy.

- Gastrointestinal mucosa irritation: May cause irritation to upper gastrointestinal mucosa. Esophagitis, esophageal ulcers, esophageal erosions, and esophageal stricture (rare) have been reported with oral bisphosphonates; risk increases in patients unable to comply with dosing instructions. Use with caution in patients with dysphagia, esophageal disease, gastritis, duodenitis, or ulcers (may worsen underlying condition).

- Osteonecrosis of the jaw: Bisphosphonate therapy has been associated with osteonecrosis, primarily of the jaw; this has been observed mostly in cancer patients, but also in patients with postmenopausal osteoporosis and other diagnoses. Risk factors include a diagnosis of cancer, with concomitant chemotherapy, radiotherapy, or corticosteroids; anemia, coagulopathy, infection, or pre-existing dental disease. Symptoms included nonhealing extraction socket or an exposed jawbone. There are no data addressing whether discontinuation of therapy reduces the risk of developing osteonecrosis; however, as a precautionary measure, dental exams and preventative dentistry should be performed prior to placing patients with risk factors on chronic bisphosphonate therapy. Invasive dental procedures should be avoided during treatment.

Disease-related concerns:

- Hypocalcemia: Before therapy initiation hypocalcemia must be corrected; ensure adequate vitamin D intake.

- Renal impairment: Use with caution in patients with renal impairment (not recommended in patients with a Cl_{cr} <30 mL/minute). Calcium should be used with caution in patients with a history of kidney stones or hypercalciuria.

Special populations:

- Males: Safety and efficacy of using the combination for the treatment of primary osteoporosis as packaged have not been established in men.

- Pediatrics: Safety and efficacy of using the combination as packaged have not been established in children.

Other warnings/precautions:

- Absorption: Calcium carbonate absorption is impaired in achlorhydria (common in elderly); administer calcium component with food.

Geriatric ConsiderationsSee individual agents.
Pregnancy Risk FactorC
Pregnancy ConsiderationsSee individual agents.
LactationExcretion of risedronate in breast milk is unknown/not recommended
Breast-Feeding ConsiderationsSee individual agents.
Adverse ReactionsSee individual agents.
Drug Interactions

Aminoglycosides: May enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Bisphosphonate Derivatives. Antacids containing aluminum, calcium, or magnesium are of specific concern. **Exceptions:** Magaldrate; Sodium Bicarbonate. *Risk D: Consider therapy modification*

Calcium Salts: May decrease the absorption of Bisphosphonate Derivatives. *Risk D: Consider therapy modification*

Iron Salts: May decrease the absorption of Bisphosphonate Derivatives. Only oral iron salts are of concern. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Phosphate Supplements: Bisphosphonate Derivatives may enhance the hypocalcemic effect of Phosphate Supplements. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase risk of osteoporosis).

Food:

Risedronate: Food may reduce absorption (similar to other bisphosphonates); mean oral bioavailability is decreased when given with food.

Calcium: Food increases absorption. Calcium may decrease iron absorption. Bran, foods high in oxalates, or whole grain cereals may decrease calcium absorption

Test InteractionsBisphosphonates may interfere with diagnostic imaging agents such as technetium-99m-diphosphonate in bone scans.
Monitoring ParametersPain and fracture rate, bone mineral density, height
Reference RangeCalcium (total): Adults: 9.0-11.0 mg/dL (2.05-2.54 mmol/L), may slightly decrease with aging; phosphorus: 2.5-4.5 mg/dL (0.81-1.45 mmol/L)
Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Combination package [each package contains]:

Tablet (Actonel®): Risedronate 35 mg (4s)

Tablet: Calcium carbonate 1250 mg (24s) [equivalent to elemental calcium 500 mg]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Actonel With Calcium)

35-1250 mg (28): $105.11

Mechanism of Action

Risedronate inhibits bone resorption via actions on osteoclasts or on osteoclast precursors; decreases the rate of bone resorption, leading to an indirect increase in bone mineral density.

Calcium helps to prevent or decrease the rate of bone loss.

Pharmacodynamics/KineticsSee individual agents.

Dental Health Professional ConsiderationsSee Risedronate monograph.

Dental Health: Effects on Dental TreatmentOsteonecrosis of the jaw (ONJ), generally associated with local infection and/or tooth extraction and often with delayed healing, has been reported in patients taking bisphosphonates. Symptoms included nonhealing extraction socket or an exposed jawbone. Most reported cases of bisphosphonate-associated osteonecrosis have been in cancer patients treated with intravenous bisphosphonates. However, some have occurred in patients with postmenopausal osteoporosis taking oral bisphosphonates. Dental surgery may exacerbate ONJ. For patients requiring dental procedures, there are no data available to suggest whether discontinuation of bisphosphonate treatment reduces the risk of ONJ. Patients who develop ONJ while on bisphosphonate therapy should receive care by an oral surgeon. See Dental Comment in Risedronate monograph.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause depression, insomnia, anxiety, and dizziness

Mental Health: Effects on Psychiatric TreatmentNausea and diarrhea are common; concomitant use with SSRIs, lithium, valproic acid, or carbamazepine may produce additive effects

Index TermsCalcium and Risedronate; Risedronate Sodium and Calcium Carbonate

Bisphosphonates: Safety Update Regarding Possible Association With Atrial Fibrillation - November 2008

The Food and Drug Administration (FDA) has been reviewing placebo-controlled trials of the 7 bisphosphonates currently marketed in the US. This review is in response to study results associating an increased incidence of atrial fibrillation (AF) with alendronate or zoledronic acid use in women (65-89 years of age) with osteoporosis.

The FDA reviewed all the submitted data (19,687 bisphosphonate-treated patients and 18,358 placebo-treated patients) from these studies. Overall, the occurrence of AF was rare in each study with an absolute difference in event rates between each of the bisphosphonate and placebo arms of 0-3 per 1000. A zoledronic acid study showed a statistically significant increase in the rate of AF in the active treatment arm. However, no clear association between bisphosphonate use and AF could be established. In this study, AF events were diagnosed more than 30 days after receiving zoledronic acid in 47 of the 50 patients diagnosed with AF. According to the FDA, healthcare providers should not alter their prescribing patterns for bisphosphonates and patients should not stop taking their medication.

The FDA will continue monitoring the safety of bisphosphonates through postmarketing reports and is assessing the need for additional epidemiologic studies.

Further information is available at http://www.fda.gov/cder/drug/early_comm/bisphosphonates_update_200811.htm

Medication Safety Issues

Sound-alike/look-alike issues:

> Actonel® may be confused with Actos®

Pronunciation(ris ED roe nate)

U.S. Brand NamesActonel®

Canadian Brand NamesActonel®

Pharmacologic CategoryBisphosphonate Derivative

Use: Labeled IndicationsTreatment of Paget's disease of the bone; treatment and prevention of glucocorticoid-induced osteoporosis; treatment and prevention of osteoporosis in postmenopausal women; treatment of osteoporosis in men

Dosing: Adults

Paget's disease of bone: Oral: 30 mg once daily for 2 months

> **Note:** Retreatment may be considered (following post-treatment observation of at least 2 months) if relapse occurs, or if treatment fails to normalize serum alkaline phosphatase. For retreatment, the dose and duration of therapy are the same as for initial treatment. No data are available on more than one course of retreatment.

Osteoporosis (postmenopausal) prevention and treatment: Oral: 5 mg once daily **or** 35 mg once weekly **or** one 75 mg tablet taken on 2 consecutive days once a month (total of 2 tablets/month) **or** 150 mg once a month

Osteoporosis (male) treatment: 35 mg once weekly

Osteoporosis (glucocorticoid-induced) prevention and treatment: Oral: 5 mg once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} ≥30 mL/minute: No adjustment required

Cl_{cr} <30 mL/minute: Use is not recommended

Calculations

- Creatinine Clearance: Adults

Administration: OralRisedronate should be administered at least 30 or more minutes before the first food or drink of the day other than water. Risedronate should be taken in an upright position with a full glass (6-8 oz) of plain water and the patient should avoid lying down for 30 minutes to minimize the possibility of GI side effects. Tablet should be swallowed whole; do not crush or chew.

Dietary ConsiderationsTake ≥30 minutes before the first food or drink of the day other than water. Supplemental calcium and/or vitamin D may be required if dietary intake is not adequate.

StorageStore at room temperature of 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to risedronate, bisphosphonates, or any component of the formulation; hypocalcemia; inability to stand or sit upright for at least 30 minutes

Allergy Considerations

- Bisphosphonate Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bone/joint/muscle pain: Infrequently, severe (and occasionally debilitating) bone, joint, and/or muscle pain have been reported during bisphosphonate treatment. The onset of pain ranged from a single day to several months. Symptoms usually resolve upon discontinuation. Some patients experienced recurrence when rechallenged with same drug or another bisphosphonate; avoid use in patients with a history of these symptoms in association with bisphosphonate therapy.

- Gastrointestinal mucosa irritation: May cause irritation to upper gastrointestinal mucosa. Dysphagia, esophagitis, esophageal or gastric ulcers, esophageal erosions, and esophageal stricture (rare) have been reported with oral bisphosphonates; risk increases in patients unable to comply with dosing instructions. Use with caution in patients with dysphagia, esophageal disease, gastritis, duodenitis, or ulcers (may worsen underlying condition). Discontinue if new or worsening symptoms occur.

- Osteonecrosis of the jaw: Bisphosphonate therapy has been associated with osteonecrosis, primarily of the jaw; this has been observed mostly in cancer patients, but also in patients with postmenopausal osteoporosis and other diagnoses. Risk factors include a diagnosis of cancer, with concomitant chemotherapy, radiotherapy, or corticosteroids; anemia, coagulopathy, infection, or pre-existing dental disease. Symptoms included nonhealing extraction socket or an exposed jawbone. There are no data addressing whether discontinuation of therapy reduces the risk of developing osteonecrosis; however, as a precautionary measure, dental exams and preventative dentistry should be performed prior to placing patients with risk factors on chronic bisphosphonate therapy. Invasive dental procedures should be avoided during treatment.

Disease-related concerns:

- Glucocorticoid-induced osteoporosis: Evaluate sex steroid hormonal status prior to treatment initiation; consider appropriate hormone replacement if necessary.

- Hypocalcemia: Before initiation of therapy hypocalcemia must be corrected; ensure adequate calcium and vitamin D intake, especially for patients with Paget's disease in whom the pretreatment rate of bone turnover may be greatly elevated.

- Renal impairment: Use with caution in patients with renal impairment (not recommended in patients with a Cl_{cr} <30 mL/minute).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo dosage adjustment required if Cl_{cr} ≥30 mL/minute. Since elderly often receive diuretics, evaluate electrolyte status periodically due to the drug class (bisphosphonates). Should assure that immobile patients are sitting up for at least 30 minutes after swallowing tablets.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic and nonteratogenic embryo/fetal effects have been reported in animal studies. There are no adequate and well-controlled studies in pregnant women. Bisphosphonates are incorporated into the bone matrix and gradually released over time. Theoretically, there may be a risk of fetal harm when pregnancy follows the completion of therapy. Based on limited case reports with pamidronate, serum calcium levels in the newborn may be altered if administered during pregnancy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsThe manufacturer recommends discontinuing nursing or discontinuing risedronate.

Adverse ReactionsFrequency may vary with dose and indication.

>10%:

Cardiovascular: Hypertension (11%)

Central nervous system: Headache (10% to 18%)

Dermatologic: Rash (8% to 12%)

Endocrine & metabolic: Serum PTH levels decreased (<30%)

Gastrointestinal: Diarrhea (5% to 20%), constipation (7% to 13%), nausea (7% to 13%), abdominal pain (7% to 12%), dyspepsia (7% to 11%)

Genitourinary: Urinary tract infection (11%)

Neuromuscular & skeletal: Arthralgia (12% to 33%), back pain (18% to 28%)

Miscellaneous: Infection (≤31%)

1% to 10%:

Cardiovascular: Peripheral edema (8%), chest pain (5% to 7%), arrhythmia (2%)

Central nervous system: Depression (7%), dizziness (7%), insomnia (5%)

Endocrine & metabolic: Hypocalcemia (≤5%), hypophosphatemia (<3%)

Gastrointestinal: Gastritis (3%), duodenitis (≤1%), glossitis (≤1%)

Genitourinary: Prostatic hyperplasia (5%; benign), nephrolithiasis (3%)

Neuromuscular & skeletal: Joint disorder (7%), myalgia (5% to 7%), neck pain (5%), weakness (5%), neuralgia (4%)

Ocular: Cataract (7%), dry eyes (3%)

Respiratory: Bronchitis (3% to 10%), pharyngitis (6%), rhinitis (6%), dyspnea (4%)

Miscellaneous: Flu-like syndrome (10%), acute phase reaction (≤8%; includes fever, influenza-like illness)

<1%, postmarketing, and/or case reports: Allergic reaction, angioedema, arthritis, bullous skin reaction, cough, dysphagia, esophagitis, esophageal ulcer, gastric ulcer, hypersensitivity reaction, iritis, joint pain, liver function test abnormality, musculoskeletal pain (rarely severe or incapacitating), osteonecrosis (primarily of the jaw), sinusitis, uveitis

Drug Interactions

Aminoglycosides: May enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Bisphosphonate Derivatives. Antacids containing aluminum, calcium, or magnesium are of specific concern. **Exceptions:** Magaldrate; Sodium Bicarbonate. *Risk D: Consider therapy modification*

Calcium Salts: May decrease the absorption of Bisphosphonate Derivatives. *Risk D: Consider therapy modification*

Iron Salts: May decrease the absorption of Bisphosphonate Derivatives. Only oral iron salts are of concern. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Phosphate Supplements: Bisphosphonate Derivatives may enhance the hypocalcemic effect of Phosphate Supplements. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase risk of osteoporosis).

Food: Food reduces absorption (similar to other bisphosphonates); mean oral bioavailability is decreased when given with food.

Test InteractionsBisphosphonates may interfere with diagnostic imaging agents such as technetium-99m-diphosphonate in bone scans.
Monitoring ParametersAlkaline phosphatase should be periodically measured; serum calcium, phosphorus; monitor pain and fracture rate; bone mineral density

Evaluate sex steroid hormonal status prior to treatment initiation (when treating glucocorticoid-induced osteoporosis).

Reference RangeCalcium (total): Adults: 9.0-11.0 mg/dL (2.05-2.54 mmol/L), may slightly decrease with aging; phosphorus: 2.5-4.5 mg/dL (0.81-1.45 mmol/L)
Nursing: Physical Assessment/MonitoringAssess history for any previous adverse response to bisphosphonates and ability to comply with administration instructions. Use caution with renal impairment. Correct any hypocalcemia prior to beginning treatment. Patients at risk for osteonecrosis (eg, chemotherapy, corticosteroids, poor oral hygiene) should have dental exams and necessary preventive dentistry should be done before beginning bisphosphonate therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions or toxicity. Assess results of periodic laboratory tests, therapeutic effectiveness (eg, pain, fracture rate, bone density), and adverse reactions (eg, immediate or long-term musculoskeletal pain). Teach appropriate use and specific administration directions, lifestyle and dietary changes according to purpose for use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsAlkaline phosphatase should be periodically measured; serum calcium, phosphorus
Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take with a full glass of water on an empty stomach at least 30 minutes before eating or taking anything else. Stay in sitting or standing position for 30 minutes following administration and until after the first food of the day to reduce potential for esophageal irritation. Consult prescriber to determine necessity of dietary supplements of calcium or increased dietary vitamin D. Certain dental procedures should be avoided if possible while you are taking this medication; consult prescriber. You may experience temporary nausea or vomiting (small frequent meals may help); diarrhea (boiled milk or yogurt may help); or bone pain (consult prescriber for analgesic). Report persistent muscle or bone pain; leg cramps; muscle twitching; unusual fever; convulsions; difficulty breathing; rash; bloody stool; pain in mouth, jaws, or teeth; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or if you are breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as sodium:

Actonel®: 5 mg, 30 mg, 35 mg, 75 mg, 150 mg

Generic AvailableNo
ManufacturerProcter & Gamble Pharmaceuticals
Pricing: U.S. (www.drugstore.com)

Tablets (Actonel)

5 mg (30): $109.52

30 mg (10): $240.85

35 mg (4): $105.11

75 mg (2): $110.58

150 mg (1): $110.58

Mechanism of ActionA bisphosphonate which inhibits bone resorption via actions on osteoclasts or on osteoclast precursors; decreases the rate of bone resorption, leading to an indirect increase in bone mineral density. In Paget's disease, characterized by disordered resorption and formation of bone, inhibition of resorption leads to an indirect decrease in bone formation; but the newly-formed bone has a more normal architecture.

Pharmacodynamics/Kinetics

Onset of action: May require weeks

Absorption: Rapid

Distribution: V_d: 13.8 L/kg

Protein binding: ~24%

Metabolism: None

Bioavailability: Poor, ~0.54% to 0.75%

Half-life elimination: Initial: 1.5 hours; Terminal: 480-561 hours

Time to peak, serum: 1 hour

Excretion: Urine (up to 85%); feces (as unabsorbed drug)

Dental Health Professional ConsiderationsCases of oral bisphosphonate-associated ONJ have been reported. A report by the Council of Scientific Affairs of the American Dental Association (accessed at: http://www.ada.org/prof/resources/topics/osteonecrosis.asp) as of July 2006 gave an estimated incidence of 0.7 cases for every 100,000 person-years of exposure to alendronate (Fosamax®). This translates to one case for every 142,857 person-years exposure. This figure from the ADA report was based on information received from Merck & Co citing 170 worldwide cases for alendronate (Fosamax®). In addition, Procter & Gamble Pharmaceuticals has cited 20 cases for risedronate (Actonel®) and Roche Laboratories has cited one case for ibandronate (Boniva®).

Consumer Reports On Health stated that the risk of jaw bone osteoporosis due to alendronate (Fosamax®), risedronate (Actonel®), or ibandronate (Boniva®) taken to prevent osteoporosis is very low and is estimated to be one out of every 20,000 users. That report mentioned that tooth extraction or implants increase the risk of developing osteonecrosis in patients taking any of these drugs for osteoporosis. The report also recommended that patients should stop taking any of these oral drugs 1-2 months before and after such dental treatment. No evidence was presented to support this statement.

In terms of length of exposure to oral bisphosphonates prior to onset of ONJ, data from large population studies or controlled studies is lacking. A report by Marx et al, observed that of three cases of ONJ associated with Fosamax® exposure, one patient had been taking 10 mg/day by mouth for 6 years and the other two patients 10 mg/day by mouth for 3 and 2 years respectively. In contrast, they observed that in cancer patients receiving intravenous bisphosphonates, the time period between the first doses of the bisphosphonate to first recognition of exposed bone either by the patients or by the clinician, was 9.4 months for zoledronate (Zometa®), 14.3 months for pamidronate (Aredia®), and 12.1 months for pamidronate then to zoledronate.

Dental Health: Effects on Dental TreatmentOsteonecrosis of the jaw (ONJ), generally associated with local infection and/or tooth extraction and often with delayed healing, has been reported in patients taking bisphosphonates. Symptoms included nonhealing extraction socket or an exposed jawbone. Most reported cases of bisphosphonate-associated osteonecrosis have been in cancer patients treated with intravenous bisphosphonates. However, some have occurred in patients with postmenopausal osteoporosis taking oral bisphosphonates. Dental surgery may exacerbate ONJ. For patients requiring dental procedures, there are no data available to suggest whether discontinuation of bisphosphonate treatment reduces the risk of ONJ. Patients who develop ONJ while on bisphosphonate therapy should receive care by an oral surgeon. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause depression, insomnia, anxiety, and dizziness

Mental Health: Effects on Psychiatric TreatmentNausea and diarrhea are common; concomitant use with SSRIs, lithium, valproic acid, or carbamazepine may produce additive effects

Index TermsRisedronate Sodium

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Medication Safety Issues

Sound-alike/look-alike issues:

Risperidone may be confused with reserpine

Risperdal® may be confused with lisinopril, reserpine

Pronunciation(ris PER i done)

U.S. Brand NamesRisperdal®; Risperdal® Consta®; Risperdal® M-Tab®

Canadian Brand NamesApo-Risperidone®; CO Risperidone; Dom-Risperidone; Gen-Risperidone; Novo-Risperidone; PHL-Risperidone; PMS-Risperidone ODT; PRO-Risperidone; Ran-Risperidone; Ratio-Risperidone; Risperdal®; Risperdal® Consta®; Risperdal® M-Tab®; Riva-Risperidone; Sandoz Risperidone

Pharmacologic CategoryAntimanic Agent; Antipsychotic Agent, Atypical

Use: Labeled IndicationsTreatment of schizophrenia; treatment of acute mania or mixed episodes associated with bipolar I disorder (as monotherapy in children or adults, or in combination with lithium or valproate in adults); treatment of irritability/aggression associated with autistic disorder

Use: Unlabeled/InvestigationalTreatment of Tourette's disorder; treatment of pervasive developmental disorder; psychosis/agitation related to Alzheimer’s dementia

Dosing: Adults

Bipolar mania: Oral: Recommended starting dose: 2-3 mg once daily; if needed, adjust dose by 1 mg/day in intervals ≥24 hours; dosing range: 1-6 mg/day.

Schizophrenia:

Oral: Initial: 1 mg twice daily; may be increased by 1-2 mg/day at intervals ≥24 hours to a recommended dosage range of 4-8 mg/day; may be given as a single daily dose once maintenance dose is achieved; daily dosages >6 mg do not appear to confer any additional benefit, and the incidence of extrapyramidal symptoms is higher than with lower doses. Further dose adjustments should be made in increments/decrements of 1-2 mg/day on a weekly basis. Dose range studied in clinical trials: 4-16 mg/day. Maintenance: Recommended dosage range: 2-8 mg/day

I.M. (Risperdal® Consta®): 25 mg every 2 weeks; some patients may benefit from larger doses; maximum dose not to exceed 50 mg every 2 weeks. Dosage adjustments should not be made more frequently than every 4 weeks. A lower initial dose of 12.5 mg may be appropriate in some patients.

Note: Oral risperidone (or other antipsychotic) should be administered with the initial injection of Risperdal® Consta® and continued for 3 weeks (then discontinued) to maintain adequate therapeutic plasma concentrations prior to main release phase of risperidone from injection site.

Tourette's disorder (unlabeled use): Oral: Initial: 0.5 mg; titrate to 2-4 mg/day

Dosing: Elderly

Oral: A starting dose of 0.5 mg twice daily, and titration should progress slowly in increments of no more than 0.5 mg twice daily; increases to dosages >1.5 mg twice daily should occur at intervals of ≥1 week.

Psychosis/agitation related to Alzheimer’s dementia (unlabeled use): Initial: 0.25-1 mg/day; if necessary, gradually increase as tolerated not to exceed 1.5-2 mg/day

I.M. (Risperdal® Consta®): A lower initial dose of 12.5 mg may be appropriate.

Additional monitoring of renal function and orthostatic blood pressure may be warranted. If once-a-day dosing in the elderly or debilitated patient is considered, a twice daily regimen should be used to titrate to the target dose, and this dose should be maintained for 2-3 days prior to attempts to switch to a once-daily regimen.

Dosing: PediatricChildren and Adolescents:

Autism: Children ≥5 years and Adolescents: Oral:

<15 kg: Use with caution; specific dosing recommendations not available

<20 kg: Initial: 0.25 mg/day; may increase dose to 0.5 mg/day after ≥4 days, maintain dose for ≥14 days. In patients not achieving sufficient clinical response, may increase dose by 0.25 mg/day in ≥2-week intervals. Therapeutic effect reached plateau at 1 mg/day in clinical trials. Following clinical response, consider gradually lowering dose. May be administered once daily or in divided doses twice daily.

≥20 kg: Initial: 0.5 mg/day; may increase dose to 1 mg/day after ≥4 days, maintain dose for ≥14 days. In patients not achieving sufficient clinical response, may increase dose by 0.5 mg/day in ≥2-week intervals. Therapeutic effect reached plateau at 2.5 mg/day (3 mg/day in children >45 kg) in clinical trials. Following clinical response, consider gradually lowering dose. May be administered once daily or in divided doses twice daily.

Bipolar disorder: Children and Adolescents 10-17 years: Oral: Initial: 0.5 mg once daily; dose may be adjusted in increments of 0.5-1 mg/day at intervals ≥24 hours to a dose of 2.5 mg/day. Doses ranging from 0.5-6 mg/day have been evaluated, however doses >2.5 mg/day do not confer additional benefit and are associated with increased adverse events.

Pervasive developmental disorder (unlabeled use): Oral: Initial: 0.25 mg twice daily; titrate up 0.25 mg/day every 5-7 days; optimal dose range: 0.75-3 mg/day

Schizophrenia: Adolescents 13-17 years: Oral: Initial: 0.5 mg once daily; dose may be adjusted in increments of 0.5-1 mg/day at intervals ≥24 hours to a dose of 3 mg/day. Doses ranging from 1-6 mg/day have been evaluated, however, doses >3 mg/day do not confer additional benefit and are associated with increased adverse events.

Tourette's disorder (unlabeled use): Refer to adult dosing.

Dosing: Renal Impairment

Oral: Starting dose of 0.5 mg twice daily; titration should progress slowly in increments of no more than 0.5 mg twice daily; increases to dosages >1.5 mg twice daily should occur at intervals of ≥1 week. Clearance of the active moiety is decreased by 60% in patients with moderate-to-severe renal disease compared to healthy subjects.

I.M.: An initial dose of 12.5 mg may be considered

Dosing: Hepatic Impairment

Oral: Starting dose of 0.5 mg twice daily; titration should progress slowly in increments of no more than 0.5 mg twice daily; increases to dosages >1.5 mg twice daily should occur at intervals of ≥1 week. The mean free fraction of risperidone in plasma was increased by 35% in patients with hepatic impairment compared to healthy subjects.

I.M.: An initial dose of 12.5 mg may be considered

Administration: I.M.Risperdal® Consta® should be administered I.M. into either the deltoid muscle or the upper outer quadrant of the gluteal area. Avoid inadvertent injection into vasculature. Injection should alternate between the two arms or buttocks. Do not combine two different dosage strengths into one single administration. Do not substitute any components of the dose-pack; administer with needle provided (1-inch needle for deltoid administration or 2-inch needle for gluteal administration).

Administration: OralOral solution can be mixed with water, coffee, orange juice, or low-fat milk, but is **not compatible** with cola or tea. May be administered with or without food.

In children or adolescents experiencing somnolence, half the daily dose may be administered twice daily **or** the once-daily dose may be administered at bedtime.

When reinitiating treatment after discontinuation, the initial titration schedule should be followed.

Risperdal® M-Tabs® should not be removed from blister pack until administered. Using dry hands, place immediately on tongue. Tablet will dissolve within seconds, and may be swallowed with or without liquid. Do not split or chew.

Dietary ConsiderationsMay be taken with or without food. Risperdal® M-Tabs® contain phenylalanine.

Storage

Injection: Risperdal® Consta®: Store in refrigerator at 2°C to 8°C (36°F to 46°F) and protect from light. May be stored at room temperature of 25°C (77°F) for up to 7 days prior to administration. Following reconstitution, store at room temperature and use within 6 hours. Suspension settles in ~2 minutes; shake vigorously to resuspend prior to administration.

Oral solution, tablet: Store at 15°C to 25°C (59°F to 77°F). Protect from light and moisture. Keep orally-disintegrating tablets sealed in foil pouch until ready to use. Do not freeze solution.

ReconstitutionRisperdal® Consta®: Bring to room temperature prior to reconstitution. Reconstitute with provided diluent only. Shake vigorously to mix; will form thick, milky suspension. Following reconstitution, store at room temperature and use within 6 hours. Suspension settles in ~2 minutes; shake vigorously to resuspend prior to administration.

ContraindicationsHypersensitivity to risperidone or any component of the formulation

Allergy Considerations

- Risperidone Allergy

Warnings/Precautions

Boxed warnings:

- Dementia: See “Disease-related concerns” below.

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction; life-threatening arrhythmias have occurred with therapeutic doses of antipsychotics. Use caution with history of conduction abnormalities. Relative to other neuroleptics, risperidone has a low risk of arrhythmias.
- Anticholinergic effects: May cause anticholinergic effects (confusion, agitation, constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, urinary retention, BPH, xerostomia, or visual problems. Relative to other neuroleptics, risperidone has a low potency of cholinergic blockade.
- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (eg, Alzheimer's disease).
- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is generally much lower relative to typical/conventional antipsychotics). Risk of dystonia (and probably other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.
- Hyperglycemia: Atypical antipsychotics have been associated with development of hyperglycemia; in some cases, may be extreme and associated with ketoacidosis, hyperosmolar coma, or death. Use with caution in patients with diabetes or other disorders of glucose regulation; monitor for worsening of glucose control.
- Neuroleptic malignant syndrome (NMS): Use may be associated with neuroleptic malignant syndrome (NMS); monitor for mental status changes, fever, muscle rigidity and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).
- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect (eg, concurrent medication use which may predispose to hypotension/bradycardia or presence of hypovolemia) or in those who would not tolerate transient hypotensive episodes. Use caution with history of cerebrovascular or cardiovascular disease (MI, heart failure, or ischemic disease).
- Priapism: Rare cases of priapism have been reported.
- Sedation: May be low to moderately sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Suicidal ideation: The possibility of a suicide attempt is inherent in psychotic illness or bipolar disorder; use with caution in high-risk patients during initiation of therapy. Prescriptions should be written for the smallest quantity consistent with good patient care.
- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.
- Weight gain: Significant weight gain has been observed with antipsychotic therapy; incidence varies with product. Monitor waist circumference and BMI.

Disease-related concerns:

- Dementia: **[U.S. Boxed Warning]: Elderly patients with dementia-related psychosis treated with antipsychotic drugs are at an increased risk of death compared to placebo.** An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Risperidone is not approved for the treatment of dementia-related psychosis.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Hepatic impairment: Use with caution in patients with hepatic disease or impairment; dosage reduction is recommended.

- Hyperprolactinemia: Elevates prolactin levels; effects seen in adults and children. Use with caution in breast cancer or other prolactin-dependent tumors.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use with caution in patients with Parkinson's disease.

- Renal impairment: Use with caution in patients with renal disease; dosage reduction is recommended.

- Seizures: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold. Elderly patients may be at increased risk of seizures due to an increased prevalence of predisposing factors.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reyes syndrome, brain tumor) due to antiemetic effects.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <5 years of age (<18 years of age for I.M. injection). Long-term effects on growth or sexual maturation have not been evaluated.

Dosage form specific issues:

- Vehicle used in injectable (polylactide-co-glycolide microspheres): Has rarely been associated with retinal artery occlusion in patients with abnormal arteriovenous anastomosis (eg, patent foramen ovale).

Geriatric ConsiderationsAny changes in disease status in any organ system can result in behavior changes.

Extrapyramidal syndrome symptoms occur less with this agent when total daily dose remains <6 mg as compared with phenothiazines and butyrophenone classes of antipsychotics. Many elderly patients receive antipsychotic medications for inappropriate nonpsychotic behavior. Before initiating antipsychotic medication, the clinician should investigate any possible reversible cause; any stress or stress from any disease can cause acute “confusion” or worsening of baseline nonpsychotic behavior. Most commonly acute changes in behavior are due to increases in drug dose or addition of new drug to regimen; fluid electrolyte loss; infections; and changes in environment.

In the treatment of agitated, demented, elderly patients, authors of meta-analysis of controlled trials of the response to the traditional antipsychotics (phenothiazines, butyrophenones) in controlling agitation have concluded that the use of neuroleptics results in a response rate of 18%. Clearly neuroleptic therapy for behavior control should be limited with frequent attempts to withdraw the agent given for behavior control. In light of significant risks and adverse effects in elderly population compared with limited data demonstrating efficacy in the treatment of dementia related psychosis, aggression, and agitation, an extensive risk:benefit analysis should be performed prior to use.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies indicate an increase in fetal mortality. Reversible EPS symptoms were noted in neonates following use of risperidone during the last trimester. Agenesis of the corpus callosum has also been noted in one case report. There are no adequate and well-controlled studies in pregnant women. When using Risperdal® Consta®, patients should notify healthcare provider if they become or intend to become pregnant during therapy or within 12 weeks of last injection. Risperidone may cause hyperprolactinemia, which may decrease reproductive function in both males and females. Healthcare providers are encouraged to enroll women 18-45 years of age exposed to risperidone during pregnancy in the Atypical Antipsychotics Pregnancy Registry (1-866-961-2388).

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsRisperidone and its metabolite are excreted in breast milk; it is recommended that women not breast-feed during therapy or for 12 weeks after the last injection if using Risperdal® Consta®.

Adverse ReactionsThe frequency of adverse effects is reported as absolute percentages and is not based upon net frequencies as compared to placebo. Actual frequency may be dependant upon dose and/or indication. Events are reported from placebo-controlled studies and not with combination therapy. Unless otherwise noted, frequency of adverse effects is reported for the oral formulation in adults.

>10%:

Central nervous system: Somnolence (children 12% to 67%; adults 5% to 14%; I.M. injection 5% to 6%), fatigue (children 18% to 42%; adults 1% to 3%), headache (I.M. injection 15% to 21%), fever (children 20%; adults 1% to 2%), dystonia (children 9% to 18%; adults 5% to 11%), anxiety (children ≤16%; adults 2% to 16%), dizziness (children 7% to 16%; adults 4% to 10%), Parkinsonism (children 2% to 16%; adults 12% to 20%)

Dermatologic: Rash (children ≤11%; adults 2% to 4%)

Gastrointestinal: Appetite increased (children 4% to 49%), vomiting (children 10% to 25%), salivation increased (children ≤22%; adults 1% to 3%), constipation (children 21%; adults 8% to 9%), abdominal pain (children 15% to 18%; adults 3% to 4%), nausea (children 8% to 16%; adults 4% to 9%), dyspepsia (children 5% to 16%; adults 4% to 10%), xerostomia (children 13%; adults ≤4%)

Genitourinary: Urinary incontinence (children 5% to 22%; adults <2%)

Neuromuscular & skeletal: Tremor (adults 6%; children 10% to 12%)

Respiratory: Rhinitis (children 13% to 36%; adults 7% to 11%), upper respiratory infection (children 34%; adults 2% to 3%), cough (children 34%; adults 3%)

1% to 10%:

Cardiovascular: Tachycardia (children ≤7%; adults 1% to 5%), chest pain (1% to 3%), creatine phosphokinase increased (≤2%), postural hypotension (≤2%), arrhythmia (≤1%), edema (≤1%), hypotension (≤1%), syncope (≤1%)

Central nervous system: Akathisia (children ≤10%; adults 5% to 9%), automatism (children 7%), confusion (children 5%)

Dermatologic: Seborrhea (up to 2%), acne (1%)

Endocrine & metabolic: Lactation nonpuerperal (children 2% to 5%; adults 1%), ejaculation failure (≤1%)

Gastrointestinal: Diarrhea (children 7% to 8%; adults ≤3%), anorexia (children 8%; adults ≤2%;), weight gain (children 5%; adults ≤1%), toothache (I.M. injection 1% to 3%)

Genitourinary: Urinary tract infection (≤3%)

Hematologic: Anemia (I.M. injection <2%; oral ≤1%)

Hepatic: Transaminases increased (I.M. injection ≥1%; oral 1%)

Neuromuscular & skeletal: Dyskinesia (children 7%; adults 1%), arthralgia (2% to 3%), back pain (2% to 3%), myalgia (≤2%), weakness (1%)

Ocular: Abnormal vision (children 4% to 7%; adults 1% to 3%), blurred vision (I.M. injection 2% to 3%)

Otic: Earache (1%)

Respiratory: Dyspnea (children 2% to 5%; adults 2%), epistaxis (≤2%)

≤1%, postmarketing, and/or case reports (limited to important or life-threatening): Agranulocytosis, allergic reaction, amenorrhea, amnesia, anaphylactic reaction, angina pectoris, angioedema, antidiuretic hormone disorder, aphasia, apnea, ascites, aspiration, asthma, atrial fibrillation, AV block, bronchospasm, cachexia, catatonic reaction, cerebrovascular accident, cerebrovascular disorder, cholecystitis, cholelithiasis, cholestatic hepatitis, cholinergic syndrome, coma, dehydration, delirium, depression, diabetes mellitus, diabetic ketoacidosis, diverticulitis, dysphagia, esophagitis, esophageal dysmotility, fecal incontinence, flu-like syndrome, gastroenteritis, hematemesis, hematuria, hemorrhage, hepatic failure, hepatocellular damage, hyper-/hypoglycemia, hyperphosphatemia, hypertriglyceridemia, hyperuricemia, hypokalemia, hyponatremia, hypoproteinemia, intestinal obstruction, jaundice, leukocytosis, leukopenia, leukorrhea, lymphadenopathy, mastitis, menstrual irregularities, migraine, myocardial infarction, myocarditis, palpitation, pancreatitis, Pelger-Huët anomaly, pituitary adenomas, pneumonia, precocious puberty, premature atrial contractions, priapism, pulmonary embolism, purpura, QT_c prolongation, RBC disorders, renal insufficiency, retinal artery occlusion (I.M. formulation), rigors, sarcoidosis, skin exfoliation, skin ulceration, ST depression, stomatitis, stridor, stroke, superficial phlebitis, synostosis, T wave inversions, thrombocytopenia, thrombophlebitis, thrombotic thrombocytopenic purpura, tinnitus, tongue discoloration, tongue edema, tongue paralysis, torticollis, transient ischemic attack, urinary retention, urticaria, ventricular extrasystoles, ventricular tachycardia, water intoxication, withdrawal syndrome, xerophthalmia

Metabolism/Transport Effects **Substrate** of CYP2D6 (major), 3A4 (minor); **Inhibits** CYP2D6 (weak), 3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Atypical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

CarBAMazepine: May decrease the serum concentration of Risperidone. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Risperidone. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Valproic Acid: May enhance the adverse/toxic effect of Risperidone. Generalized edema has developed. *Risk C: Monitor therapy*

Verapamil: May increase the serum concentration of Risperidone. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid kava kava, gotu kola, valerian, St John's wort (may increase CNS depression).

Monitoring ParametersVital signs; fasting lipid profile and fasting blood glucose/Hgb A_{1c} (prior to treatment, at 3 months, then annually); BMI, personal/family history of obesity, waist circumference; blood pressure; mental status, abnormal involuntary movement scale (AIMS), extrapyramidal symptoms; orthostatic blood pressure changes for 3-5 days after starting or increasing dose. Weight should be assessed prior to treatment, at 4 weeks, 8 weeks, 12 weeks, and then at quarterly intervals. Consider titrating to a different antipsychotic agent for a weight gain ≥5% of the initial weight.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Monitor results of periodic ophthalmic exams. Assess therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Monitor weight prior to initiating therapy and at least monthly. Be alert to the potential for orthostatic hypotension, especially during the titration phase. Initiate at lower doses and titrate to target dose. Taper dosage slowly when discontinuing. Teach patient appropriate use, possible side effects, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsFasting lipid profile and fasting blood glucose/Hgb A_{1c} (prior to treatment, at 3 months, then annually)

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Use exactly as directed; do not increase dose or frequency. It may take several weeks to achieve desired results; do not discontinue without consulting prescriber. Dilute solution with water, milk, or orange juice; do not dilute with beverages containing tannin or pectinate (eg, colas, tea). Avoid alcohol or caffeine unless approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, you may experience increased blood sugars. Monitor blood sugars closely. You may experience excess sedation, drowsiness, restlessness, dizziness, or blurred vision (use caution driving or when engaging in tasks requiring alertness until response to drug is known); dry mouth, nausea, or GI upset (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); or urinary retention (void before taking medication). Report persistent CNS effects (eg, trembling fingers, altered gait or balance, excessive sedation, seizures, unusual muscle or skeletal movements, anxiety, abnormal thoughts [especially thoughts of suicide], confusion, personality changes); chest pain, palpitations, rapid heartbeat, severe dizziness; swelling or pain in breasts (male and female), altered menstrual pattern, sexual dysfunction; pain or difficulty on urination; vision changes; skin rash or yellowing of skin; respiratory difficulty; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, microspheres for reconstitution, extended release:

Risperdal® Consta®: 12.5 mg, 25 mg, 37.5 mg, 50 mg [contains polylactide-co-glycolide; supplied in a dose-pack containing vial with active ingredient in microsphere formulation, prefilled syringe with diluent, needle-free vial access device, and 2 safety needles (1- and 2-inch)]

Solution, oral: 1 mg/mL (30 mL)

Risperdal®: 1 mg/mL (30 mL) [contains benzoic acid]

Tablet: 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg

Risperdal®: 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg

Tablet, orally disintegrating: 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg

Risperdal® M-Tabs®: 0.5 mg [contains phenylalanine 0.14 mg]; 1 mg [contains phenylalanine 0.28 mg]; 2 mg [contains phenylalanine 0.42 mg]; 3 mg [contains phenylalanine 0.63 mg]; 4 mg [contains phenylalanine 0.84 mg]

Generic AvailableYes: Excludes injection

1 mg (60): $195.98

2 mg (60): $289.96

3 mg (60): $299.99

4 mg (60): $399.98

Mechanism of ActionRisperidone is a benzisoxazole atypical antipsychotic with mixed serotonin-dopamine antagonist activity that binds to 5-HT$_2$-receptors in the CNS and in the periphery with a very high affinity; binds to dopamine-D$_2$ receptors with less affinity. The binding affinity to the dopamine-D$_2$ receptor is 20 times lower than the 5-HT$_2$ affinity. The addition of serotonin antagonism to dopamine antagonism (classic neuroleptic mechanism) is thought to improve negative symptoms of psychoses and reduce the incidence of extrapyramidal side effects. Alpha$_1$, alpha$_2$ adrenergic, and histaminergic receptors are also antagonized with high affinity. Risperidone has low to moderate affinity for 5-HT$_{1C}$, 5-HT$_{1D}$, and 5-HT$_{1A}$ receptors, weak affinity for D$_1$ and no affinity for muscarinics or beta$_1$ and beta$_2$ receptors

Pharmacodynamics/Kinetics

Absorption:

Oral: Rapid and well absorbed; food does not affect rate or extent

Injection: <1% absorbed initially; main release occurs at ~3 weeks and is maintained from 4-6 weeks

Distribution: V$_d$: 1-2 L/kg

Protein binding, plasma: Risperidone 90%; 9-hydroxyrisperidone: 77%

Metabolism: Extensively hepatic via CYP2D6 to 9-hydroxyrisperidone (similar pharmacological activity as risperidone); *N*-dealkylation is a second minor pathway

Bioavailability: Oral: 70%; Tablet (relative to solution): 94%; orally-disintegrating tablets and oral solution are bioequivalent to tablets

Half-life elimination: Active moiety (risperidone and its active metabolite 9-hydroxyrisperidone)

Oral: 20 hours (mean)

Extensive metabolizers: Risperidone: 3 hours; 9-hydroxyrisperidone: 21 hours

Poor metabolizers: Risperidone: 20 hours; 9-hydroxyrisperidone: 30 hours

Injection: 3-6 days; related to microsphere erosion and subsequent absorption of risperidone

Time to peak, plasma: Oral: Risperidone: Within 1 hour; 9-hydroxyrisperidone: Extensive metabolizers: 3 hours; Poor metabolizers: 17 hours

Excretion: Urine (70%); feces (14%)

Pharmacotherapy PearlsRisperdal® Consta® is an injectable formulation of risperidone using the extended release Medisorb® drug-delivery system; small polymeric microspheres degrade slowly, releasing the medication at a controlled rate.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation) and toothache.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Child/Adolescent Considerations

Aggression: In a randomized, double-blind, placebo-controlled study, 10 children and adolescents 6-14 years of age (mean: 9.2 ± 2.9 years) with conduct disorder and prominent aggressive behavior received risperidone in the following doses: Patients <50 kg: Initial: 0.25 mg once daily; doses were increased as needed by 0.25 mg/day increments each week to a maximum of 1.5 mg/day; patients ≥50 kg: Initial: 0.5 mg once daily; doses were increased as needed by 0.5 mg/day increments each week to a maximum of 3 mg/day; final dose: 0.75-1.5 mg/day; mean: 0.028 ± 0.004 mg/kg/day (Findling, 2000). In another randomized, double-blind, placebo-controlled study, 19 adolescents (mean age: 14 ± 1.5 years; 7 with borderline IQ and 6 with mild mental retardation) received initial risperidone doses of 0.5 mg twice daily; doses were increased as needed by 1 mg/day increments up to a planned maximum of 5 mg twice daily; final doses: Range: 1.5-4 mg/day (0.019-0.08 mg/kg/day); mean: 2.9 mg/day (0.044 mg/kg/day); the authors recommend the following initial doses for clinical practice: Patients <25 kg: 0.25 mg/day; patients ≥25 kg: 0.5 mg/day (Buitelaar, 2001).

In an open trial, 26 children and adolescents 10-18 years of age (mean: 15 ± 1.9 years) with a borderline IQ (n=19) or mild mental retardation (n=5) received initial risperidone doses of 0.5 mg/day; doses were increased by 0.5-1 mg/day increments every 3 days up to a planned maximum of 6 mg/day and given in twice daily doses; final dose: 0.5-4 mg/day; mean: 2.1 ± 1 mg/day (Buitelaar, 2000). Eleven children and adolescents 5.5-16 years of age (mean: 9.8 years) with mood disorders and aggressive behavior received risperidone in titrated doses in an open trial; final dose: 0.75-2.5 mg/day given in 2-3 divided doses (Schreier, 1998).

Autism: A multicenter double-blind, placebo-controlled trial of risperidone in children and adolescents 5-17 years of age (mean: 8.8 ± 2.7 years) with autism and serious behavioral problems demonstrated the short-term efficacy of risperidone for the treatment of aggression, tantrums, or self-injurious behavior. The following doses were used: Children 15-20 kg: Initial: 0.25 mg/day. Children 20-45 kg: Initial: 0.5 mg at bedtime on days 1-3 and 0.5 mg twice daily on day 4; dose was gradually increased in 0.5 mg increments to a maximum dose of 2.5 mg/day. Children >45 kg: Maximum dose: 3.5 mg/day; mean effective dose: 1.8 ± 0.7 mg/day (range: 0.5-3.5 mg/day) (McCracken, 2002).

In an open-labeled prospective study, 10 boys 4.5-10.8 years of age (mean: 7.2 ± 2.2 years) with autistic disorder were started on risperidone 0.5 mg/day; final dose: range: 1-2.5 mg/day (0.03-0.08 mg/kg/day); mean: 1.3 ± 0.5 mg/day (0.05 ± 0.2 mg/kg/day) (Nicolson, 1998). In an open clinical trial, 6 children 5-9 years of age (mean: 7.33 years) with autistic disorder were started on risperidone monotherapy 0.25 mg at bedtime; final dose: range: 0.75-1.5 mg/day (0.03-0.06 mg/kg/day); mean: 1.1 mg (0.04 mg/kg/day) (Findling, 1997).

Bipolar disorder: In a retrospective chart review, 28 children and adolescents 4-17 years of age (mean: 10.4 ± 3.8 years) were treated for bipolar disorder; optimal mean dose: 1.7 ± 1.3 mg/day (Frazier 1999).

Pervasive developmental disorders (PDDs): In a prospective open-labeled study, children and adolescents 5-18 years of age (mean 10.2 ± 3.7 years) were treated for PDDs (11 with autistic disorder) with initial doses of 0.5 mg at night; optimal dose: 1-4 mg/day (mean: 1.8 ± 1 mg/day) (McDougle, 1997). Fourteen children and adolescents 9-17 years of age (mean: 12.7 ± 4 years) were treated in an open case series, for PDDs (4 with autistic disorder) with initial doses of 0.25 mg twice daily; optimal dose: 0.75-1.5 mg/day given in divided doses (Fisman, 1996). In an open trial, 6 children and adolescents 7-14 years of age (mean: 10.7 ± 3.3 years) were treated for PDDs (5 with autistic disorder; all 6 with severe behavioral problems) with initial doses of 0.5 mg once or twice daily; optimal dose: 1-6 mg/day (mean 2.7 ± 2.2 mg/day) (Perry, 1997). Twenty children and adolescents (age: 8-17 years) with developmental disorders refractory to previous psychotropic agents were treated in an open clinical trial with risperidone; final doses: 1.5-10 mg/day; responders: 1-4 mg/day; nonresponders: 4.5-10 mg/day (Hardan, 1996).

Schizophrenia: In a prospective, open-labeled pilot study, 10 children and adolescents 11-18 years of age (mean: 15.1 years) were treated for schizophrenia with initial doses of 1 mg twice daily; final dose: Range: 4-10 mg/day (0.05-0.17 mg/kg/day); mean: 6.6 mg/day (0.095 mg/kg/day) (Armenteros, 1997). In a retrospective study, 16 children and adolescents 9-20 years of age (mean 14.9 ± 2.73 years) were treated for psychotic disorders with initial doses of 1 mg twice daily; optimal dose: 2-10 mg/day (mean: 5.9 ± 2.8 mg/day) divided and given in 2-3 doses/day (Grcevich, 1996).

Tourette's syndrome: In a multicenter, double-blind, parallel-group comparative study, 50 patients 11-50 years of age were treated for Tourette's syndrome with risperidone versus pimozide; final dose: 0.5-6 mg/day (mean: 3.8 mg/day) (Bruggeman, 2001).

Seven children and adolescents 11-16 years of age (mean: 12.9 ± 1.9 years) were treated in a prospective open-labeled trial for chronic tic disorders (5 with Tourette's syndrome) with initial doses of 0.5 mg at bedtime; final dose: 1-2.5 mg/day (Lombroso, 1995). In a retrospective review, 28 children and adolescents 5-18 years of age (mean 11.1 ± 3.6 years) with Tourette's syndrome and aggressive behavior were treated with risperidone; final dose: 0.5-9 mg/day (mean: 2 mg/day) (Sandor, 2000).

Mental Health Comment

Risperidone is an antipsychotic agent of a class often referred to as atypical. It should be noted that the definition of the term “atypical” is not universally agreed upon. Some prefer to describe antipsychotics based on their pharmacological properties. A common feature of all definitions used to describe “atypical” antipsychotics is the lack of significant acute or subacute EPS, at dosages generally associated with antipsychotic actions. Other experts have included definitions of atypicality that include a) failure to increase serum prolactin levels; b) superior efficacy for positive, negative, and cognitive symptoms; and c) lack of evidence of tardive dyskinesia or dystonia following chronic administration.

Risperidone is associated with a dose dependent increase in EPS. Optimal dosage for most patients is ~4 mg/day. EPS is low when dosed ≤6 mg/day. Dosages >6 mg/day give a clinical picture similar to haloperidol.

Tardive dyskinesia (TD) secondary to **typical** antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. The incidence of TD associated with the atypical antipsychotics is estimated to be 0.5% to 1%. It is not clear if this estimate represents a risk associated with mental illness or to what extent drug therapy can be implicated. Atypical antipsychotics appear less likely to cause tardive dyskinesia than typical antipsychotics (fluphenazine, haloperidol).

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

The long acting dosage form of risperidone is formed by cross-linking polylactide and glycolide molecules into a polymer, then exposing that polymer to risperidone to create microspheres that are 25-150 microns in diameter. The microspheres must be suspended in the water-based diluent (provided in the kit) prior to injection. Since the microspheres may not be uniformly distributed in the diluent, the entire contents of the vial must be injected to ensure accurate dosing (dividing a dose is not accurately possible). Further, the bore of the needle (included in the kit) is Teflon® coated to prevent destruction of the microspheres and loss of drug due to sticking to the interior surface during injection.

Approximately 1% of the drug is released for the first 3 weeks after an injection. Therefore, one must overlap with oral therapy for at least 3 weeks and often 4-6 weeks or longer. This dosage form is not amenable to loading dose strategies. However, it is water-based (as opposed to oil) and is associated with less pain after injection than haloperidol decanoate or fluphenazine decanoate. The vials can be stored at room temperature for ≤7 days total prior to reconstitution and should be stored in a refrigerator until the day of injection.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Cardiovascular Considerations

Risperidone may cause orthostatic hypotension and tachycardia but to a degree which may be less than is seen with other agents (eg, phenothiazines: chlorpromazine, thioridazine). Risperidone may also prolong the QT interval. For these reasons, patient's with cardiovascular disease should be monitored closely while on therapy.

Anesthesia and Critical Care Concerns/Other Considerations

Risperidone may cause orthostatic hypotension and tachycardia but to a degree which may be less than is seen with other agents (eg, phenothiazines: chlorpromazine, thioridazine).

Ritonavir

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Ritonavir may be confused with Retrovir®

Norvir® may be confused with Norvasc®

Pronunciation(ri TOE na veer)

U.S. Brand NamesNorvir®

Canadian Brand NamesNorvir®; Norvir® SEC

Pharmacologic CategoryAntiretroviral Agent, Protease Inhibitor

Use: Labeled IndicationsTreatment of HIV infection; should always be used as part of a multidrug regimen (at least three antiretroviral agents); may be used as a pharmacokinetic "booster" for other protease inhibitors

Dosing: Adults

Treatment of HIV infection: Oral: 600 mg twice daily; dose escalation tends to avoid nausea that many patients experience upon initiation of full dosing. Escalate the dose as follows: 300 mg twice daily for 1 day, 400 mg twice daily for 2 days, 500 mg twice daily for 1 day, then 600 mg twice daily. Ritonavir may be better tolerated when used in combination with other antiretrovirals by initiating the drug alone and subsequently adding the second agent within 2 weeks.

Pharmacokinetic “booster” in combination with other protease inhibitors: 100-400 mg/day

Refer to individual monographs; specific dosage recommendations often require adjustment of both agents.

Dosage adjustments for ritonavir when administered in combination therapy:

Amprenavir: Adjustments necessary for each agent:

Amprenavir 1200 mg with ritonavir 200 mg once daily **or**

Amprenavir 600 mg with ritonavir 100 mg twice daily

Amprenavir plus efavirenz (3-drug regimen): Amprenavir 1200 mg twice daily plus ritonavir 200 mg twice daily plus efavirenz at standard dose

Indinavir: Adjustments necessary for agent:

Indinavir 800 mg twice daily plus ritonavir 100-200 mg twice daily **or**

Indinavir 400 mg twice daily plus ritonavir 400 mg twice daily

Nelfinavir: Ritonavir 400 mg twice daily

Rifabutin: Decrease rifabutin dose to 150 mg every other day

Saquinavir: Ritonavir 400 mg twice daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

HIV infection: Oral: Children >1 month: 350-400 mg/m^2 twice daily (maximum dose: 600 mg twice daily). Initiate dose at 250 mg/m^2 twice daily; titrate dose upward every 2-3 days by 50 mg/m^2 twice daily.

Dosing: Hepatic ImpairmentNo adjustment required in mild or moderate impairment; however, careful monitoring is required in moderate hepatic impairment (levels may be decreased); caution advised with severe impairment (no data available).

Calculations

- Body Surface Area: Pediatrics

Administration: OralAdminister with food. Liquid formulations usually have an unpleasant taste. Consider mixing it with chocolate milk or a liquid nutritional supplement. Whenever possible, administer oral solution with calibrated dosing syringe. Shake liquid well before use.

Dietary ConsiderationsShould be taken with food. Oral solution contains 43% ethanol by volume.

Storage

Capsule: Store under refrigeration at 2°C to 8°C (36°F to 46°F); may be left out at room temperature of <25°C (<77°F) if used within 30 days. Protect from light. Avoid exposure to excessive heat.

Solution: Store at room temperature at 20°C to 25°C (68°F to 77°F); do not refrigerate. Avoid exposure to excessive heat.

ContraindicationsHypersensitivity to ritonavir or any component of the formulation; concurrent alfuzosin, amiodarone, cisapride, dihydroergotamine, ergonovine, ergotamine, flecainide, methylergonovine, midazolam, pimozide, propafenone, quinidine, triazolam, and voriconazole (when ritonavir ≥800 mg/day)

Allergy Considerations

- Ritonavir Allergy

Warnings/Precautions

Boxed warnings:

- High potential for interactions: See "Concurrent drug therapy issues" below.

Concerns related to adverse effects:

- Hypersensitivity reactions: Protease inhibitors have been associated with a variety of hypersensitivity events (some severe), including rash, anaphylaxis (rare), angioedema, bronchospasm, erythema multiforme, and/or Stevens-Johnson syndrome (rare). It is generally recommended to discontinue treatment if severe rash or moderate symptoms accompanied by other systemic symptoms occur.

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).

- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.

- Increased cholesterol: Increases in total cholesterol and triglycerides have been reported; screening should be done prior to therapy and periodically throughout treatment.

- PR interval prolongation: Ritonavir has been associated with AV block due to prolongation of PR interval; use caution with drugs that prolong the PR interval.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiomyopathy, ischemic heart disease, pre-existing conduction abnormalities, or structural heart disease; may be at increased risk of conduction abnormalities (eg, second- or third-degree AV block).

- Diabetes: Changes in glucose tolerance, hyperglycemia, exacerbation of diabetes, DKA, and new-onset diabetes mellitus have been reported in patients receiving protease inhibitors.

- Hemophilia A or B: Use with caution in patients with hemophilia A or B; increased bleeding events, including spontaneous skin hematoma and hemarthrosis, during protease inhibitor therapy have been reported.

- Hepatic impairment: May cause hepatitis, jaundice, and/or exacerbation of pre-existing hepatic dysfunction; use with caution in patients with underlying hepatic disease, such as hepatitis B or C or cirrhosis; monitor transaminases.

- Pancreatitis: Use with caution in patients with increased triglycerides; pancreatitis has been observed. Monitor serum lipase and amylase, and for symptoms of nausea, vomiting, and/or abdominal pain.

Concurrent drug therapy issues:

- High potential for interactions: **[U.S. Boxed Warning]: Ritonavir may interact with many medications, resulting in potentially serious and/or life-threatening adverse events.** Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see drug interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

- Not recommended for use with alfuzosin, amiodarone, cisapride, ergot derivatives, flecainide, lovastatin, midazolam, pimozide, propafenone quinidine, simvastatin, St John's wort, triazolam, or voriconazole.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <1 month of age.

Pregnancy Risk FactorB

Pregnancy ConsiderationsNo increased risk of overall birth defects has been observed following 1st trimester exposure according to data collected by the antiretroviral pregnancy registry. Early studies have shown lower plasma levels during pregnancy compared to postpartum. If needed during pregnancy, use in combination with another PI to boost levels of second PI. Pregnancy and protease inhibitors are both associated with an increased risk of hyperglycemia. Glucose levels should be closely monitored. The Perinatal HIV Guidelines Working Group considers ritonavir to be an alternative PI for use during pregnancy. Healthcare professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse ReactionsPercentages as reported for combined experiences in both treatment-naive and experienced adults:

>10%:

Endocrine & metabolic: Hypercholesterolemia (>240 mg/dL: 37% to 45%), triglycerides increased (>800 mg/dL: 17% to 34%; >1500 mg/dL: 1%

to 13%)

Gastrointestinal: Nausea (26% to 30%), diarrhea (15% to 23%), vomiting (14% to 17%), taste perversion (7% to 11%)

Hepatic: GGT increased (5% to 20%)

Neuromuscular & skeletal: Weakness (10% to 15%), creatine phosphokinase increased (9% to 12%)

2% to 10%:

Cardiovascular: Vasodilation (2%)

Central nervous system: Fever (1% to 5%), dizziness (3% to 4%), insomnia (2% to 3%), somnolence (2% to 3%), depression (2%), anxiety (up to 2%)

Dermatologic: Rash (up to 4%)

Endocrine & metabolic: Uric acid increased (up to 4%)

Gastrointestinal: Abdominal pain (6% to 8%), anorexia (2% to 8%), dyspepsia (up to 6%), local throat irritation (2% to 3%)

Hepatic: Transaminases increased (6% to 10%)

Neuromuscular & skeletal: Paresthesia (3% to 7%), arthralgia (up to 2%), myalgia (2%)

Respiratory: Pharyngitis (≤1% to 3%)

Miscellaneous: Diaphoresis (2% to 3%)

<2% (Limited to important or life-threatening): Abnormal vision, acute myeloblastic leukemia, adrenal cortex insufficiency, allergic reaction, amnesia, anemia, angioedema, aphasia, asthma, bronchospasm, cachexia, cerebral ischemia, cerebral venous thrombosis, chest pain, cholestatic jaundice, coma, dehydration, dementia, depersonalization, diabetes mellitus, dyspnea, edema, esophageal ulcer, gastroenteritis, gastrointestinal hemorrhage, hallucinations, hepatic coma, hepatitis, hepatomegaly, hepatosplenomegaly, hypercholesteremia, hyper-/hypotension, hypothermia, hypoventilation, ileus, interstitial pneumonia, kidney failure, larynx edema, leukopenia, lymphadenopathy, lymphocytosis, manic reaction, MI, myeloproliferative disorder, neuropathy, palpitation, pancreatitis, paralysis, postural hypotension, pseudomembranous colitis, rectal hemorrhage, seizure, skin melanoma, subdural hematoma, syncope, tachycardia, thrombocytopenia, tongue edema, ulcerative colitis, urticaria, vasospasm

Postmarketing and/or case reports: Adrenal suppression. anaphylaxis, atrioventricular block (first, second or third degree), bleeding increased (in patients with hemophilia A or B), Cushing's syndrome, orthostatic hypotension, redistribution of body fat, right bundle branch block, Stevens-Johnson syndrome

Metabolism/Transport Effects **Substrate** of CYP1A2 (minor), 2B6 (minor), 2D6 (major), 3A4 (major); **Inhibits** CYP2C8 (strong), 2C9 (weak), 2C19 (weak), 2D6 (strong), 2E1 (weak), 3A4 (strong); **Induces** CYP1A2 (weak), 2C8 (weak), 2C9 (weak), 3A4 (weak)

Drug Interactions

Abacavir: Protease Inhibitors may decrease the serum concentration of Abacavir. *Risk C: Monitor therapy*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amiodarone: Protease Inhibitors may decrease the metabolism of Amiodarone. *Risk X: Avoid combination*

Antacids: May decrease the absorption of Protease Inhibitors. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). Management: Limit indinavir to 600mg every 8 hours with itraconazole or ketoconazole. When used with ritonavir, limit ketoconazole to 200mg/day. Tipranavir labeling recommends limiting fluconazole, itraconazole, and ketoconazole to 200mg with tipranavir/ritonavir. **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Atovaquone: Ritonavir may decrease the serum concentration of Atovaquone. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Protease Inhibitors may decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

BuPROPion: Ritonavir may decrease the serum concentration of BuPROPion. *Risk C: Monitor therapy*

Calcium Channel Blockers (Dihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). Increased serum concentrations of the calcium channel blocker may increase risk of AV nodal blockade. *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Protease Inhibitors. Protease Inhibitors may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cisapride: Protease Inhibitors may decrease the metabolism of Cisapride. The resultant increase in serum cisapride concentrations may result in QTc prolongation and malignant cardiac arrhythmias. *Risk X: Avoid combination*

Clarithromycin: Protease Inhibitors may diminish the therapeutic effect of Clarithromycin. Specifically, certain protease inhibitors may decrease formation of the active 14-hydroxy-clarithromycin metabolite, which may negatively impact clarithromycin effectiveness vs. H. influenzae and other non-MAC infections. Protease Inhibitors may increase the serum concentration of Clarithromycin. Clarithromycin dose adjustment in renally impaired patients may be needed. Clarithromycin may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Codeine: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): Protease Inhibitors may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk D: Consider therapy modification*

CycloSPORINE: Protease Inhibitors may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Strong) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Strong) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Delavirdine: Protease Inhibitors may decrease the serum concentration of Delavirdine. Delavirdine may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Digoxin: Protease Inhibitors may increase the serum concentration of Digoxin. Increased serum concentrations of digoxin may increase risk of AV nodal blockade. *Risk C: Monitor therapy*

Disulfiram: May enhance the adverse/toxic effect of Ritonavir. This is specific for the lopinavir/ritonavir (Kaletra) oral solution due to its alcohol content (42%). Management: Concomitant use of Kaletra (lopinavir/ritonavir) oral solution and disulfiram should be avoided. Kaletra contains 42% alcohol. *Risk X: Avoid combination*

Dronabinol: Ritonavir may increase the serum concentration of Dronabinol. *Risk C: Monitor therapy*

Efavirenz: May increase the metabolism of Protease Inhibitors. This specifically includes amprenavir, indinavir, and saquinavir. Efavirenz may increase the serum concentration of Protease Inhibitors. This specifically includes nelfinavir and ritonavir. *Risk D: Consider therapy modification*

Enfuvirtide: Protease Inhibitors may increase the serum concentration of Enfuvirtide. Enfuvirtide may increase the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

Eplerenone: Protease Inhibitors may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: Protease Inhibitors may decrease the metabolism of Ergot Derivatives. **Exceptions:** Cabergoline. *Risk X: Avoid combination*

Etravirine: Ritonavir may decrease the serum concentration of Etravirine. *Risk X: Avoid combination*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

FentaNYL: Protease Inhibitors may decrease the metabolism of FentaNYL. *Risk C: Monitor therapy*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Flecainide: Ritonavir may decrease the metabolism of Flecainide. *Risk X: Avoid combination*

Fusidic Acid: Protease Inhibitors may decrease the metabolism of Fusidic Acid. Fusidic Acid may decrease the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Garlic: May decrease the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Protease Inhibitors may increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. **Exceptions:** Fluvastatin. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

LamoTRIgine: Ritonavir may decrease the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Meperidine: Protease Inhibitors may enhance the adverse/toxic effect of Meperidine. Protease Inhibitors may decrease the serum concentration of Meperidine. Concentrations of the toxic Normeperidine metabolite may be increased. *Risk D: Consider therapy modification*

Methadone: Protease Inhibitors may decrease the metabolism of Methadone. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nefazodone: Protease Inhibitors may decrease the metabolism of Nefazodone. *Risk C: Monitor therapy*

Nevirapine: May increase the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): May diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May decrease the serum concentration of Ritonavir. Ritonavir may decrease the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Phosphodiesterase 5 Inhibitors: Protease Inhibitors may decrease the metabolism of Phosphodiesterase 5 Inhibitors. Management: Dose restrictions for tadalafil, and/or sildenafil and vardenafil are recommended in combination with ritonavir, atazanavir, indinavir, darunavir and saquinavir. Consult specific prescribing information for detailed recommendations. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Protease Inhibitors may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Propafenone: Ritonavir may decrease the metabolism of Propafenone. *Risk X: Avoid combination*

Protease Inhibitors: May increase the serum concentration of other Protease Inhibitors. Management: Atazanavir--indinavir combination contraindicated. Amprenavir oral solution not recommended with ritonavir oral solution; tipranavir/ritonavir or atazanavir/ritonavir not recommended with other protease inhibitors. Other combos may require dose changes. *Risk D: Consider therapy modification*

QuiNIDine: Protease Inhibitors may decrease the metabolism of QuiNIDine. *Risk X: Avoid combination*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: Protease Inhibitors may decrease the metabolism of Rifamycin Derivatives. Specifically rifabutin. Rifamycin Derivatives may decrease the serum concentration of Protease Inhibitors. Rifampin administration should be avoided. Dosage adjustments with both rifabutin and the protease inhibitors are necessary if used together. Management: Avoid using rifampin with protease inhibitors. Rifabutin and protease inhibitor dose adjustments will likely be required when using rifabutin together with protease inhibitors; consult specific protease inhibitor(s) prescribing information. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sirolimus: Protease Inhibitors may increase the serum concentration of Sirolimus. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Protease Inhibitors. *Risk X: Avoid combination*

Tacrolimus: Protease Inhibitors may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Tamoxifen: CYP2D6 Inhibitors (Strong) may decrease the metabolism of Tamoxifen. Specifically, strong CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk X: Avoid combination*

Temsirolimus: Protease Inhibitors may enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Tenofovir: May decrease the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Tenofovir. *Risk C: Monitor therapy*

Tetrabenazine: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Tetrabenazine. Specifically, concentrations of the active alpha- and beta-dihydrotetrabenazine metabolites may be increased. Management: Tetrabenazine dose should be reduced by 50% when starting a strong CYP2D6 inhibitor. Maximum tetrabenazine dose is 50mg/day when used with a strong CYP2D6 inhibitor. *Risk D: Consider therapy modification*

Theophylline Derivatives: Protease Inhibitors may decrease the serum concentration of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

TraZODone: Protease Inhibitors may increase the serum concentration of TraZODone. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Protease Inhibitors may increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Valproic Acid: Protease Inhibitors may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Voriconazole: Ritonavir may increase the metabolism of Voriconazole. High-dose ritonavir (400 mg every 12 hours) is contraindicated. Use caution with lower doses. *Risk X: Avoid combination*

Warfarin: Ritonavir may decrease the serum concentration of Warfarin. *Risk C: Monitor therapy*

Zidovudine: Protease Inhibitors may decrease the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Food enhances absorption.

Herb/Nutraceutical: St John's wort may decrease ritonavir serum levels. Avoid use.

Monitoring ParametersTriglycerides, cholesterol, CBC, LFTs, CPK, uric acid, basic HIV monitoring, viral load, CD4 count, glucose, serum amylase and lipase

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions or toxicity; (multiple liver enzyme interactions may increase or decrease levels/effects drugs and increase potential for severe toxicity or loss of effectiveness) dosing adjustments may be necessary. A list of medications that should not be used is available in each bottle and patients should be provided with this information. Assess therapeutic response (eg, CD4 count, hepatic function) and adverse reactions at regular intervals during therapy (eg, gastrointestinal disturbance [nausea, vomiting, diarrhea] that can lead to dehydration and weight loss, hyperlipidemia and redistribution of body fat, rash, CNS effects [malaise, insomnia, abnormal thinking], electrolyte imbalance). Caution patients to monitor glucose levels closely; protease inhibitors may cause hyperglycemia or new-onset diabetes. Teach patient proper use (eg, timing of multiple medications and drugs that should not be used concurrently), possible side effects/appropriate interventions (eg, glucose testing [protease inhibitors may cause hyperglycemia; exacerbation or new-onset diabetes], use of barrier contraceptives [protease inhibitors may decrease effectiveness of oral contraceptives]), and adverse symptoms to report.

Monitoring: Lab TestsTriglycerides, cholesterol, LFTs, CBC, CPK, uric acid, viral load, CD4 count, glucose, serum amylase and lipase

Patient EducationYou will be provided with a list of specific medications that should not be used during therapy; do not take any new prescription or over-the-counter medications, or herbal products during therapy (even if they are not on the list) without consulting prescriber. This is not a cure for HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. Take exactly as directed with meals. Mix liquid formulation with chocolate milk or liquid nutritional supplement. Capsules may be stored in refrigerator (do not freeze or expose to excessive heat) or stored at room temperature if used within 30 days. Protect from light. Solution should be stored at room temperature. Do not refrigerate. Maintain adequate hydration (2-3 L/day of fluids), unless instructed to restrict fluid intake. If you miss a dose, take as soon as possible and return to your regular schedule (never take a double dose). Frequent blood tests may be required with prolonged therapy. You may be advised to check your glucose levels (this drug can cause exacerbation or new-onset diabetes). May cause body changes due to redistribution of body fat, facial atrophy, or breast enlargement (normal effects of drug). May cause dizziness, insomnia, abnormal thinking (use caution when driving or engaging in potentially hazardous tasks until response to drug is known); nausea, vomiting, or taste perversion (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); muscle weakness (consult prescriber for approved analgesic); or headache (consult prescriber for medication). Inform prescriber if you experience muscle numbness or tingling; unresolved persistent vomiting, diarrhea, or abdominal pain; respiratory difficulty or chest pain; unusual skin rash; or change in color of stool or urine. or any persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Effectiveness of oral contraceptives may be decreased, use of alternative (nonhormonal) forms of contraception is recommended, consult prescriber for appropriate measures.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, soft gelatin:

Norvir®: 100 mg [contains ethanol and polyoxyl 35 castor oil]

Solution:

Norvir®: 80 mg/mL (240 mL) [contains ethanol, polyoxyl 35 castor oil, and propylene glycol; peppermint and caramel flavor]

Generic AvailableNo

ManufacturerAbbott Laboratories (Pharmaceutical Product Division)

Pricing: U.S. (www.drugstore.com)

Capsules (Norvir)

100 mg (30): $289.99

Solution (Norvir)

80 mg/mL (240): $1507.54

Mechanism of ActionRitonavir inhibits HIV protease and renders the enzyme incapable of processing the gag-pol polyprotein precursor which leads to production of noninfectious immature HIV particles

Pharmacodynamics/Kinetics

Absorption: Variable; increased with food

Distribution: High concentrations in serum and lymph nodes; V_d: 0.16-0.66 L/kg

Protein binding: 98% to 99%

Metabolism: Hepatic via CYP3A4 and 2D6; five metabolites, low concentration of an active metabolite (M-2) achieved in plasma (oxidative)

Half-life elimination: 3-5 hours

Time to peak, plasma: Oral solution: 2 hours (fasted); 4 hours (nonfasted)

Excretion: Urine (~11%; ~4% as unchanged drug); feces (~86%; ~34% as unchanged drug)

Pharmacotherapy PearlsPotential compliance problems, frequency of administration and adverse effects should be discussed with patients before initiating therapy to help prevent the emergence of resistance.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause abnormal dreams, agitation, amnesia, aphasia, confusion, depersonalization, emotional lability, euphoria, hallucinations, mania, nervousness, and sleep disturbances

Mental Health: Effects on Psychiatric TreatmentContraindicated with pimozide, midazolam, and triazolam (may use temazepam or lorazepam). Concomitant use of ritonavir and St John's wort is not recommended. Coadministration of protease inhibitors (ritonavir) with St John's wort is expected to substantially decrease protease inhibitor serum concentrations leading to a loss of virologic response and possible resistance to ritonavir or to the class of protease inhibitors. Ritonavir may increase the levels of many antidepressants, including TCAs, SSRIs, bupropion, and trazodone. Use cautiously and monitor closely for adverse effects.

Ritonavir oral solution contains alcohol and can produce a disulfiram-like reaction when coadministered with disulfiram. Ritonavir affects anticonvulsants in opposite directions depending on the anticonvulsants. Ritonavir may increase levels of carbamazepine, clonazepam, and ethosuximide with concomitant use while combined use with divalproex, lamotrigine and phenytoin may result in lower serum concentrations. Be mindful of the anticonvulsant used. A dose increase or decrease may be needed. Check serum levels, and monitor for adverse reactions.

A dose decrease may be needed when coadministered with antipsychotics (includes perphenazine, risperidone, thioridazine); sedative/hypnotics (includes buspirone, clorazepate, diazepam, estazolam, flurazepam, and zolpidem); and stimulants (includes methamphetamine). Monitor for dose-dependent adverse reactions.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Rituximab: Additional Report of Progressive Multifocal Leukoencephalopathy (PML) - September 2008

In conjunction with the U.S. Food and Drug Administration (FDA), Genentech, Inc has issued a “Dear Healthcare Professional” letter informing of an additional case of fatal PML, reported in a patient who had received rituximab for the treatment of rheumatoid arthritis (RA). In this case, PML was diagnosed 18 months after the last rituximab dose; confounding factors include a long history of immunosuppressant therapy and treatment with a tumor necrosis factor (TNF) antagonist for RA, plus development of oropharyngeal cancer (subsequently treated with chemotherapy and radiation therapy [after rituximab therapy, but 9 months prior to the diagnosis of PML]).

PML has previously been associated with rituximab use, although previous reports were confined to patients treated for hematologic malignancies and an unapproved use, systemic lupus erythematosus (SLE). The product labeling, which previously contained warnings regarding PML, has been updated to reflect this new report. Any new-onset neurological changes should be evaluated promptly; consider neurology consultation, brain MRI, and lumbar puncture for suspected PML. Discontinue rituximab in patients who develop PML; consider reduction/discontinuation of concurrent chemotherapy or immunosuppressants.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Rituxan

Medication Safety Issues

Sound-alike/look-alike issues:

Rituxan® may be confused with Remicade®

RiTUXimab may be confused with inFLIXimab

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

The rituximab dose for rheumatoid arthritis is a flat dose (1000 mg) and is not based on body surface area (BSA).

Pronunciation(ri TUK si mab)

U.S. Brand NamesRituxan®

Canadian Brand NamesRituxan®

Pharmacologic CategoryAntineoplastic Agent, Monoclonal Antibody; Antirheumatic, Miscellaneous; Monoclonal Antibody

Use: Labeled IndicationsTreatment of low-grade or follicular CD20-positive, B-cell non-Hodgkin's lymphoma (NHL); treatment of diffuse large B-cell CD20-positive NHL; treatment of moderately- to severely-active rheumatoid arthritis (RA) in combination with methotrexate

Use: Unlabeled/InvestigationalTreatment of autoimmune hemolytic anemia (AIHA) in children; chronic immune thrombocytopenic purpura (ITP); chronic lymphocytic leukemia (CLL); small lymphocytic lymphoma (SLL); pemphigus vulgaris, Waldenström’s macroglobulinemia (WM); treatment of systemic autoimmune diseases (other than rheumatoid arthritis); treatment of refractory chronic graft-versus-host disease (GVHD)

Dosing: AdultsRefer to individual protocols: **Note:** Pretreatment with acetaminophen and an antihistamine is recommended.

NHL (relapsed/refractory, low-grade or follicular CD20-positive, B-cell): 375 mg/m^2 once weekly for 4 or 8 doses

Retreatment following disease progression: 375 mg/m^2 once weekly for 4 doses

NHL (diffuse large B-cell): 375 mg/m^2 given on day 1 of each chemotherapy cycle for up to 8 doses

NHL (follicular, CD20-positive, B-cell, previously untreated): 375 mg/m^2 given on day 1 of each chemotherapy cycle for up to 8 doses

NHL (nonprogressing, low-grade, CD20-positive, B-cell, after first line CVP): 375 mg/m^2 once weekly for 4 doses every 6 months for up to 4 cycles (initiate after 6-8 cycles of chemotherapy are completed)

Rheumatoid arthritis: 1000 mg on days 1 and 15 in combination with methotrexate

Note: Premedication with a corticosteroid (eg, methylprednisolone 100 mg I.V.) 30 minutes prior to each rituximab dose is recommended. In clinical trials, patients received oral corticosteroids on a tapering schedule from baseline through day 16.

CLL/SLL (unlabeled use): 100 mg day 1, then 375 mg/m^2 3 times/week for 11 doses

Refractory pemphigus vulgaris (unlabeled use): 375 mg/m^2 once weekly of weeks 1, 2, and 3 of a 4-week cycle, repeat for 1 additional cycle, then 1 dose per month for 4 months (total of 10 doses in 6 months)

Refractory chronic GVHD, Waldenström's macroglobulinemia (unlabeled uses): 375 mg/m^2 once weekly for 4 weeks

Combination therapy with ibritumomab: 250 mg/m^2 I.V. day 1; repeat in 7-9 days with ibritumomab (also see Ibritumomab monograph):

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Note:** Pretreatment with acetaminophen and an antihistamine is recommended.

AIHA, chronic ITP (unlabeled uses): I.V.: 375 mg/m^2 once weekly for 2-4 doses

Dosing: Combination Regimens

Leukemia, chronic lymphocytic:

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Do **not** administer I.V. push or bolus.

Initial infusion: Start rate of 50 mg/hour; if there is no reaction, increase the rate by 50 mg/hour increments every 30 minutes, to a maximum rate of 400 mg/hour.

Subsequent infusions: If patient did not tolerate initial infusion follow initial infusion guidelines. If patient tolerated initial infusion, start at 100 mg/hour; if there is no reaction, increase the rate by 100 mg/hour increments every 30 minutes, to a maximum rate of 400 mg/hour.

Note: If a reaction occurs, slow or stop the infusion. If the reaction abates, restart infusion at 50% of the previous rate.

In patients with NHL who are receiving a corticosteroid as part of their combination chemotherapy regimen and after tolerance has been established at the recommended infusion rate in cycle 1, a rapid infusion rate has been used beginning with cycle 2. The daily corticosteroid, acetaminophen, and diphenhydramine are administered prior to treatment, then the rituximab dose is administered over 90 minutes, with 20% of the dose administered in the first 30 minutes and the remaining 80% is given over 60 minutes (Sehn, 2007).

Administration: I.V. DetailDiscontinue infusions in the event of serious or life-threatening cardiac arrhythmias.

pH: 6.5

StorageStore vials under refrigeration at 2°C to 8°C (36°F to 46°F); do not freeze. Do not shake. Protect vials from direct sunlight. Solutions for infusion are stable at 2°C to 8°C (36°F to 46°F) for 24 hours and at room temperature for an additional 24 hours.
ReconstitutionWithdraw necessary amount of rituximab and dilute to a final concentration of 1-4 mg/mL with 0.9% sodium chloride or 5% dextrose in water. Gently invert the bag to mix the solution. Do not shake.
RestrictionsAn FDA-approved medication guide is available; distribute to each patient to whom this medication is dispensed.
ContraindicationsThere are no contraindications listed in the manufacturer's labeling.
Warnings/Precautions

Boxed warnings:

- Infusion reactions: See "Concerns related to adverse effects" below.

- Mucocutaneous reactions: See "Concerns related to adverse effects" below.

- Progressive multifocal leukoencephalopathy: See "Concerns related to adverse effects" below.

- Tumor lysis syndrome: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Bowel obstruction/perforation: Have been reported, with an average onset of symptoms of ~6 days; complaints of abdominal pain should be evaluated, especially if early in the treatment course.

- Infusion reactions: **[U.S. Boxed Warning]: Severe (occasionally fatal) infusion-related reactions have been reported, usually with the first infusion; fatalities have been reported within 24 hours of infusion; monitor closely and discontinue with grades 3 or 4 infusion reactions.** Reactions usually occur within 30-120 minutes and may include hypotension, angioedema, bronchospasm, hypoxia, urticaria, and in more severe cases pulmonary infiltrates, acute respiratory distress syndrome, myocardial infarction, ventricular fibrillation, cardiogenic shock, and/or anaphylaxis. Risk factors associated with fatal outcomes include chronic lymphocytic leukemia, female gender, mantle cell lymphoma, or pulmonary infiltrates. Closely monitor patients with a history of prior cardiopulmonary reactions or with pre-existing cardiac or pulmonary conditions and patients with high numbers of circulating malignant cells (>25,000/mm^3). Discontinue infusion for severe reactions and serious or life-threatening cardiac arrhythmias; subsequent doses should include cardiac monitoring during and after the infusion. Medications for the treatment of hypersensitivity reactions (eg, bronchodilators, epinephrine, antihistamines, corticosteroids) should be available for immediate use; treatment is symptomatic. Mild-to-moderate infusion-related reactions (eg, chills, fever, rigors) occur frequently and are typically managed through slowing or interrupting the infusion. Infusion may be resumed at a 50% infusion rate reduction upon resolution of symptoms. Due to the potential for hypotension, consider withholding antihypertensives 12 hours prior to treatment.

- Mucocutaneous reactions: **[U.S. Boxed Warning]: Severe and sometimes fatal mucocutaneous reactions (lichenoid dermatitis, paraneoplastic pemphigus, Stevens-Johnson syndrome, toxic epidermal necrolysis and vesiculobullous dermatitis) have been reported,** occurring from 1-13 weeks following exposure. Discontinue in patients experiencing severe mucocutaneous skin reactions; the safety of re-exposure following mucocutaneous reactions has not been evaluated.

- Progressive multifocal leukoencephalopathy: **[U.S. Boxed Warning]: Progressive multifocal leukoencephalopathy (PML) due to JC virus infection has been reported with rituximab use.** Cases were reported in patients with hematologic malignancies receiving rituximab either with combination chemotherapy, or with hematopoietic stem cell transplant. Cases were also reported in patients receiving rituximab for autoimmune diseases who had received concurrent or prior immunosuppressant therapy. Onset may be delayed, although most cases were diagnosed within 12 months of the last rituximab dose. Evaluate any neurological change promptly; consider neurology consultation, brain MRI and lumbar puncture for suspected PML. Discontinue rituximab in patients who develop PML; consider reduction/discontinuation of concurrent chemotherapy or immunosuppressants.

- Renal toxicity: May cause renal toxicity in patients with hematologic malignancies; consider discontinuation with increasing serum creatinine or oliguria.

- Tumor lysis syndrome: **[U.S. Boxed Warning]: Tumor lysis syndrome leading to acute renal failure requiring dialysis may occur 12-24 hours following the first dose.** Hyperkalemia, hypocalcemia, hyperuricemia, and/or hyperphosphatemia may occur. Consider prophylaxis (allopurinol, hydration) in patients at high risk (high numbers of circulating malignant cells ≥25,000/mm^3 or high tumor burden).

- Viral infections: Rarely, reactivation of hepatitis B (with fulminant hepatitis and hepatic failure) has been reported in association with use; screen high-risk patients prior to therapy initiation. Other serious and potentially fatal viral infections, either new or reactivated, associated with use include cytomegalovirus, herpes simplex virus, parvovirus B19, varicella zoster virus, West Nile virus, and hepatitis C. Viral infections may be delayed; occurring up to 1 year after discontinuation of therapy.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with pre-existing cardiovascular disease or prior cardiopulmonary events.

- Respiratory disease: Use with caution in patients with pre-existing pulmonary disease, or prior cardiopulmonary events.

Concurrent drug therapy issues:

- Biologic agents: Safety and efficacy of rituximab in combination with biologic agents have not been established.

- Disease-modifying antirheumatic drugs (DMARD): Safety and efficacy of rituximab in combination DMARD other than methotrexate have not been established.

- Immunizations: Live vaccines should not be given concurrently with rituximab; there is no data available concerning secondary transmission of live vaccines with or following rituximab treatment. RA patients should be brought up to date with nonlive immunizations (following current guidelines) before initiating therapy; evaluate risks of therapy delay versus benefit (of nonlive vaccines) for NHL patients.

Special populations:

- Elderly: Use with caution in the elderly; higher risk of cardiac (supraventricular arrhythmia) and pulmonary adverse events (pneumonia, pneumonitis).

- Pediatrics: Not approved for use in children.

- Rheumatoid arthritis (RA) patients: Monitor closely RA patients during and after each infusion; increased risk of cardiovascular events. Safety and efficacy of retreatment for RA have not been established.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have demonstrated adverse effects including decreased (reversible) B-cells and immunosuppression. There are no adequate and well-controlled studies in pregnant women. IgG molecules are known to cross the placenta (rituximab is an engineered IgG molecule) and rituximab has been detected in the serum of infants exposed *in utero*. B-Cell lymphocytopenia lasting <6 months may occur in exposed infants. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if rituximab is excreted in human milk. However, human IgG is excreted in breast milk, and therefore, rituximab may also be excreted in milk. The manufacturer recommends discontinuing breast-feeding until circulating levels of rituximab are no longer detectable.

Adverse Reactions**Note:** Patients treated with rituximab for rheumatoid arthritis (RA) may experience fewer adverse reactions.

>10%:

Central nervous system: Fever (5% to 53%), chills (3% to 33%), headache (19%), pain (12%)

Dermatologic: Rash (15%; grades 3/4: 1%), pruritus (5% to 14%), angioedema (11%; grades 3/4: 1%)

Gastrointestinal: Nausea (8% to 23%), abdominal pain (2% to 14%)

Hematologic: Cytopenias (grades 3/4: ≤48%; may be prolonged), lymphopenia (48%; grades 3/4: 40%; median duration 14 days), leukopenia (14%; grades 3/4: 4%), neutropenia (14%; grades 3/4: 6%; median duration 13 days), thrombocytopenia (12%; grades 3/4: 2%)

Neuromuscular & skeletal: Weakness (2% to 26%)

Respiratory: Cough (13%), rhinitis (3% to 12%)

Miscellaneous: Infusion-related reactions (lymphoma: first dose 77%; decreases with subsequent infusions; may include angioedema, bronchospasm, chills, dizziness, fever, headache, hyper-/hypotension, myalgia, nausea, pruritus, rash, rigors, urticaria, and vomiting; reactions reported are lower [first infusion: 32%] in RA); infection (31%; grades 3/4: 4%; bacterial: 19%; viral 10%; fungal: 1%), night sweats (15%)

1% to 10%:

Cardiovascular: Hypotension (10%), peripheral edema (8%), hypertension (6% to 8%), flushing (5%), edema (<5%)

Central nervous system: Dizziness (10%), anxiety (2% to 5%), agitation (<5%), depression (<5%), hypoesthesia (<5%), insomnia (<5%), malaise (<5%), nervousness (<5%), neuritis (<5%), somnolence (<5%), vertigo (<5%), migraine (RA: 2%)

Dermatologic: Urticaria (2% to 8%)

Endocrine & metabolic: Hyperglycemia (9%), hypoglycemia (<5%), hypercholesterolemia (2%)

Gastrointestinal: Diarrhea (10%), vomiting (10%), dyspepsia (3%), anorexia (<5%), weight loss (<5%)

Hematologic: Anemia (8%; grades 3/4: 3%)

Local: Pain at the injection site (<5%)

Neuromuscular & skeletal: Back pain (10%), myalgia (10%), arthralgia (6% to 10%), paresthesia (2%), arthritis (<5%), hyperkinesia (<5%), hypertonia (<5%), neuropathy (<5%)

Ocular: Conjunctivitis (<5%), lacrimation disorder (<5%)

Respiratory: Throat irritation (2% to 9%), bronchospasm (8%), dyspnea (7%), upper respiratory tract infection (RA: 7%), sinusitis (6%)

Miscellaneous: LDH increased (7%)

Postmarketing and/or case reports: Acute renal failure, anaphylactoid reaction/anaphylaxis, angina, aplastic anemia, ARDS, arrhythmia, bowel obstruction, bronchiolitis obliterans, cardiac failure, cardiogenic shock, disease progression (Kaposi's sarcoma), fatal infusion-related reactions, fulminant hepatitis, gastrointestinal perforation, hemolytic anemia, hepatic failure, hepatitis, hepatitis B reactivation, hyperviscosity syndrome (in Waldenström's macroglobulinemia), hypogammaglobulinemia, hypoxia, interstitial pneumonitis, lichenoid dermatitis, lupus-like syndrome, marrow hypoplasia, MI, neutropenia (late-onset occurring >40 days after last dose), optic neuritis, pancytopenia (prolonged), paraneoplastic pemphigus (uncommon), pleuritis, pneumonia, pneumonitis, polyarticular arthritis, progressive multifocal leukoencephalopathy (PML), pure red cell aplasia, renal toxicity, serum sickness, Stevens-Johnson syndrome, supraventricular arrhythmia, systemic vasculitis, toxic epidermal necrolysis, tumor lysis syndrome, urticaria, uveitis, vasculitis with rash, ventricular fibrillation, ventricular tachycardia, vesiculobullous dermatitis, viral reactivation (includes JC virus, cytomegalovirus, herpes simplex virus, parvovirus B19, varicella zoster virus, West Nile virus, and hepatitis C)

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Abciximab: May enhance the potential for allergic or hypersensitivity reactions to Monoclonal Antibodies. Also may cause thrombocytopenia or diminished therapeutic effects. *Risk C: Monitor therapy*

Antihypertensives: May enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid echinacea (may diminish the therapeutic effect of immunosuppressants). Avoid hypoglycemic herbs, including alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, and stinging nettle (may enhance the hypoglycemic effect of rituximab).

Monitoring ParametersCBC with differential and platelets, peripheral $CD20^+$ cells; HAMA/HACA titers (high levels may increase the risk of allergic reactions); renal function, fluid balance; vital signs; monitor for infusion reactions, cardiac monitoring during and after infusion in rheumatoid arthritis patients and in patients with pre-existing cardiac disease or if arrhythmias develop during or after subsequent infusions

Screen for hepatitis B in high-risk patients prior to initiation of rituximab therapy (the NCCN NHL guidelines recommend screening **all** NHL patients prior to therapy). In addition, carriers and patients with evidence of recovery from prior hepatitis B infection should be monitored closely for clinical and laboratory signs of HBV infection during therapy and for up to a year following completion of treatment. High-risk patients should be screened for hepatitis C (per NCCN guidelines).

Complaints of abdominal pain, especially early in the course of treatment, should prompt a thorough diagnostic evaluation and appropriate treatment. Signs or symptoms of progressive multifocal leukoencephalopathy (focal neurologic deficits, which may present as hemiparesis, visual field deficits, cognitive impairment, aphasia, ataxia, and/or cranial nerve deficits). If PML is suspected, obtain brain MRI scan and lumbar puncture.

Nursing: Physical Assessment/MonitoringAssess patient history with mouse antibodies prior to beginning therapy. Assess other pharmacological or herbal products patient may be taking for potential interactions (eg, anything that may increase hypotensive effects of this drug). Evaluate results of laboratory tests prior to, during, and following therapy. Patient must be monitored closely during and following each infusion; severe infusion reactions can occur. Pretreatment with acetaminophen and diphenhydramine is recommended (corticosteroid when used to treat RA). Emergency equipment and medications (epinephrine, antihistamines, corticosteroids) should be immediately available during infusion. In the event of severe infusion reaction, infusion should be stopped and prescriber notified immediately. Evaluate patient response closely after each dose and following discontinuation of therapy (eg, abdominal pain [bowel obstruction and perforation], hyper-/hypertension, CNS changes, hyper-/hypoglycemia, rash); bowel obstruction and perforation can occur early in therapy; acute tumor lysis syndrome leading to acute renal failure can occur 12-24 hours after first dose; severe mucocutaneous reactions can occur from 1-13 weeks following treatment; and new or reactivated serious viral infection may occur up to one year following discontinuation of therapy. Teach patient possible side effects/appropriate interventions and importance of reporting adverse reactions.

Monitoring: Lab TestsCBC with differential and platelets, peripheral CD20+ cells. Patients with elevated HAMA/HACA titers may have an allergic reaction when treated with rituximab or other antibodies from a mouse genetic source.

Patient EducationThis medication is only administered by infusion. You may experience a reaction during the infusion of this medication, including high fever, chills, respiratory difficulty, or congestion. You will be closely monitored and comfort measures provided. Maintain adequate hydration (2-3 L/day of fluids during entire course of therapy) unless instructed to restrict fluid intake. You will be susceptible to infection and people may wear masks and gloves while caring for you to protect you as much as possible (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). If you have diabetes, monitor glucose levels closely; this medication may impact glucose control. May cause dizziness or trembling (use caution until response to medication is known); nausea, vomiting, or loss of appetite (small, frequent meals and frequent mouth care may help); diarrhea (increase dietary fiber, buttermilk, or yogurt); bone or muscle pain (ask prescriber for appropriate analgesic). Report immediately any unusual abdominal pain; skin rash or redness, persistent dizziness, swelling of extremities, unusual weight gain, respiratory difficulty, chest pain or tightness; symptoms of respiratory infection (wheezing, bronchospasms, or difficulty breathing); unresolved GI disturbance (nausea, vomiting); opportunistic infection (sore or irritated throat; unusual and persistent fatigue, chills, fever, unhealed sores, white plaques in mouth or genital area; unusual bruising or bleeding); CNS changes (confusion, agitation, insomnia); pain, tingling, loss of sensation in extremities, or loss of coordination); or other unusual effects related to this medication. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Rituxan®: 10 mg/mL (10 mL, 50 mL) [contains polysorbate 80]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Concentrate (Rituxan)

10 mg/mL (10): $616.44

Mechanism of ActionRituximab is a monoclonal antibody directed against the CD20 antigen on B-lymphocytes. CD20 regulates cell cycle initiation; and, possibly, functions as a calcium channel. Rituximab binds to the antigen on the cell surface, activating complement-dependent B-cell cytotoxicity; and to human Fc receptors, mediating cell killing through an antibody-dependent cellular toxicity. B-cells are believed to play a role in the development and progression of rheumatoid arthritis. Signs and symptoms of RA are reduced by targeting B-cells and the progression of structural damage is delayed.

Pharmacodynamics/Kinetics

Duration: Detectable in serum 3-6 months after completion of treatment; B-cell recovery begins ~6 months following completion of treatment; median B-cell levels return to normal by 12 months following completion of treatment

Absorption: I.V.: Immediate and results in a rapid and sustained depletion of circulating and tissue-based B cells

Distribution: 4.3 L (following two 1000 mg doses for rheumatoid arthritis)

Half-life elimination:

Cancer: Proportional to dose; wide ranges reflect variable tumor burden and changes in CD20 positive B-cell populations with repeated doses:

>100 mg/m^2: 4.4 days (range 1.6-10.5 days)

375 mg/m^2:

Following first dose: Mean half-life: 3.2 days (range 1.3-6.4 days)

Following fourth dose: Mean half-life: 8.6 days (range 3.5-17 days)

RA: Mean terminal half-life: 19 days

Excretion: Uncertain; may undergo phagocytosis and catabolism in the reticuloendothelial system (RES)

Rivaroxaban

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(riv a ROX a ban)
Canadian Brand NamesXarelto®
Pharmacologic CategoryFactor Xa Inhibitor
Use: Labeled IndicationsPostoperative thromboprophylaxis in patients who have undergone total hip or knee replacement procedures
Dosing: Adults **Note:** Therapy should not be initiated until hemostasis has been established.

Postoperative thromboprophylaxis: Oral:

Knee replacement: 10 mg once daily; initial dose should be administered within 6-10 hours after completion of surgery and establishment of hemostasis (total duration of therapy: 14 days)

Hip replacement: 10 mg once daily; initial dose should be administered within 6-10 hours after completion of surgery and establishment of hemostasis (total duration of therapy: 35 days)

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal Impairment
Moderate renal impairment (Cl_{cr} 30-49 mL/minute): Use with caution; no specific dosage adjustments are specified in approved labeling.

Severe renal impairment (Cl_{cr} <30 mL/minute): Use not recommended.

Dosing: Hepatic Impairment
Mild hepatic impairment: Manufacturer provides no specific dosing recommendations in approved labeling. Limited data indicates pharmacokinetics and pharmacodynamic response were similar to healthy subjects.

Significant hepatic impairment (including Child-Pugh classes B and C): Use is contraindicated.

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered without regard to meals.
Dietary ConsiderationsMay be taken without regard to meals.
StorageStore at 15°C to 30°C (59°F to 86°F).
RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to rivaroxaban or any component of the formulation; hepatic disease (including Child-Pugh classes B and C) associated with coagulopathy and clinically relevant bleeding risk; clinically significant active bleeding, including hemorrhagic manifestations and bleeding diathesis; lesions at increased risk of clinically significant bleeding (eg, hemorrhagic or ischemic cerebral infarction) within previous 6 months; spontaneous hemostasis impairment; concomitant systemic treatment with strong CYP3A4 and P-glycoprotein (P-gp) inhibitors; pregnancy; lactation
Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: The most common complication is bleeding. Certain patients are at increased risk of bleeding; risk factors include bacterial endocarditis, congenital or acquired bleeding disorders, vascular retinopathy, thrombocytopenia, recent puncture of large vessels or organ biopsy, stroke, intracerebral surgery, or other neuraxial procedure, severe uncontrolled hypertension, renal impairment, recent major surgery, recent major bleeding (intracranial, GI, intraocular, or pulmonary). Monitor for signs and symptoms of bleeding (weakness, dizziness, unexplained edema). Prompt clinical evaluation is warranted with any unexplained decrease in hemoglobin or blood pressure.

Disease-related concerns:

- Hepatic impairment: Use in significant hepatic dysfunction was not evaluated during clinical trials. Use is contraindicated in hepatic dysfunction (including Child-Pugh classes B and C) associated with coagulopathy and clinically significant risk of bleeding. Limited data in patients with mild hepatic dysfunction without coagulopathy suggests use may be appropriate.

- Renal impairment: Use caution in patients with moderate renal impairment (Cl_{cr} 30-49 mL/minute) including patients receiving concomitant drug therapy that may increase rivaroxaban systemic exposure and those with deteriorating renal function. Use in severe renal impairment (Cl_{cr} <30 mL/minute) has not been studied and is not recommended. Discontinue use with onset of acute renal failure.

Concurrent drug therapy issues:

- Anticoagulants and antiplatelet agents: Due to an increased risk of bleeding, avoid use with direct thrombin inhibitors (eg, bivalirudin), unfractionated heparin or heparin derivatives, low molecular weight heparins (eg, enoxaparin), aspirin, coumarin derivatives, and sulfinpyrazone. NSAIDs and other platelet aggregation inhibitors (eg, clopidogrel) should be used cautiously.

- CYP3A4 inducers: Use with strong CYP3A4 inducers with caution; monitor for decreased levels/effects of rivaroxaban.

- CYP3A4/P-gp inhibitors: Concomitant use with strong inhibitors of both CYP3A4 and P-gp is contraindicated.

Special populations:

- Patients <50 kg: Use with caution; rivaroxaban maximum concentration (C_{max}) increased by 24% and PT prolongation effect increased by ~20% in this patient population.

- Pediatrics: Safety and efficacy have not been established in patients <18 years of age.

Dosage form specific issues:

- Lactose intolerance: Formulation contains lactose; use is not recommended in patients with lactose or galactose intolerance (eg, Lapp lactase deficiency, glucose-galactose malabsorption).

Other warnings/precautions:

- Neuraxial anesthesia: If possible, avoid use in patients undergoing anesthesia with postoperative indwelling epidural catheters. Hematomas (spinal or epidural) resulting in extended or permanent paralysis may occur. Avoid removal of epidural catheter for at least 18 hours following last rivaroxaban dose. Avoid rivaroxaban administration for at least 6 hours following epidural catheter removal. Monitor for signs of neurologic impairment (eg, numbness/weakness of legs, bowel/bladder dysfunction); prompt diagnosis and treatment are necessary.

Pregnancy ConsiderationsUse is contraindicated in pregnancy.

LactationUse is contraindicated.

Adverse Reactions

1% to 10%:

Gastrointestinal: Nausea (1%)

Hematologic: Bleeding: Major: (<1% to 2%, includes surgical site bleeding events with decreased hemoglobin or transfusion); Nonmajor: (4% to 7%), anemia (1%)

Hepatic: Transaminases increased (2%; ALT >3 X upper limit of normal [ULN] 2% to 6%), GGT increased (1%)

<1%, postmarketing, and/or case reports: Abdominal pain, alkaline phosphatase increased, allergic dermatitis, amylase increased, bilirubin increased, BUN increased, constipation, creatinine increased, diarrhea, dizziness, dyspepsia, ecchymosis, fatigue, fever, headache, hematuria, hypersensitivity, hypotension, jaundice, LDH increased, lipase increased, pain, peripheral edema, pruritus, rash, syncope, tachycardia, thrombocythemia, urticaria, vomiting, weakness, xerostomia

Drug Interactions

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Erythromycin: May increase the serum concentration of Rivaroxaban. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ibritumomab: Anticoagulants may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of Rivaroxaban. **Exceptions:** Erythromycin. *Risk X: Avoid combination*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Thrombolytic Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Anticoagulants may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse effects may be increased. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Grapefruit juice may increase levels/effects of rivaroxaban; use caution.

Herb/Nutraceutical: Avoid St John's wort (may decrease levels/effects of rivaroxaban; avoid concomitant use if possible; use with caution if concomitant use can not be avoided).

Test InteractionsProlongs activated partial thromboplastin time (aPTT), HepTest®, and Russell viper venom time

Monitoring ParametersProthrombin time (PT), CBC with differential, renal function, hepatic function; **Note:** In clinical trials, monitoring of aPTT, PT/INR, or antifactor Xa levels did not occur. However, certain patient populations (eg, renal insufficiency, hepatic impairment, low body weight, extreme obesity) may require monitoring of the PT time).

Nursing: Physical Assessment/MonitoringMonitor for unusual bleeding. Invasive procedures should be avoided if possible. Assess other prescription and OTC medications the patient may be taking to avoid duplications and interactions. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Monitoring: Lab TestsProthrombin time (PT), CBC with differential, renal function, hepatic function

Patient EducationLimit intake of grapefruit juice. Do not take any new medications without consulting prescriber. You may be prone to bleeding while taking this medication. Brush teeth with a soft brush, use waxed dental floss and an electric razor, and use extra care when using scissors or sharp knives and utensils. Report unusual bleeding or bruising; blood in stool, vomitus, or urine; nosebleeds; bleeding gums; or unusual pain, especially in joints or back. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Use during pregnancy is not recommended. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet:

Xarelto® [CAN]: 10 mg [contains lactose] [not available in U.S.]

Generic AvailableNo

ManufacturerBayer Inc, Canada

Mechanism of ActionInhibits platelet activation and fibrin clot formation via direct, selective and reversible inhibition of factor Xa (FXa) in both the intrinsic and extrinsic coagulation pathways. FXa, as part of the prothrombinase complex consisting also of factor Va, calcium ions, factor II and phospholipid, catalyzes the conversion of prothrombin to thrombin. Thrombin both activates platelets and catalyzes the conversion of fibrinogen to fibrin.

Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: V_{dss}: ~50 L

Protein binding: 92% to 95% (primarily to albumin)

Metabolism: Hepatic via CYP3A4, CYP3A5, and CYP2J2

Bioavailability: Absolute bioavailability: ~100%

Half-life elimination: Young individual: 5-9 hours; Elderly: 11-13 hours

Time to peak, plasma: 2-4 hours

Excretion: Urine (33% as unchanged drug; 33% as inactive metabolites); feces (33% as inactive metabolites)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Surgical site bleeding may occur.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Rivastigmine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ri va STIG meen)

U.S. Brand NamesExelon®

Canadian Brand NamesExelon®

Pharmacologic CategoryAcetylcholinesterase Inhibitor (Central)

Use: Labeled IndicationsTreatment of mild-to-moderate dementia associated with Alzheimer's disease or Parkinson's disease

Use: Unlabeled/InvestigationalSevere dementia associated with Alzheimer's disease; Lewy body dementia

Dosing: Adults**Note:** Exelon® oral solution and capsules are bioequivalent.

Mild-to-moderate Alzheimer's dementia:

Oral: Initial: 1.5 mg twice daily; may increase by 3 mg/day (1.5 mg/dose) every 2 weeks based on tolerability (maximum recommended dose: 6 mg twice daily)

Note: If GI adverse events occur, discontinue treatment for several doses then restart at the same or next lower dosage level; antiemetics have been used to control GI symptoms. If treatment is interrupted for longer than several days, restart the treatment at the lowest dose and titrate as previously described.

Transdermal patch: Initial: 4.6 mg/24 hours; if well tolerated, may be increased (after at least 4 weeks) to 9.5 mg/24 hours (recommended effective dose). Maintenance: 9.5 mg/24 hours (maximum dose: 9.5 mg/24 hours).

Note: If intolerance is noted (nausea, vomiting), patch should be removed and treatment interrupted for several days and restarted at the same or lower dosage. If interrupted for more than several days, reinitiate at lowest dosage and increase to maintenance dose after 4 weeks.

Conversion from oral therapy: If oral daily dose <6 mg, switch to 4.6 mg/24 hours patch; if oral daily dose 6-12 mg, switch to 9.5 mg/24 hours patch. Apply patch on the next day following last oral dose.

Mild-to-moderate Parkinson's-related dementia:

Oral: Initial: 1.5 mg twice daily; may increase by 3 mg/day (1.5 mg/dose) every 4 weeks based on tolerability (maximum recommended dose: 6 mg twice daily)

Transdermal patch: See transdermal dosing for Alzheimer's dementia.

Dosing: ElderlyFollowing oral administration, clearance is significantly lower in patients >60 years of age, but dosage adjustments are not recommended. Age was not associated with exposure in patients treated transdermally. Titrate dose to individual's tolerance. Refer to adult dosing.

Dosing: Renal ImpairmentDosage adjustments are not recommended, however, titrate the dose to the individual's tolerance.

Dosing: Hepatic ImpairmentClearance is significantly reduced in mild to moderately impaired patients. Although dosage adjustments are not recommended, use lowest possible dose and titrate according to individual's tolerance. Consider intervals of >2 weeks between dosage adjustments.

Administration: OralShould be administered with meals (breakfast or dinner). Capsule should be swallowed whole. Liquid form is available for patients who cannot swallow capsules (can be swallowed directly from syringe or mixed with water, soda, or cold fruit juice). Stir well and drink within 4 hours of mixing.

Administration: TopicalTransdermal patch: Apply transdermal patch to upper or lower back (alternatively, may apply to upper arm or chest). Avoid reapplication to same spot of skin for 14 days (may rotate sections of back, for example). Do not apply to red, irritated, or broken skin. Avoid areas of recent application of lotion or powder. After removal, fold patch to press adhesive surfaces together, and discard. Avoid eye contact; wash hands after handling patch. Replace patch every 24 hours. Avoid exposing the patch to external sources of heat (eg, sauna, excessive light) for prolonged periods of time.

Dietary ConsiderationsCapsules should be taken with meals.

Storage

Oral: Store at 15°C to 30°C (59°F to 86°F); do not freeze. Store solution in an upright position.

Transdermal patch: Store at 15°C to 30°C (59°F to 86°F). Patches should be kept in sealed pouch until use.

ContraindicationsHypersensitivity to rivastigmine, other carbamate derivatives (eg, neostigmine, pyridostigmine, physostigmine), or any component of the formulation

Allergy Considerations

- Cholinesterase Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anorexia/weight loss: Significant anorexia and weight loss are associated with use; occurs more frequently in women and during the titration phase. Monitor weight during therapy.

- Nausea/vomiting: Significant nausea and/or vomiting have been associated with use; occurs more frequently in women and during the titration phase. May be severe, particularly at doses higher than recommended.

- Vagotonic effects: Cholinesterase inhibitors may have vagotonic effects which may cause bradycardia and/or heart block with or without a history of cardiac disease.

Disease-related concerns:

- Cardiac conduction abnormalities: Use with caution in patients with sick-sinus syndrome, bradycardia, or conduction abnormalities. Alzheimer's treatment guidelines consider bradycardia to be a relative contraindication for use of centrally-active cholinesterase inhibitors.

- Peptic ulcer disease: Use with caution in patients at risk of ulcer disease (eg, previous history or NSAID use); may increase gastric acid secretion. Monitor for symptoms of bleeding.

- Respiratory disease: Use with caution in patients with COPD and/or asthma.

- Seizure disorder: Use with caution in patients with a history of seizure disorder.

- Urinary tract obstruction: Use with caution in patients with bladder outlet obstruction or prostatic hyperplasia; cholinomimetics may cause or worsen outflow obstructions, including possible exacerbation of BPH symptoms.

Concurrent drug therapy issues:

- Depolarizing neuromuscular-blocking agents: May exaggerate neuromuscular blockade effects of depolarizing neuromuscular-blocking agents (eg, succinylcholine).

Special populations:

- Low body weight (<50 kg): Use caution due to increased risk of adverse reactions.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Initiation/interruption of therapy: Should be started at lowest dose and titrated; if treatment is interrupted for more than several days, reinstate at the lowest daily dose.

Geriatric ConsiderationsTitrate dose to tolerance.
Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Should be used only if the benefit outweighs the potential risk to the fetus.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions**Note:** Many concentration-related effects are reported at a lower frequency by transdermal route.

>10%:

Central nervous system: Dizziness (2% to 21%), headache (3% to 17%)

Gastrointestinal: Nausea (7% to 47%), vomiting (6% to 31%), diarrhea (5% to 19%), anorexia (3% to 17%), abdominal pain (1% to 13%)

1% to 10%:

Cardiovascular: Syncope (3%), hypertension (3%)

Central nervous system: Fatigue (2% to 9%), insomnia (1% to 9%), confusion (8%), depression (4% to 6%), anxiety (2% to 5%), malaise (5%), somnolence (4% to 5%), hallucinations (4%), aggressiveness (3%), parkinsonism symptoms worsening (2% to 3%), vertigo (≤2%)

Gastrointestinal: Dyspepsia (9%), constipation (5%), flatulence (4%), weight loss (3% to 8%), eructation (2%), dehydration (2%)

Genitourinary: Urinary tract infection (1% to 7%)

Neuromuscular & skeletal: Weakness (2% to 6%), tremor (1%; up to 10% in Parkinson’s patients)

Respiratory: Rhinitis (4%)

Miscellaneous: Diaphoresis (4%), flu-like syndrome (3%)

<1% (Limited to important or life-threatening symptoms; reactions may be at a similar frequency to placebo): Abnormal hepatic function, acute renal failure, albuminuria, allergy, anemia, angina, aphasia, apnea, apraxia, ataxia, atrial fibrillation, AV block, bradycardia, bronchospasm, bundle branch block, cachexia, cardiac arrest, cardiac failure, chest pain, cholecystitis, diplopia, diverticulitis, dysphagia, dyspnea, dysphonia, edema, esophagitis, extrasystoles, fecal incontinence, gastritis, gastroesophageal reflux, GGT increased, glaucoma, hematuria, hot flashes, hyper-/hypoglycemia, hypercholesterolemia, hyper-/hypokinesia, hypertonia, hypokalemia, hyponatremia, hypotension (including postural), hypothermia, hypothyroidism, intestinal obstruction, intracranial hemorrhage, mastitis, MI, migraine, neuralgia, palpitation, pancreatitis, paresthesia, periorbital or facial edema, peripheral ischemia, peripheral neuropathy, pneumonia, pruritus, psychiatric disorders (eg, delirium, depersonalization, psychosis, emotional lability, suicidal ideation or tendencies), rash, retinopathy, rigors, seizure, sick-sinus syndrome, sudden cardiac death, supraventricular tachycardia, thrombocytopenia, thrombophlebitis, thrombosis, transient ischemic attack, ulcerative stomatitis, urinary incontinence, urticaria, vasovagal syncope

Postmarketing and/or case reports: Stevens-Johnson syndrome, severe vomiting with esophageal rupture (following inappropriate reinitiation of dose)

Drug Interactions

Anticholinergics: May diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antipsychotics: Acetylcholinesterase Inhibitors (Central) may enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Beta-Blockers: Acetylcholinesterase Inhibitors may enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Cholinergic Agonists: Acetylcholinesterase Inhibitors may enhance the adverse/toxic effect of Cholinergic Agonists. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Ginkgo Biloba: May enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents (Nondepolarizing): Acetylcholinesterase Inhibitors may diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Succinylcholine: Acetylcholinesterase Inhibitors may enhance the neuromuscular-blocking effect of Succinylcholine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Smoking: Nicotine increases the clearance of rivastigmine by 23%.

Ethanol: Avoid ethanol (due to risk of sedation; may increase GI irritation).

Food: Food delays absorption by 90 minutes, lowers C_{max} by 30% and increases AUC by 30%.

Herb/Nutraceutical: Avoid ginkgo biloba (may increase cholinergic effects).

Monitoring ParametersCognitive function at periodic intervals (MMSE), symptoms of GI intolerance, weight

Nursing: Physical Assessment/MonitoringAssess bladder and sphincter adequacy prior to administering medication. Assess other medications for effectiveness and interactions. Monitor weight, therapeutic effectiveness, and adverse reactions at beginning of therapy and regularly with long-term use. Assess cognitive function at periodic intervals. Assess knowledge/teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis drug is not a cure for Alzheimer's disease, but it may reduce the symptoms. Use as directed; do not increase dose or discontinue without consulting prescriber. Swallow capsule whole with meals (do not crush or chew). Liquid can be swallowed directly from syringe or mixed with water, soda, or cold fruit juice; stir well and drink within 4 hours of mixing. Apply transdermal patch to skin free from redness or irritation. Rotate sites; do not apply to same site within 14 days. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Avoid alcohol. May cause dizziness, drowsiness, or postural hypotension (rise slowly from sitting or lying position and use caution when driving or climbing stairs); vomiting or loss of appetite (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); diarrhea (buttermilk, boiled milk, or yogurt may help); or constipation (increased exercise, fluids, fruit, or fiber may help); or urinary frequency. Report persistent abdominal discomfort, diarrhea, or constipation; significantly increased salivation, sweating, tearing, or urination; chest pain, palpitations, acute headache; CNS changes (eg, excessive fatigue, agitation, insomnia, dizziness, confusion, aggressiveness, depression); increased muscle, joint, or body pain; vision changes or blurred vision; shortness of breath, coughing, or wheezing; skin rash; or other persistent adverse reactions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Exelon®: 1.5 mg, 3 mg, 4.5 mg, 6 mg

Solution, oral:

Exelon®: 2 mg/mL (120 mL) [contains sodium benzoate]

Transdermal system [once-daily patch]:

Exelon®: 4.6 mg/24 hours (30s) [5 cm^2; contains rivastigmine 9 mg]; 9.5 mg/24 hours (30s) [10 cm^2; contains rivastigmine 18 mg]

Generic AvailableNo

ManufacturerNovartis Pharmaceuticals Corp

Pricing: U.S. (www.drugstore.com)

Capsules (Exelon)

1.5 mg (60): $202.18

3 mg (60): $202.07

4.5 mg (60): $203.29

6 mg (60): $202.18

Patch, 24-hour (Exelon)

4.6 mg/24 hrs (30): $199.99

9.5 mg/24 hrs (30): $202.65

Mechanism of ActionA deficiency of cortical acetylcholine is thought to account for some of the symptoms of Alzheimer's disease and the dementia of Parkinson's disease; rivastigmine increases acetylcholine in the central nervous system through reversible inhibition of its hydrolysis by cholinesterase

Pharmacodynamics/Kinetics

Duration: Anticholinesterase activity (CSF): ~10 hours (6 mg oral dose)

Absorption: Oral: Fasting: Rapid and complete within 1 hour

Distribution: V_d: 1.8-2.7 L/kg; penetrates blood-brain barrier (CSF levels are ~40% of plasma levels following oral administration)

Protein binding: 40%

Metabolism: Extensively via cholinesterase-mediated hydrolysis in the brain; metabolite undergoes N-demethylation and/or sulfate conjugation hepatically; CYP minimally involved; linear kinetics at 3 mg twice daily, but nonlinear at higher doses

Bioavailability: Oral: 36% to 40%

Half-life elimination: Oral: 1.5 hours; Transdermal patch: 3 hours (after removal)

Time to peak: Oral: 1 hour; Transdermal patch: 10-16 hours following first dose

Excretion: Urine (97% as metabolites); feces (0.4%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Cardiovascular ConsiderationsBecause of the cholinergic activity due to inhibition of acetylcholinesterase, rivastigmine may induce significant bradycardia. Caution is especially indicated in patients with sick sinus syndrome and pre-existing cardiac conduction abnormalities. Interactions with beta-blockers, calcium channel blockers, and digoxin may potentiate bradycardia and may predispose to significant hypotension.

Rizatriptan

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(rye za TRIP tan)

U.S. Brand NamesMaxalt-MLT®; Maxalt®

Canadian Brand NamesMaxalt RPD™; Maxalt™

Pharmacologic CategoryAntimigraine Agent; Serotonin 5-HT$_{1B, 1D}$ Receptor Agonist

Use: Labeled IndicationsAcute treatment of migraine with or without aura

Dosing: Adults **Note:** In patients with risk factors for coronary artery disease, following adequate evaluation to establish the absence of coronary artery disease, the initial dose should be administered in a setting where response may be evaluated (physician's office or similarly staffed setting). ECG monitoring may be considered.

Migraine: Oral: 5-10 mg, repeat after 2 hours if significant relief is not attained; maximum: 30 mg in a 24-hour period (use 5 mg dose in patients receiving propranolol with a maximum of 15 mg in 24 hours)

Note: For orally-disintegrating tablets (Maxalt-MLT®): Patient should be instructed to place tablet on tongue and allow to dissolve. Dissolved tablet will be swallowed with saliva.

Dosing: ElderlyRefer to adult dosing.

Dietary ConsiderationsOrally-disintegrating tablet contains phenylalanine (1.05 mg per 5 mg tablet, 2.10 mg per 10 mg tablet).

StorageStore in blister pack until administration.

ContraindicationsHypersensitivity to rizatriptan or any component of the formulation; documented ischemic heart disease or Prinzmetal's angina; uncontrolled hypertension; basilar or hemiplegic migraine; during or within 2 weeks of MAO inhibitors; during or within 24 hours of treatment with another 5-HT$_1$ agonist, or an ergot-containing or ergot-type medication (eg, methysergide, dihydroergotamine)

Allergy Considerations

- Serotonin 5-HT$_{1B,1D}$ Receptor Agonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiac events: Coronary artery vasospasm, transient ischemia, myocardial infarction, ventricular tachycardia/fibrillation, cardiac arrest, and death have been reported with 5-HT$_1$ agonist administration. Patients who experience sensations of chest pain/pressure/tightness or symptoms suggestive of angina following dosing should be evaluated for coronary artery disease or Prinzmetal's angina before receiving additional doses.
- Cerebrovascular events: Cerebral/subarachnoid hemorrhage and stroke have been reported with 5-HT$_1$ agonist administration.
- Elevated blood pressure: Significant elevation in blood pressure, including hypertensive crisis, has also been reported on rare occasions in patients with and without a history of hypertension.
- Vasospasm-related events: Peripheral vascular ischemia and colonic ischemia have been reported with 5-HT$_1$ agonist.

Disease-related concerns:

- Coronary artery disease: Should not be given to patients who have risk factors for CAD (eg, hypertension, hypercholesterolemia, smoker, obesity, diabetes, strong family history of CAD, menopause, male >40 years of age) without adequate cardiac evaluation. Patients with suspected CAD should have cardiovascular evaluation to rule out CAD before considering use; if cardiovascular evaluation "is satisfactory", first dose should be given in the healthcare provider's office. Periodic evaluation of cardiovascular status should be done in all patients.
- Hepatic impairment: Use with caution in patients with hepatic impairment; drug clearance may be reduced leading to increased plasma concentrations.
- Renal impairment: Use with caution in dialysis patients.

Concurrent drug therapy issues:

- Serotonin syndrome: Symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia may occur with concomitant proserotonergic drugs (ie, SSRIs/SNRIs or triptans) or agents which reduce rizatriptan's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <18 years of age.

Dosage form specific issues:

- Phenylalanine: Maxalt-MLT® tablets contain phenylalanine.

Other warnings/precautions:

- Appropriate use: Only indicated for treatment of acute migraine; if a patient does not respond to the first dose, the diagnosis of migraine should be reconsidered.

Geriatric ConsiderationsSince the elderly often have cardiovascular disease, careful evaluation of the use of 5-HT agonists is needed to avoid complications with the use of these agents. The pharmacokinetic disposition of these agents is similar to that seen in younger adults.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies using rizatriptan in pregnant women. Use only if potential benefit to the mother outweighs the potential risk to the fetus. A pregnancy registry has been established to monitor outcomes of women exposed to rizatriptan during pregnancy (800-986-8999). In some animal studies, administration was associated with decreased weight gain, developmental toxicity and increased mortality in the offspring. Teratogenic effects were not observed.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

1% to 10%:

Cardiovascular: Systolic/diastolic blood pressure increases (5-10 mm Hg), chest pain (5%), palpitation

Central nervous system: Dizziness, drowsiness, fatigue (13% to 30%, dose related)

Dermatologic: Skin flushing

Endocrine & metabolic: Mild increase in growth hormone, hot flashes

Gastrointestinal: Abdominal pain, dry mouth (<5%), nausea

Respiratory: Dyspnea

<1%: Akinesia, angina, arrhythmia, arthralgia, blurred vision, bradykinesia, decreased mental activity, diaphoresis, diarrhea, dry eyes, eye pain, facial edema, bradycardia, chills, hangover, heat sensitivity muscle weakness, myalgia, nasopharyngeal irritation, neck pain/stiffness, neurological/psychiatric abnormalities, pharyngitis, polyuria, pruritus, syncope, tachycardia, tinnitus

Postmarketing and/or case reports: Angioedema, dysgeusia, myocardial ischemia, MI, stroke, toxic epidermal necrolysis, wheezing

Drug Interactions

Ergot Derivatives: May enhance the vasoconstricting effect of Serotonin 5-HT1D Receptor Agonists. Serotonin 5-HT1D Receptor Agonists may enhance the vasoconstricting effect of Ergot Derivatives. *Risk X: Avoid combination*

MAO Inhibitors: May decrease the metabolism of Serotonin 5-HT1D Receptor Agonists. Management: If MAO inhibitor therapy is required, naratriptan, eletriptan or frovatriptan may be a suitable 5-HT1D agonist to employ. *Risk X: Avoid combination*

Propranolol: May increase the serum concentration of Serotonin 5-HT1D Receptor Agonists. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsFood: Food delays absorption.

Monitoring ParametersHeadache severity, signs/symptoms suggestive of angina; consider monitoring blood pressure, heart rate, and/or ECG with first dose in patients with likelihood of unrecognized coronary disease, such as patients with significant hypertension, hypercholesterolemia, obese patients, patients with diabetes, smokers with other risk factors or strong family history of coronary artery disease

Nursing: Physical Assessment/MonitoringFor use only with clear diagnosis of migraine. Evaluate presence of or at risk for coronary disease. Initial dose should be administered in a setting where response may be evaluated and ECG monitoring may be considered. Assess potential for interactions with other pharmacological agents patient may be taking (eg, ergot containing drugs, SSRIs). Assess effectiveness (relief of migraine) and adverse response (eg, drowsiness, nausea/vomiting, chest pain, palpitations). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsConsider monitoring vital signs and ECG with first dose in patients with unrecognized coronary disease, such as patients with significant hypertension, hypercholesterolemia, obese patients, patients with diabetes, smokers with other risk factors or strong family history of coronary artery disease

Patient EducationThis drug is to be used to reduce your migraine, not to prevent or reduce the number of attacks. Follow exact instructions for use. For orally-disintegrating tablets (Maxalt-MLT®), do not open blister pack before using. Open with dry hands, place on tongue, and allow to dissolve (dissolved tablet will be swallowed with saliva). Do not crush, break, or chew. Do not take within 24 hours of any other migraine medication without first consulting prescriber. If first dose brings relief, second dose may be taken anytime after 2 hours if migraine returns. Do not take more than two doses without consulting prescriber. May cause dizziness or drowsiness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); dry mouth (frequent mouth care and sucking on lozenges may help); skin flushing or hot flashes (cool clothes or a cool environment may help); or mild abdominal discomfort or nausea or vomiting. Report immediately any chest pain, palpitations, or irregular heartbeat; severe dizziness, acute headache, stiff or painful neck or facial swelling; muscle weakness or pain; changes in mental acuity; blurred vision or eye pain; or excessive perspiration or urination. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Maxalt®: 5 mg, 10 mg

Tablet, orally disintegrating:

Maxalt-MLT®: 5 mg [contains phenylalanine 1.05 mg/tablet; peppermint flavor]; 10 mg [contains phenylalanine 2.1 mg/tablet; peppermint flavor]

Generic AvailableNo
ManufacturerMerck & Co
Pricing: U.S. (www.drugstore.com)

Tablet, orally-disintegrating (Maxalt-MLT)

5 mg (3): $58.29

10 mg (6): $125.99

Tablets (Maxalt)

5 mg (6): $107.44

5 mg (12): $265.99

10 mg (12): $255.51

Mechanism of ActionSelective agonist for serotonin (5-HT$_{1D}$ receptor) in cranial arteries to cause vasoconstriction and reduce sterile inflammation associated with antidromic neuronal transmission correlating with relief of migraine
Pharmacodynamics/Kinetics

Onset of action: ~30 minutes

Duration: 14-16 hours

Protein binding: 14%

Metabolism: Via monoamine oxidase-A; first-pass effect

Bioavailability: 40% to 50%

Half-life elimination: 2-3 hours

Time to peak: 1-1.5 hours

Excretion: Urine (82%, 8% to 16% as unchanged drug); feces (12%)

Related Information

- Antimigraine Drugs: 5-HT1 Receptor Agonists

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDrowsiness and dizziness are common
Mental Health: Effects on Psychiatric TreatmentContraindicated with other serotonin agonists (SSRIs) and MAO inhibitors
Cardiovascular ConsiderationsCoronary vasospasm has been associated with 5-HT$_{1B/1D}$ agonists. These agents are contraindicated in patients with documented ischemic of vasospastic coronary artery disease. Patients with risk factors for CAD may receive these agents, provided a cardiovascular evaluation yields satisfactory evidence that the patient is free of cardiovascular disease. In patients with risk factors for CAD, administration of the initial dose in a medically staffed/equipped facility (ie, physician's office) is recommended. In addition, ECG monitoring after the initial dose should be considered. Patients who acquire risk factors for CAD, or long-term users of agents from this class of medications, should undergo periodic cardiovascular evaluation.
Anesthesia and Critical Care Concerns/Other ConsiderationsRizatriptan should not be used in patients with a history of vasospastic disease, Prinzmetal's angina, or any critical vascular disease.

Medication Safety Issues

Sound-alike/look-alike issues:

Zemuron® may be confused with Remeron®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(roe kyoor OH nee um)
U.S. Brand NamesZemuron®
Canadian Brand NamesZemuron®
Pharmacologic CategoryNeuromuscular Blocker Agent, Nondepolarizing
Use: Labeled IndicationsAdjunct to general anesthesia to facilitate both rapid sequence and routine endotracheal intubation and to relax skeletal muscles during surgery; to facilitate mechanical ventilation in ICU patients
Dosing: AdultsAdminister I.V.; dose to effect; doses will vary due to interpatient variability; use ideal body weight for obese patients

Tracheal intubation: I.V.:

Initial: 0.6 mg/kg is expected to provide approximately 31 minutes of clinical relaxation under opioid/nitrous oxide/oxygen anesthesia with neuromuscular block sufficient for intubation attained in 1-2 minutes; lower doses (0.45 mg/kg) may be used to provide 22 minutes of clinical relaxation with median time to neuromuscular block of 1-3 minutes; maximum blockade is achieved in <4 minutes

Maximum: 0.9-1.2 mg/kg may be given during surgery under opioid/nitrous oxide/oxygen anesthesia without adverse cardiovascular effects and is expected to provide 58-67 minutes of clinical relaxation; neuromuscular blockade sufficient for intubation is achieved in <2 minutes with maximum blockade in <3 minutes

Maintenance: 0.1, 0.15, and 0.2 mg/kg administered at 25% recovery of control T_1 (defined as 3 twitches of train-of-four) provides a median of 12, 17, and 24 minutes of clinical duration under anesthesia

Rapid sequence intubation: 0.6-1.2 mg/kg in appropriately premedicated and anesthetized patients with excellent or good intubating conditions within 2 minutes

Continuous infusion: Initial: 0.01-0.012 mg/kg/minute only after early evidence of spontaneous recovery of neuromuscular function is evident; infusion rates have ranged from 0.004-0.016 mg/kg/minute.

ICU neuromuscular blockade: 10 mcg/kg/minute; adjust dose to maintain appropriate degree of neuromuscular blockade (eg, 1 or 2 twitches on train-of-four)

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricAdminister I.V.; dose to effect; doses will vary due to interpatient variability; use ideal body weight for obese patients

Tracheal intubation: I.V.: Children ≥3 months:

Initial: 0.6 mg/kg under halothane anesthesia produce excellent to good intubating conditions within 1 minute and will provide a median time of 41 minutes of clinical relaxation in children 3 months to 1 year of age, and 27 minutes in children 1-12 years

Maintenance: 0.075-0.125 mg/kg administered upon return of T_1 to 25% of control provides clinical relaxation for 7-10 minutes

Administration: I.V.Administer I.V. only; may be given undiluted as a bolus injection or via a continuous infusion using an infusion pump
StorageStore under refrigeration (2°C to 8°C), do not freeze. When stored at room temperature, it is stable for 60 days; once opened, use within 30 days. Dilutions up to 5 mg/mL in 0.9% sodium chloride, dextrose 5% in water, 5% dextrose in sodium chloride 0.9%, or lactated Ringer's are stable for up to 24 hours at room temperature.
ContraindicationsHypersensitivity to rocuronium or any component of the formulation
Allergy Considerations

- Neuromuscular-Blocking Agent Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during use.

- Neuromuscular cross-sensitivity: Cross-sensitivity with other neuromuscular-blocking agents may occur; use extreme caution in patients with previous anaphylactic reactions.

Disease-related concerns:

- Burn injury: Resistance may occur in burn patients (>30% of body) for period of 5-70 days postinjury.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease; onset of action may be delayed and duration of action may be prolonged.
- Conditions which may *antagonize* neuromuscular blockade: Alkalosis, hypercalcemia, demyelinating lesions, peripheral neuropathies, denervation, infection, muscle trauma, and diabetes mellitus may result in antagonism of neuromuscular blockade.
- Conditions which may *potentiate* neuromuscular blockade: Electrolyte abnormalities, severe hyponatremia, severe hypocalcemia, severe hypokalemia, hypermagnesemia, neuromuscular diseases, acidosis, acute intermittent porphyria, Eaton-Lambert syndrome, myasthenia gravis, renal failure, and hepatic failure may result in potentiation of neuromuscular blockade.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.

Special populations:

- Elderly: Use with caution in the elderly, effects and duration are more variable.
- Immobilized patients: Resistance may occur in patients who are immobilized.
- Pediatrics: Safety and efficacy have not been established in children <3 months of age

Other warnings/precautions:

- Appropriate use: Maintenance of an adequate airway and respiratory support is critical. Rocuronium does not relieve pain or produce sedation; use should include appropriate anesthesia, pain control, and sedation.
- Experienced personnel: Should be administered by adequately trained individuals familiar with its use.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Rocuronium crosses the placenta; umbilical venous plasma levels are ~18% of the maternal concentration. The manufacturer does not recommend use for rapid sequence induction during cesarean section.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>1%: Cardiovascular: Transient hypotension (<1% to 2%) and hypertension (<1% to 2%)

<1%: Abnormal ECG, anaphylactoid reaction, anaphylaxis, arrhythmia, bronchospasm, edema, hiccups, injection site pruritus, nausea, rash, rhonchi, shock, tachycardia, vomiting, wheezing

Postmarketing and/or case reports: Acute quadriplegic myopathy syndrome (prolonged use), myositis ossificans (prolonged use)

Drug Interactions

Acetylcholinesterase Inhibitors: May diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Aminoglycosides: May enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Neuromuscular-Blocking Agents may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Neuromuscular-Blocking Agents may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Calcium Channel Blockers: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Cardiac Glycosides: Neuromuscular-Blocking Agents may enhance the arrhythmogenic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Colistimethate: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Neuromuscular-Blocking Agents (Nondepolarizing) may enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

Inhalational Anesthetics: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Neuromuscular-Blocking Agents (Nondepolarizing). Specifically, episodes of apnea have been reported in patients using this combination. *Risk C: Monitor therapy*

Lincosamide Antibiotics: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Lithium: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Loop Diuretics: May diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Loop Diuretics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Magnesium Salts: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Polymyxin B: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Procainamide: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

QuiNIDine: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Tetracycline Derivatives: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Vancomycin: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Monitoring ParametersPeripheral nerve stimulator measuring twitch response, heart rate, blood pressure, assisted ventilation status

Nursing: Physical Assessment/MonitoringOnly clinicians experienced in the use of neuromuscular blocking agents should administer and/or manage the use of rocuronium. Assess potential for interactions with other prescription or OTC medications or herbal products patient may be taking (eg, other drugs that affect neuromuscular activity may increase/decrease neuromuscular block induced by rocuronium). Dosage and rate of administration should be individualized and titrated to the desired effect, according to relevant clinical factors, premedication, concomitant medication, age, and general condition of the patient. Ventilatory support must be instituted and maintained until adequate respiratory muscle function and/or airway protection are assured. This drug does not cause anesthesia or analgesia; pain must be treated with appropriate agents. Continuous monitoring of vital signs, cardiac and respiratory status, and neuromuscular block (objective assessment with peripheral external nerve stimulator) are mandatory until full muscle tone has returned. Safety precautions must be maintained until full muscle tone has returned. Muscle tone returns in a predictable pattern; starting with diaphragm, abdomen, chest, limbs, and finally muscles of the neck, face, and eyes. **Note:** It may take longer for return of muscle tone in obese or elderly persons or patients with renal or hepatic disease, myasthenia gravis, myopathy, other neuromuscular diseases, dehydration, electrolyte imbalance, or severe acid/base imbalance. Provide appropriate teaching/support prior to, during, and following administration.

Long-term use: Monitor level of neuromuscular blockade, skeletal muscle movement, and respiratory effort. Every 2- to 3-hour repositioning, and skin, mouth, and eye care is necessary while patient is sedated. Emotional and sensory support (auditory and environmental) should be provided.

Patient EducationPatient education should be appropriate for patient condition. Reassurance of constant monitoring and emotional support should precede and follow administration. Patients should be reminded as muscle tone returns not to attempt to change position or rise from bed without assistance and to report and skin rash, hives, pounding heartbeat, respiratory difficulty, or muscle tremors. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as bromide: 10 mg/mL (5 mL, 10 mL)

Zemuron®: 10 mg/mL (5 mL, 10 mL)

Generic AvailableYes

Mechanism of ActionBlocks acetylcholine from binding to receptors on motor endplate inhibiting depolarization

Pharmacodynamics/Kinetics

Onset of action: Good intubation conditions in 1-2 minutes; maximum neuromuscular blockade within 4 minutes

Duration: ~30 minutes (with standard doses, increases with higher doses)

Distribution: V_d: ~0.25 L/kg

Protein binding: ~30%

Metabolism: Minimally hepatic; 17-desacetylrocuronium (5% to 10% activity of parent drug)

Half-life elimination: 60-70 minutes

Excretion: Feces (50%); urine (30%)

Related Information

- Neuromuscular-Blocking Agents

Pharmacotherapy PearlsRocuronium is classified as an intermediate-duration neuromuscular-blocking agent. Do not mix in the same syringe with barbiturates. Rocuronium does not relieve pain or produce sedation.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentPatients maintained on carbamazepine or phenytoin may have a decreased effect of rocuronium.

Mental Health CommentPatients with myasthenia gravis display an increased sensitivity to this neuromuscular-blocking agent.

Anesthesia and Critical Care Concerns/Other ConsiderationsClassified as an intermediate duration neuromuscular-blocking agent; do not mix in same syringe with barbiturates.

Critically-Ill Adult Patients:

The 2008 Surviving Sepsis Campaign guidelines recommend avoiding use of neuromuscular blockers if at all possible in the septic patient due to the risk of prolonged neuromuscular blockade following discontinuation. If one is required, monitor the depth of blockade (Grade 1B).

The 2002 ACCM/SCCM/ASHP clinical practice guidelines for sustained neuromuscular blockade in the adult critically-ill patient recommend:

Optimize sedatives and analgesics prior to initiation and monitor and adjust accordingly during course. Neuromuscular blockers do not relieve pain or produce sedation.

Protect patient's eyes from development of keratitis and corneal abrasion by administering ophthalmic ointment and taping eyelids closed or using eye patches. Reposition patient routinely to protect pressure points from breakdown. Address DVT prophylaxis.

Concurrent use of a neuromuscular blocker and corticosteroids appear to increase the risk of certain ICU myopathies; avoid or administer the corticosteroid at the lowest dose possible. Reassess need for neuromuscular blocker daily.

Using daily drug holidays (stopping neuromuscular-blocking agent until patient requires it again) may decrease the incidence of acute quadriplegic myopathy syndrome.

Tachyphylaxis can develop; switch to another neuromuscular blocker (taking into consideration the patient's organ function) if paralysis is still necessary.

Atracurium or cisatracurium is recommended for patients with significant hepatic or renal disease, due to organ-independent Hofmann elimination.

Monitor patients clinically and via “Train of Four” (TOF) testing with a goal of adjusting the degree of blockade to 1-2 twitches on based upon the patient's clinical condition.

Jump To Field (Select Field Name)

Pronunciation(roe mi PLOE stim)

U.S. Brand NamesNplate™

Pharmacologic Category[Colony Stimulating Factor]; [Thrombopoietic Agent]

Use: Labeled IndicationsTreatment of thrombocytopenia in patients with chronic immune (idiopathic) thrombocytopenia purpura (ITP) who have had insufficient response to corticosteroids, immune globulin, or splenectomy

Dosing: Adults**Note:** Initial dose is based on actual body weight. Discontinue if platelet count does not respond to a level that avoids clinically important bleeding after 4 weeks at the maximum recommended dose.

ITP: SubQ: Initial: 1 mcg/kg once weekly; adjust dose by 1 mcg/kg/week to achieve platelet count ≥50,000/mm^3 and to reduce the risk of bleeding; Maximum: 10 mcg/kg (median dose needed to achieve response in clinical trials: 2 mcg/kg)

Dosage adjustment recommendations:

Platelet count <50,000/mm^3: Increase dose by 1 mcg/kg

Platelet count >200,000/mm^3 for 2 consecutive weeks: Reduce dose by 1 mcg/kg

Platelet count >400,000/mm^3: Withhold dose; assess platelet count weekly; when platelet count <200,000/mm^3, resume with the dose reduced by 1 mcg/kg

Dosing: ElderlyRefer to adult dosing.

Administration: OtherAdminister SubQ. Administration volume may be small; use appropriate syringe (with graduations to 0.01 mL) for administration.

Dietary ConsiderationsNplate™ 250 mcg vial contains sucrose 15 mg and 500 mcg vial contains sucrose 25 mg.

StorageStore intact vials refrigerated at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light. Reconstituted solution may be stored at room temperature of 25°C (77°F) or refrigerated at 2°C to 8°C (36°F to 46°F) for up to 24 hours. Protect reconstituted solution from light.

ReconstitutionReconstitute with preservative free SWFI to a final concentration of 500 mcg/mL. Gently invert vial and swirl; do not shake.

RestrictionsApproved for use only under a risk management and restricted distribution program, Nplate™ NEXUS (Network of Experts Understanding and Supporting Nplate™ and Patients) program (1-877-675-2831 or www.nplate.com). Prescribers and patients must be registered with the program.

An FDA-approved medication guide is available; distribute to each patient to whom this medication is dispensed.

ContraindicationsThere are no contraindications listed within the manufacturer's labeling.

Warnings/Precautions

Concerns related to adverse effects:

- Bone marrow reticulin: May increase the risk for bone marrow reticulin formation or progression. Collagen fibrosis with cytopenias was not observed in clinical trials, although patients receiving romiplostim may be at risk for marrow fibrosis with cytopenias. Onset of new or worsening cellular abnormalities or cytopenias may warrant therapy discontinuation and subsequent bone marrow biopsy.

- Malignancy/tumorigenicity: Stimulation of cell surface thrombopoietin (TPO) receptors may increase the risk for hematologic malignancies. May increase the risk for progression of underlying myelodysplastic syndrome (MDS).

- Rebound thrombocytopenia: Upon discontinuation of therapy, thrombocytopenia may worsen. Severity may be greater than pretreatment level. Risk of bleeding is increased, particularly in patients receiving anticoagulants or antiplatelet agents; monitor closely. Rebound thrombocytopenia generally resolves within 14 days.

- Thromboembolism: Thromboembolism may occur with treatment. Use with caution in patients with a history of cerebrovascular disease.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; not studied in this population.

- Renal impairment: Use with caution in patients with renal impairment; not studied in this population.

Concurrent drug therapy issues:

- Concomitant ITP medications: May be used in combination with other therapies for ITP, including corticosteroids, danazol, azathioprine, immune globulin, or Rho(D) immune globulin. Reduce dose of or discontinue ITP medications when platelet count ≥50,000/mm^3.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Inadequate platelet response may be due to neutralizing antibodies (to romiplostim or TPO) or bone marrow fibrosis. Indicated only when the degree of thrombocytopenia and clinical conditions increase the risk for bleeding; use the lowest dose necessary to achieve and maintain platelet count platelet count ≥50,000/mm^3. Do not use to normalize platelet counts. Discontinue if platelet count does not respond to a level to avoid clinically important bleeding after 4 weeks at the maximum recommended dose.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAdverse effects were observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if the potential benefit to the mother outweighs the potential risk to the fetus. The Nplate™ pregnancy registry has been established to monitor outcomes of women exposed to romiplostim during pregnancy (1-877-675-2831).
LactationExcretion in breast milk unknown/ not recommended.
Adverse Reactions

>10%:

Central nervous system: Headache (35%), fatigue (33%), dizziness (17%), insomnia (16%)

Gastrointestinal: Diarrhea (17%), nausea (13%), abdominal pain (11%)

Neuromuscular & skeletal: Arthralgia (26%), myalgia (14%), back pain (13%), limb pain (13%)

Respiratory: Epistaxis (32%), upper respiratory tract infection (17%)

1% to 10%:

Gastrointestinal: Dyspepsia (7%)

Hematologic: Rebound thrombocytopenia (7%), bone marrow reticulin formation/deposition (4%)

Neuromuscular & skeletal: Shoulder pain (8%), paresthesia (6%)

Miscellaneous: Antibody formation (romiplostim 10%; TPO 5%)

<1%, postmarketing, and/or case reports: Thromboembolism

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersCBC with differential and platelets (baseline, during treatment [weekly until platelet response stable for 4 weeks then monthly] and weekly for at least 2 weeks following completion of treatment)

Evaluate for neutralizing antibodies in patients with inadequate response (blood samples may be submitted to Amgen for assay [1-800-772-6436]).

Reference RangeTarget platelet count of 50,000-200,000/mm^3; platelet life span: 8-11 days
Nursing: Physical Assessment/MonitoringPatient and provider must be registered with the Network of Experts Understanding and Supporting Nplate and Patients program (NEXUS™). Evaluate history of cerebrovascular disease prior to beginning treatment. Evaluate results of laboratory tests prior to, on a regular scheduled basis during therapy, and following discontinuation of therapy (rebound thrombocytopenia may be severe). Assess adverse response on a frequent basis during therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.
Monitoring: Lab TestsCBC with differential and platelets (baseline, during treatment [weekly until platelet response stable for 4 weeks then monthly] and weekly for at least 2 weeks following completion of treatment)

Evaluate for neutralizing antibodies in patients with inadequate response (blood samples may be submitted to Amgen for assay [1-800-772-6436]).

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy unless approved by prescriber. This medication can only be administered by injection. You will require frequent blood tests to determine appropriate dosage and to reduce potential for severe adverse effects; maintaining laboratory testing schedule is vital. May cause nausea, vomiting, or loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); dizziness, lightheadedness, fatigue, or insomnia (use caution when driving or engaging in tasks that require alertness until response to drug is known); or muscle, joint, back, or limb pain (consult prescriber for appropriate analgesic; do not self-medicate for pain). Report difficulty breathing, signs of a respiratory infection, or other unusual or persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Nplate™: 250 mcg [contains sucrose 15 mg/vial]; 500 mcg [contains sucrose 25 mg/vial]

Generic AvailableNo
ManufacturerAmgen, Inc
Mechanism of ActionThrombopoietin (TPO) peptide mimetic which increases platelet counts in ITP by binding to and activating the human TPO receptor.
Pharmacodynamics/Kinetics

Onset of action: Platelet count increase: SubQ: 4-9 days; Peak platelet count increase: Days 12-16

Duration: Platelet counts return to baseline by day 28

Absorption: SubQ: Slow

Half-life elimination: Median: 3.5 days (range: 1-34 days)

Time to peak, plasma: SubQ: Median: 14 hours (range: 7-50 hours)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDizziness, fatigue, and insomnia are common
Mental Health: Effects on Psychiatric TreatmentGI side effects are common; combined use with SSRIs, lithium, valproic acid, and carbamazepine may produce additive effects

Medication Safety Issues

Sound-alike/look-alike issues:

Requip® may be confused with Reglan®

Ropinirole may be confused with ropivacaine

Pronunciation(roe PIN i role)

U.S. Brand NamesRequip®; Requip® XL™

Canadian Brand NamesRequip®

Pharmacologic CategoryAnti-Parkinson's Agent, Dopamine Agonist

Use: Labeled IndicationsTreatment of idiopathic Parkinson's disease; in patients with early Parkinson's disease who were not receiving concomitant levodopa therapy as well as in patients with advanced disease on concomitant levodopa; treatment of moderate-to-severe primary Restless Legs Syndrome (RLS)

Dosing: Adults

Parkinson's disease: Oral:

Immediate release tablet: The dosage should be increased to achieve a maximum therapeutic effect, balanced against the principal side effects of nausea, dizziness, somnolence and dyskinesia. Recommended starting dose is 0.25 mg 3 times/day; based on individual patient response, the dosage should be titrated with weekly increments as described below:

- Week 1: 0.25 mg 3 times/day; total daily dose: 0.75 mg
- Week 2: 0.5 mg 3 times/day; total daily dose: 1.5 mg
- Week 3: 0.75 mg 3 times/day; total daily dose: 2.25 mg
- Week 4: 1 mg 3 times/day; total daily dose: 3 mg

Note: After week 4, if necessary, daily dosage may be increased by 1.5 mg/day on a weekly basis up to a dose of 9 mg/day, and then by up to 3 mg/day weekly to a total of 24 mg/day

Parkinson's disease discontinuation taper: Ropinirole should be gradually tapered over 7 days as follows: reduce frequency of administration from 3 times daily to twice daily for 4 days, then reduce to once daily for remaining 3 days.

Extended release tablet: Initial: 2 mg once daily for 1-2 weeks, followed by increases of 2 mg/day at weekly or longer intervals based on therapeutic response and tolerability (maximum: 24 mg/day); **Note:** When discontinuing gradually taper over 7 days.

Restless legs syndrome: Oral: Immediate release tablets: Initial: 0.25 mg once daily 1-3 hours before bedtime. Dose may be increased after 2 days to 0.5 mg daily, and after 7 days to 1 mg daily. Dose may be further titrated upward in 0.5 mg increments every week until reaching a daily dose of 3 mg during week 6. If symptoms persist or reappear, the daily dose may be increased to a maximum of 4 mg beginning week 7.

Note: Doses up to 4 mg per day may be discontinued without tapering.

Converting from ropinirole immediate release tablets to ropinirole extended-release tablets: Choose a once daily extended-release dose that most closely matches current immediate-release daily dose.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

No adjustment needed in patients with moderate renal impairment (Cl_{cr} 30-50 mL/minute); has not been studied in patients with severe impairment.

Removal by hemodialysis is unlikely.

Dosing: Hepatic ImpairmentTitrate with caution; has not been studied.

Administration: OralMay be administered with or without food; taking with food may reduce nausea. Swallow extended-release tablet whole; do not crush, split, or chew.

Dietary ConsiderationsMay be taken with or without food; taking with food may reduce nausea.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light.

ContraindicationsHypersensitivity to ropinirole or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Hallucinations: May cause hallucinations; risk may be increased in the elderly.

- Impulsive control disorders: Dopamine agonists used for Parkinson’s disease or restless legs syndrome have been associated with compulsive behaviors and/or loss of impulse control, which has manifested as pathological gambling, libido increases (hypersexuality), and/or binge eating. Causality has not been established, and controversy exists as to whether this phenomenon is related to the underlying disease, prior behaviors/addictions and/or drug therapy. Dose reduction or discontinuation of therapy has been reported to reverse these behaviors in some, but not all cases.

- Melanoma: Risk of melanoma has been reported in patients receiving ropinirole; drug causation has not been established.

- Orthostatic hypotension: May cause orthostatic hypotension; Parkinson's disease patients appear to have an impaired capacity to respond to a postural challenge. Use with caution in patients at risk of hypotension (such as those receiving antihypertensive drugs) or where transient hypotensive episodes would be poorly tolerated (cardiovascular disease or cerebrovascular disease). Parkinson's patients being treated with dopaminergic agonists ordinarily require careful monitoring for signs and symptoms of postural hypotension, especially during dose escalation, and should be informed of this risk. Syncope, sometimes associated with bradycardia, was observed in association with ropinirole in both early Parkinson's disease (without levodopa) patients and advanced Parkinson's disease (with levodopa) patients.

- Pleural/retroperitoneal fibrosis: Risk of fibrotic complications (eg, pleural effusion/fibrosis, interstitial lung disease) has been reported in patients receiving ropinirole; drug causation has not been established.

- Retinal changes: Pathologic degenerative changes were observed in the retinas of albino rats during studies with this agent, but were not observed in the retinas of albino mice or in other species. The significance of these data for humans remains uncertain.

- Somnolence: Patients have reported falling asleep while engaging in activities of daily living; this has been reported to occur without significant warning signs. Monitor for daytime somnolence or pre-existing sleep disorder; caution with concomitant sedating medication; discontinue if significant daytime sleepiness or episodes of falling asleep occur. Patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). Use with caution in patients receiving other CNS depressants or psychoactive agents. Effects with other sedative drugs or ethanol may be potentiated.

Disease-related concerns:

- Dyskinesias: Use with caution in patients with pre-existing dyskinesias; may be exacerbated.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

- Psychotic disorders: Avoid use in patients with a major psychotic disorder; may exacerbate psychosis.

- Renal impairment: Use with caution in patients with severe renal impairment.

- Restless legs syndrome (RLS): Augmentation (earlier onset of symptoms in the evening/afternoon, increase and/or spread of symptoms to other extremities) or rebound (shifting of symptoms to early morning hours) may occur in some RLS patients.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Discontinuation of therapy: Dopaminergic agents have been associated with a syndrome resembling neuroleptic malignant syndrome on abrupt withdrawal or significant dosage reduction after long-term use.

Geriatric ConsiderationsSince the dose is titrated to clinical response, no specific dosage adjustment is necessary in the elderly.
Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects have been observed in animal studies. There are no adequate and well-controlled studies in pregnant women; use only if potential benefit outweighs the risk to the fetus.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsRopinirole inhibits prolactin secretion in humans and may potentially inhibit lactation. Ropinirole has been detected in the milk of lactating rats, however, transfer of ropinirole in human milk has not been demonstrated. Due to the potential for serious adverse reactions, a decision should be made whether to discontinue nursing or discontinue the drug, taking into account the importance of the drug to the mother.
Adverse Reactions

Data inclusive of trials in early Parkinson's disease (without levodopa) and Restless Legs Syndrome:

>10%:

Cardiovascular: Syncope (1% to 12%)

Central nervous system: Somnolence (11% to 40%), dizziness (6% to 40%), fatigue (8% to 11%)

Gastrointestinal: Nausea (immediate release: 40% to 60%; extended release: 19%), vomiting (11% to 12%)

Miscellaneous: Viral infection (11%)

1% to 10%:

Cardiovascular: Dependent/leg edema (2% to 7%), orthostasis (1% to 6%), hypertension (5%), chest pain (4%), flushing (3%), palpitation (3%), peripheral ischemia (2% to 3%), atrial fibrillation (2%), extrasystoles (2%), hypotension (2%), tachycardia (2%)

Central nervous system: Pain (3% to 8%), headache (extended release: 6%), confusion (5%), hallucinations (up to 5%; dose related), hypoesthesia (4%), amnesia (3%), malaise (3%), yawning (3%), concentration impaired (2%), vertigo (2%)

Dermatologic: Hyperhidrosis (3%)

Gastrointestinal: Constipation (≥5%), dyspepsia (4% to 10%), abdominal pain (3% to 7%), xerostomia (3% to 5%), diarrhea (5%), anorexia (4%), flatulence (3%)

Genitourinary: Urinary tract infection (5%), impotence (3%)

Hepatic: Alkaline phosphatase increased (3%)

Neuromuscular & skeletal: Weakness (6%), arthralgia (4%), muscle cramps (3%), paresthesia (3%), hyperkinesia (2%)

Ocular: Abnormal vision (6%), xerophthalmia (2%)

Respiratory: Pharyngitis (6% to 9%), rhinitis (4%), sinusitis (4%), bronchitis (3%), dyspnea (3%), influenza (3%), cough (3%), nasal congestion (2%)

Miscellaneous: Diaphoresis increased (3% to 6%)

Advanced Parkinson's disease (with levodopa):

>10%:

Central nervous system: Dizziness (immediate release: 26%; extended-release: 8%), somnolence (immediate release: 20%, extended release: 7%), headache (17%)

Gastrointestinal: Nausea (immediate release: 30%; extended-release: 11%)

Neuromuscular & skeletal: Dyskinesias (immediate release: 34%; extended-release: 13%; dose related)

1% to 10%:

Cardiovascular: Hypotension (2% to 5%; including orthostatic), peripheral edema (4%), syncope (3%), hypertension (3%; dose related)

Central nervous system: Hallucinations (7% to 10%; dose related), confusion (9%), anxiety (2% to 6%), amnesia (5%), nervousness (5%), pain (5%), vertigo (4%), abnormal dreaming (3%), paresis (3%), aggravated parkinsonism, insomnia

Gastrointestinal: Abdominal pain (6% to 9%), vomiting (7%), constipation (4% to 6%), diarrhea (3% to 5%), xerostomia (2% to 5%), dysphagia (2%), flatulence (2%), salivation increased (2%), weight loss (2%)

Genitourinary: Urinary tract infection (6%), pyuria (2%), urinary incontinence (2%)

Hematologic: Anemia (2%)

Neuromuscular & skeletal: Falls (2% to 10%; dose related), arthralgia (7%), tremor (6%), hypokinesia (5%), paresthesia (5%), arthritis (3%), back pain (3%)

Ocular: Diplopia (2%)

Respiratory: Upper respiratory tract infection (9%), dyspnea (3%)

Miscellaneous: Injury, diaphoresis increased (7%), viral infection, increased drug level (7%)

Other adverse effects (all phase 2/3 trials for Parkinson's disease and Restless Leg Syndrome):

≥1%: Asthma, BUN increased, depression, gastroenteritis, gastrointestinal reflux, irritability, migraine, muscle spasm, myalgia, neck pain, neuralgia, osteoarthritis, pharyngolaryngeal pain, rash, rigors, sleep disorder, tendonitis

<1% (Limited to important or life-threatening): Abnormal coordination, acidosis, agitation, aneurysm, angina, aphasia, behavioral disorders, bradycardia, bundle branch block, cardiac arrest, cardiac failure, cardiomegaly, cellulitis, cholecystitis, cholelithiasis, choreoathetosis, colitis, coma, conjunctival hemorrhage, dehydration, diabetes mellitus, diverticulitis, Dupuytren's contracture, dysphonia, electrolyte disturbances, eosinophilia, extrapyramidal symptoms, gangrene, gastrointestinal hemorrhage, gastrointestinal ulceration, glaucoma, goiter, gynecomastia, hematuria, hemiparesis, hemiplegia, hepatitis (ischemic), hyperbilirubinemia, hypercholesterolemia, hyper-/hypothyroidism, hyper-/hypotonia, hypoglycemia, hyponatremia, hyperphosphatemia, hyperuricemia; infections (bacterial, viral or fungal); intestinal obstruction, leukocytosis, leukopenia, limb embolism, liver enzymes increased, lymphadenopathy, lymphedema, lymphocytosis, lymphopenia, menstrual abnormalities, mitral insufficiency, MI, neoplasms (various), pancreatitis, paralysis, peripheral neuropathy, photosensitivity, pleural effusion, proteinuria, psychiatric disorders, pulmonary edema, pulmonary embolism, renal calculus, renal failure (acute), seizure, sepsis, SIADH, skin disorders, stomatitis, stupor, subarachnoid hemorrhage, suicide attempt, SVT, thrombocytopenia, thrombosis, tinnitus, tongue edema, torticollis, urticaria, vagina/uterine hemorrhage, ventricular tachycardia, visual disturbances

Postmarketing and/or case reports: Cardiac valvulopathy; impulsive/compulsive behaviors (eg, pathological gambling, hypersexuality, binge eating); interstitial lung disease, pleural fibrosis

Metabolism/Transport Effects **Substrate** of CYP1A2 (major), 3A4 (minor); **Inhibits** CYP1A2 (weak)
Drug Interactions

Antipsychotics (Atypical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Antipsychotics (Typical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Ciprofloxacin: May decrease the metabolism of Ropinirole. *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Metoclopramide: May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid kava kava, gotu kola, valerian, St John's wort (may increase CNS depression).

Monitoring Parameters

Blood pressure (orthostatic); daytime alertness

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Monitor blood pressure periodically. Assess therapeutic effectiveness and adverse responses on a regular basis during therapy. Monitor for CNS depression/somnolence. Teach patient proper use, side effects/appropriate interventions, and adverse reactions to report.

Patient EducationTake exactly as directed, without regard to food. Avoid alcohol use and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. May cause dizziness; sudden, overwhelming sleepiness (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution and avoid quick moves when rising from sitting or lying position, when climbing stairs, or engaging in activities that require quick movements); loss of impulse control (possibly manifested as pathological gambling, libido increases, and/or binge eating); or nausea, vomiting, lack of appetite, or mouth sores (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report unusual and persistent sleepiness; chest pain or palpitations; CNS changes (confusion, hallucinations, amnesia, abnormal dreaming, insomnia); suicide ideation; skeletal weakness or increased random tremors or movements, gait changes, or difficulty walking; signs of urinary tract or respiratory infection (pain or burning on urination, pus or blood in urine, or unusual cough and chest tightness); or unusual persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Combination package:

Requip® [starter kit; contents per each administration card]: Tablet: 0.25 mg (2s), 0.5 mg (5s), 1 mg (7s) [DSC]

Tablet: 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg, 5 mg

Requip®: 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg, 5 mg

Tablet, extended-release:

Requip® XL™: 2 mg, 4 mg, 8 mg

Generic AvailableYes: Excludes combination package, extended-release tablets

ManufacturerSmithKline Beecham Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

5 mg (100): $65.98

Mechanism of ActionRopinirole has a high relative *in vitro* specificity and full intrinsic activity at the D_2 and D_3 dopamine receptor subtypes, binding with higher affinity to D_3 than to D_2 or D_4 receptor subtypes; relevance of D_3 receptor binding in Parkinson's disease is unknown. Ropinirole has moderate *in vitro* affinity for opioid receptors. Ropinirole and its metabolites have negligible *in vitro* affinity for dopamine D_1, 5-HT_1, 5-HT_2, benzodiazepine, GABA, muscarinic, alpha$_1$-, alpha$_2$-, and beta-adrenoreceptors. Although precise mechanism of action of ropinirole is unknown, it is believed to be due to stimulation of postsynaptic dopamine D_2-type receptors within the caudate putamen in the brain. Ropinirole caused decreases in systolic and diastolic blood pressure at doses >0.25 mg. The mechanism of ropinirole-induced postural hypotension is believed to be due to D_2-mediated blunting of the noradrenergic response to standing and subsequent decrease in peripheral vascular resistance.

Pharmacodynamics/Kinetics

Absorption: Not affected by food

Distribution: V_d: 525 L

Protein binding: 40%

Metabolism: Extensively hepatic via CYP1A2 to inactive metabolites; first-pass effect

Bioavailability: Absolute: 45% to 55%

Half-life elimination: ~6 hours

Time to peak: Immediate release: ~1-2 hours; Extended release: 6-10 hours; T_{max} increased by 2.5-3 hours when drug taken with food

Excretion: Urine (<10% as unchanged drug, 60% as metabolites)

Clearance: Reduced by 15% to 30% in patients >65 years of age

Related Information

- Antiparkinsonian Agents

Pharmacotherapy PearlsIf therapy with a drug known to be a potent inhibitor of CYP1A2 is stopped or started during treatment with ropinirole, adjustment of ropinirole dose may be required. Ropinirole binds to melanin-containing tissues (ie, eyes, skin) in pigmented rats. After a single dose, long-term retention of drug was demonstrated, with a half-life in the eye of 20 days; not known if ropinirole accumulates in these tissues over time.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and increased salivation (normal salivary flow resumes upon discontinuation) and dysphagia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Anesthesia and Critical Care Concerns/Other ConsiderationsIf therapy with a drug known to be a potent inhibitor of CYP1A2 is stopped or started during treatment with ropinirole, adjustment of ropinirole dose may be required.

Index TermsRopinirole Hydrochloride

Ropivacaine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Ropivacaine may be confused with bupivacaine, ropinirole

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (epidural administration) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(roe PIV a kane)

U.S. Brand NamesNaropin®

Canadian Brand NamesNaropin®

Pharmacologic CategoryLocal Anesthetic

Use: Labeled IndicationsLocal anesthetic for use in surgery, postoperative pain management, and obstetrical procedures when local or regional anesthesia is needed

Dosing: AdultsDose varies with procedure, onset and depth of anesthesia desired, vascularity of tissues, duration of anesthesia, and condition of patient

Surgical anesthesia:

Lumbar epidural: 15-30 mL of 0.5% to 1% solution

Lumbar epidural block for cesarean section:

20-30 mL dose of 0.5% solution

15-20 mL dose of 0.75% solution

Thoracic epidural block: 5-15 mL dose of 0.5% to 0.75% solution

Major nerve block:

35-50 mL dose of 0.5% solution (175-250 mg)

10-40 mL dose of 0.75% solution (75-300 mg)

Field block: 1-40 mL dose of 0.5% solution (5-200 mg)

Labor pain management: Lumbar epidural: Initial: 10-20 mL 0.2% solution; continuous infusion dose: 6-14 mL/hour of 0.2% solution with incremental injections of 10-15 mL/hour of 0.2% solution

Postoperative pain management:

Lumbar or thoracic epidural: Continuous infusion dose: 6-14 mL/hour of 0.2% solution

Infiltration/minor nerve block:

1-100 mL dose of 0.2% solution

1-40 mL dose of 0.5% solution

Dosing: ElderlyRefer to adult dosing.

Administration: OtherAdministered via local infiltration, epidural block and epidural infusion, or intermittent bolus

StorageStore at 20°C to 25°C (68°F to 77°F). Infusions should be discarded after 24 hours.

ContraindicationsHypersensitivity to ropivacaine, amide-type local anesthetics (eg, bupivacaine, mepivacaine, lidocaine), or any component of the formulation

Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS toxicity: Careful and constant monitoring of the patient's state of consciousness should be done following each local anesthetic injection; at such times, restlessness, anxiety, tinnitus, dizziness, blurred vision, tremors, depression, or drowsiness may be early warning signs of CNS toxicity. Treatment is primarily symptomatic and supportive.

- Respiratory arrest: Local anesthetics have been associated with rare occurrences of sudden respiratory arrest.

- Seizures: Convulsions due to systemic toxicity leading to cardiac arrest have also been reported, presumably following unintentional intravascular injection.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with hypotension, hypovolemia, heart block, or cardiovascular disease; may be at greater risk for toxicity.

- Hepatic impairment: Use with caution in patients with hepatic impairment; may be at greater risk for toxicity.

- Neurological disorders: Use with caution in patients with neurological disorders; may be at greater risk for toxicity.

- Psychiatric disorders: Use with caution in patients with psychiatric disorders; may be at greater risk for toxicity.

Concurrent drug therapy issues:

- Type III antiarrhythmics: Use with caution in patients on type III antiarrhythmics (eg, amiodarone); consider ECG monitoring since cardiac effects may be additive.

Special populations:

- Acutely ill patients: Use with caution in acutely ill; may be at greater risk for toxicity.

- Debilitated patients: Use with caution in debilitated patient; may be at greater risk for toxicity.

- Elderly: Use with caution in the elderly: may be at greater risk for toxicity. Cardiovascular adverse events (bradycardia, hypotension) may be age-related (more common in patients >61 years of age).

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Administration: Intravascular injections should be avoided; aspiration should be performed prior to administration; the needle must be repositioned until no return of blood can be elicited by aspiration; however, absence of blood in the syringe does not guarantee that intravascular injection has been avoided.

- Rapid administration: Ropivacaine is not recommended for use in emergency situations where rapid administration is necessary.

- Trained personnel: Clinicians using local anesthetic agents should be well trained in diagnosis and management of emergencies that may arise from the use of these agents. Resuscitative equipment, oxygen, and other resuscitative drugs should be available for immediate use.

⇧ Pregnancy Risk FactorB

⇧ Pregnancy ConsiderationsTeratogenic events were not observed in animal studies. When used for epidural block during labor and delivery, systemically absorbed ropivacaine may cross the placenta, resulting in varying degrees of fetal or neonatal effects (eg, CNS or cardiovascular depression). Fetal or neonatal adverse events include fetal bradycardia (12%), neonatal jaundice (8%), low Apgar scores (3%), fetal distress (2%), neonatal respiratory disorder (3%). Maternal hypotension may also result from systemic absorption. In cases of hypotension, position pregnant woman in left lateral decubitus position to prevent aortocaval compression by the gravid uterus. Epidural anesthesia may prolong the second stage of labor.

⇧ LactationExcretion in breast milk unknown/use caution

⇧ Adverse Reactions

>10%:

Cardiovascular: Hypotension (dose-related and age-related: 32% to 69%), bradycardia (6% to 20%)

Gastrointestinal: Nausea (11% to 29%), vomiting (7% to 14%)

Neuromuscular & skeletal: Back pain (7% to 16%)

1% to 10%:

Cardiovascular: Hypertension, tachycardia, chest pain (1% to 5%)

Central nervous system: Fever (3% to 9%), headache (5% to 8%), dizziness (3%), chills (2% to 3%), anxiety (1%), lightheadedness

Dermatologic: Pruritus (1% to 5%)

Endocrine & metabolic: Hypokalemia

Genitourinary: Urinary retention (1% to 5%), urinary tract infection (1% to 5%)

Hematologic: Anemia (6%)

Neuromuscular & skeletal: Paresthesia (2% to 6%), hypoesthesia, rigors, circumoral paresthesia

Renal: Oliguria

Respiratory: Dyspnea

Miscellaneous: Shivering

<1% (Limited to important or life-threatening): Accidental I.V. injection (0.2%), angioedema, allergic reaction, apnea (usually associated with epidural block in head/neck region), bronchospasm, cardiac arrest, cardiovascular collapse, dyskinesia, hallucination, hyperthermia, laryngeal edema, myocardial depression, MI, rash, seizure, syncope, tinnitus, urticaria, ventricular arrhythmia

Metabolism/Transport Effects**Substrate** of CYP1A2 (major), 2B6 (minor), 2D6 (minor), 3A4 (minor; may be major in cases of 1A2 inhibition/deficiency)

Drug Interactions

Ciprofloxacin: May decrease the metabolism of Ropivacaine. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

Fluvoxamine: May decrease the metabolism of Ropivacaine. *Risk C: Monitor therapy*

Fospropofol: May increase the serum concentration of Ropivacaine. Specifically, propofol (the active metabolite of fospropofol) is the entity with the potential to interact with ropivacaine. *Risk C: Monitor therapy*

Propofol: May increase the serum concentration of Ropivacaine. *Risk C: Monitor therapy*

Monitoring ParametersHeart rate, blood pressure, ECG monitoring (if used with antiarrhythmics)

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion, as hydrochloride:

Naropin®: 2 mg/mL (100 mL, 200 mL)

Injection, solution, as hydrochloride [preservative free]:

Naropin®: 2 mg/mL (10 mL, 20 mL); 5 mg/mL (20 mL, 30 mL); 7.5 mg/mL (20 mL); 10 mg/mL (10 mL, 20 mL)

Generic AvailableNo

ManufacturerAstraZeneca Pharmaceuticals LP

Mechanism of ActionBlocks both the initiation and conduction of nerve impulses by decreasing the neuronal membrane's permeability to sodium ions, which results in inhibition of depolarization with resultant blockade of conduction

Pharmacodynamics/Kinetics

Onset of action: Anesthesia (route dependent): 3-15 minutes

Duration (dose and route dependent): 3-15 hours

Metabolism: Hepatic, via CYP1A2 to metabolites

Half-life elimination: Epidural: 5-7 hours

Excretion: Urine (86% as metabolites)

Dental Health Professional ConsiderationsNot available with vasoconstrictor (epinephrine) and not available in dental (1.8 mL) carpules

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions (see Dental Comment)

Mental Health: Effects on Mental StatusMay cause anxiety or dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Mental Health CommentConcomitant use with fluvoxamine may produce increased effects of ropivacaine

Anesthesia and Critical Care Concerns/Other ConsiderationsOnly preservative-free solutions should be used for epidural and spinal administration. Although ropivacaine is chemically related to bupivacaine, it is not a racemic mixture (made up of the S-form enantiomer only) and, is less toxic than bupivacaine.

Local anesthetic toxicity: Cardiac arrest: Lipid infusion has been used in animal studies and several human cases (Bupivacaine: Rosenblatt, 2006; Levobupivacaine: Foxall, 2007; Ropivacaine: Litz, 2006) where cardiovascular toxicity, unresponsive to conventional resuscitation, resulted. Additional information is available at http://www.lipidrescue.org. The protocol from the website is: **20% Fat Emulsion:** 1.5 mL/kg administered over 1 minute, followed immediately by an infusion of 0.25 mL/kg/minute. Continue chest compressions (lipid must circulate). Repeat bolus every 3-5 minutes up to 3 mL/kg total dose until circulation restored. Continue infusion until hemodynamic stability is restored. Increase the infusion rate to 0.5 mL/kg/minute if BP declines. A maximum total dose of 8 mL/kg is recommended.

Index TermsRopivacaine Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(roh si GLI ta zone & GLYE me pye ride)

U.S. Brand NamesAvandaryl®

Pharmacologic CategoryAntidiabetic Agent, Sulfonylurea; Antidiabetic Agent, Thiazolidinedione

Use: Labeled IndicationsManagement of type 2 diabetes mellitus (noninsulin dependent, NIDDM) as an adjunct to diet and exercise

Dosing: Adults**Type 2 diabetes mellitus:** Oral: Initial: Rosiglitazone 4 mg and glimepiride 1 mg once daily **or** rosiglitazone 4 mg and glimepiride 2 mg once daily (for patients previously treated with sulfonylurea or thiazolidinedione monotherapy)

Patients switching from combination rosiglitazone and glimepiride as separate tablets: Use current dose.

Titration:

Dose adjustment in patients previously on sulfonylurea monotherapy: May take 2 weeks to observe decreased blood glucose and 2-3 months to see full effects of rosiglitazone component. If not adequately controlled after 8-12 weeks, increase daily dose of rosiglitazone component.

Dose adjustment in patients previously on thiazolidinedione monotherapy: If not adequately controlled after 1-2 weeks, increase daily dose of glimepiride component in ≤2 mg increments in 1-2 week intervals.

Maximum dose:

U.S. labeling: Rosiglitazone 8 mg and glimepiride 4 mg once daily

Canadian labeling: Rosiglitazone 4 mg and glimepiride 4 mg once daily

Dosing: Elderly Rosiglitazone 4 mg and glimepiride 1 mg once daily. Carefully titrate dose.

Dosing: Renal ImpairmentRosiglitazone 4 mg and glimepiride 1 mg once daily. Carefully titrate dose.

Dosing: Hepatic ImpairmentRosiglitazone 4 mg and glimepiride 1 mg once daily. Carefully titrate dose.

ALT ≤2.5 times ULN: Use with caution.

ALT >2.5 times ULN: Do not initiate therapy.

ALT >3 times ULN or jaundice: Discontinue.

Administration: OralShould be administered with the first meal of the day.

Dietary ConsiderationsAdminister with the first main meal of the day. Dietary modification based on ADA recommendations is a part of therapy. Decreases blood glucose concentration. Hypoglycemia may occur. Must be able to recognize symptoms of hypoglycemia (palpitations, sweaty palms, lightheadedness).

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsNYHA Class III/IV heart failure (initiation of therapy)

Canadian labeling: Additional contraindications (not in U.S. labeling): Hypersensitivity to rosiglitazone, glimepiride, other sulfonamides, or any component of the formulation; any stage of heart failure (eg, NYHA Class I, II, III, IV); serious hepatic impairment; diabetic ketoacidosis (with or without coma); pregnancy

Warnings/Precautions

Boxed warnings:

- Heart failure/cardiac effects: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Cardiovascular mortality: Product labeling states oral hypoglycemic drugs may be associated with an increased cardiovascular mortality as compared to treatment with diet alone or diet plus insulin. Data to support this association are limited, and several studies, including a large prospective trial (UKPDS) have not supported an association.

- Fractures: Increased incidence of bone fractures in females treated with rosiglitazone observed during analysis of long-term trial;

majority of fractures occurred in the upper arm, hand and foot (differing from the hip or spine fractures usually associated with postmenopausal osteoporosis). Consider risk of fracture prior to initiation and during use.

- Heart failure/cardiac effects: **[U.S. Boxed Warning]: Thiazolidinediones, including rosiglitazone, may cause or exacerbate congestive heart failure;** closely monitor for signs and symptoms of congestive heart failure (eg, rapid weight gain, dyspnea, edema), particularly after initiation or dose increases. Not recommended for use in any patient with symptomatic heart failure. In the U.S., initiation of therapy is contraindicated in patients with NYHA class III or IV heart failure; in Canada, use is contraindicated in patients with any stage of heart failure (NYHA I, II, III, IV). Use with caution in patients with edema; may increase plasma volume and/or cause fluid retention. A higher frequency of cardiovascular events has been noted in patients with NYHA class I or II heart failure treated with rosiglitazone. Use may also be associated with an increased risk of angina and MI. Use with caution in patients at risk for cardiovascular events and monitor closely. Discontinue if any deterioration in cardiac status occurs.

- Hematologic effects: Rosiglitazone may decrease hemoglobin, hematocrit, and/or WBC count (slight); effects may be related to increased plasma volume and/or dose-related. Use with caution in patients with anemia; may reduce hemoglobin and hematocrit.

- Hypoglycemia: All sulfonylurea drugs are capable of producing severe hypoglycemia. Hypoglycemia is more likely to occur when caloric intake is deficient, after severe or prolonged exercise, when ethanol is ingested, or when more than one glucose-lowering drug is used. It is also more likely in elderly patients, malnourished patients and in patients with impaired renal or hepatic function; use with caution.

- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). A risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Use in patients with sulfonamide allergy is specifically contraindicated in Canadian labeling.

- Weight gain: Dose-related weight gain observed with rosiglitazone use; mechanism unknown but likely associated with fluid retention and fat accumulation.

Disease-related concerns:

- Diabetes, type 1: Mechanism of rosiglitazone requires the presence of insulin; therefore, use in type 1 diabetes (insulin dependent, IDDM) or diabetic ketoacidosis is not recommended.

- Hepatic impairment: Use rosiglitazone with caution in patients with elevated transaminases (AST or ALT); do not initiate in patients with active liver disease of ALT >2.5 times the upper limit of normal (ULN) at baseline; evaluate patients with ALT ≤2.5 times ULN at baseline or during therapy for cause of enzyme elevation. During therapy, if ALT >3 times ULN, reevaluate levels promptly and discontinue if elevation persists or if jaundice occurs at any time during use. Idiosyncratic hepatotoxicity has been reported with another thiazolidinedione agent (troglitazone); avoid use in patients who previously experienced jaundice during troglitazone therapy.

- Macular edema/diabetic retinopathy: Use rosiglitazone with caution in patients with pre-existing macular edema or diabetic retinopathy; postmarketing reports of new-onset or worsening diabetic macular edema with decreased visual acuity has been reported.

- Stress-related states: It may be necessary to discontinue therapy and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Concurrent drug therapy issues:

- Hypoglycemic agents: Combination therapy with other hypoglycemic agents may increase risk for hypoglycemic events; dose reduction with the concomitant agent may be warranted.

- Insulin: Avoid use of rosiglitazone with insulin due to an increased risk of edema, congestive heart failure, and myocardial ischemic events.

- Nitrates: Concomitant use of rosiglitazone with nitrates is not recommended. An increased risk of myocardial ischemia has been observed in nitrate users versus non-nitrate users in clinical studies.

- Metformin/sulfonylureas (Canadian labeling; not in U.S. labeling): Rosiglitazone may be added to metformin or a sulfonylurea (if metformin is contraindicated or not tolerated) if glycemic control is inadequate. The use of triple therapy (rosiglitazone in combination with metformin and a sulfonylurea) is not indicated due to increased risks of congestive heart failure and fluid retention.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Premenopausal/anovulatory females: Use rosiglitazone with caution in premenopausal, anovulatory women; may result in a resumption of ovulation, increasing the risk of pregnancy.

Geriatric ConsiderationsRapid and prolonged hypoglycemia (>12 hours) despite hypertonic glucose injections have been reported; age, hepatic, and renal impairment are independent risk factors for hypoglycemia; dosage titration should be made at weekly intervals. How "tightly" a geriatric patient's blood glucose should be controlled is controversial; however, a fasting blood sugar of <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well they recognize hypoglycemic or hyperglycemic symptoms, and how to respond to them and their other disease states. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with this combination; therefore, rosiglitazone/glimepiride is classified as pregnancy category C. See individual agents.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsSee individual agents.

Pregnancy & Lactation, In-Depth

- Glimepiride in Pregnancy & Lactation
- Rosiglitazone in Pregnancy & Lactation

Adverse ReactionsPercentages below refer to combination Avandaryl®. Also see individual agents.

1% to 10%:

Cardiovascular: Edema (3%), hypertension (2% to 3%)

Central nervous system: Headache (3% to 6%)

Endocrine & metabolic: Hypoglycemia (4% to 6%)

Respiratory: Nasopharyngitis (4% to 5%)

<1%, postmarketing, and/or case reports: CHF, weight gain

Metabolism/Transport Effects

Rosiglitazone: **Substrate** of CYP2C8 (major), 2C9 (minor); **Inhibits** CYP2C8 (moderate), 2C9 (weak), 2C19 (weak), 2D6 (weak)

Glimepiride: **Substrate** of CYP2C9 (major)

Drug Interactions

Alcohol (Ethyl): Sulfonylureas may enhance the adverse/toxic effect of Alcohol (Ethyl). A flushing reaction may occur. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Antidiabetic Agents (Thiazolidinedione). *Risk D: Consider therapy modification*

Chloramphenicol: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Cyclic Antidepressants: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

CycloSPORINE: Sulfonylureas may increase the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

CYP2C8 Inducers (Highly Effective): May increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Moderate): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Strong): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Fibric Acid Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Fluconazole: May increase the serum concentration of Sulfonylureas. *Risk C: Monitor therapy*

Gemfibrozil: May decrease the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Insulin: May enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pregabalin: May enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the hypoglycemic effect of Sulfonylureas. This appears to be particularly concerning early in the course of combination therapy. Quinolone Antibiotics may diminish the hypoglycemic effect of Sulfonylureas. With longer-term combination, there is a greater risk of hyperglycemia. *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Sulfonylureas. *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Salicylates: May enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Sulfonamide Derivatives: May enhance the hypoglycemic effect of Sulfonylureas. **Exceptions:** Sulfacetamide. *Risk C: Monitor therapy*

Trimethoprim: May decrease the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Vasodilators (Organic Nitrates): May enhance the adverse/toxic effect of Rosiglitazone. Specifically, a greater risk of myocardial ischemia was reported for users of this combination in a meta-analysis. Management: Consider alternatives to this combination when possible. Rosiglitazone prescribing information states that the combination of rosiglitazone and a nitrate is not recommended. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Caution with ethanol (may cause hypoglycemia).

Herb/Nutraceutical: Caution with alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle (may cause hypoglycemia).

Monitoring ParametersHemoglobin A_{1c}, fasting serum glucose; signs and symptoms of fluid retention or heart failure, blood pressure; liver enzymes (prior to initiation of therapy, then periodically thereafter); ophthalmic exams. Evaluate patients with ALT ≤2.5 times ULN at baseline or during therapy for cause of enzyme elevation. Patients with an elevation in ALT >3 times ULN should be rechecked as soon as possible. If the ALT levels remain >3 times ULN, therapy should be discontinued. Signs and symptoms of hypoglycemia (fatigue, excessive hunger, profuse sweating, numbness of extremities).

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Nursing: Physical Assessment/Monitoring

See individual agents.

Monitoring: Lab TestsHemoglobin A_{1c}, fasting serum glucose; liver enzymes (prior to initiation of therapy, then periodically thereafter). Evaluate patients with ALT ≤2.5 times ULN at baseline or during therapy for cause of enzyme elevation. Patients with an elevation in ALT >3 times ULN should be rechecked as soon as possible. If the ALT levels remain >3 times ULN, therapy should be discontinued.

Patient Education

See individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Avandaryl® 4 mg/1 mg: Rosiglitazone maleate 4 mg and glimepiride 1 mg

Avandaryl® 4 mg/2 mg: Rosiglitazone maleate 4 mg and glimepiride 2 mg

Avandaryl® 4 mg/4 mg: Rosiglitazone maleate 4 mg and glimepiride 4 mg

Avandaryl® 8 mg/2 mg: Rosiglitazone maleate 8 mg and glimepiride 2 mg

Avandaryl® 8 mg/4 mg: Rosiglitazone maleate 8 mg and glimepiride 4 mg

Generic AvailableNo

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Tablets (Avandaryl)

4-1 mg (30): $130.43

4-2 mg (30): $131.59

4-4 mg (30): $130.43

Mechanism of Action

Rosiglitazone is a thiazolidinedione antidiabetic agent that lowers blood glucose by improving target cell response to insulin, without increasing pancreatic insulin secretion. It has a mechanism of action that is dependent on the presence of insulin for activity.

Glimepiride stimulates insulin release from the pancreatic beta cells; reduces glucose output from the liver; insulin sensitivity is increased at peripheral target sites.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Glimepiride
- Rosiglitazone

Dental Health: Effects on Dental TreatmentDependent patients with diabetes (noninsulin dependent, type 2) should be appointed for dental treatment in the morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause headache and fatigue

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine. Phenothiazines, atypical antipsychotics, and TCAs may antagonize glimepiride hypoglycemic effects; MAO inhibitors and TCAs may enhance hypoglycemic effects. Weight gain is common; caution with atypical antipsychotics, valproic acid, and lithium.

Index TermsGlimepiride and Rosiglitazone Maleate

Medication Safety Issues

Sound-alike/look-alike issues:

Avandamet® may be confused with Anzemet®

Pronunciation(roh si GLI ta zone & met FOR min)

U.S. Brand NamesAvandamet®

Canadian Brand NamesAvandamet®

Pharmacologic CategoryAntidiabetic Agent, Biguanide; Antidiabetic Agent, Thiazolidinedione

Use: Labeled IndicationsManagement of type 2 diabetes mellitus (noninsulin dependent, NIDDM) as an adjunct to diet and exercise in patients where dual rosiglitazone and metformin therapy is appropriate

Dosing: Adults**Type 2 diabetes mellitus:** Oral:

First-line therapy (drug-naive patients): Initial: Rosiglitazone 2 mg and metformin 500 mg once or twice daily; may increase by 2 mg/500 mg per day after 4 weeks to a maximum of 8 mg/2000 mg per day.

Second-line therapy:

Patients inadequately controlled on metformin alone: Initial dose: Rosiglitazone 4 mg/day plus current dose of metformin

Patients inadequately controlled on rosiglitazone alone: Initial dose: Metformin 1000 mg/day plus current dose of rosiglitazone

Note: When switching from combination rosiglitazone and metformin as separate tablets: Use current dose

Dose adjustment: Doses may be increased as increments of rosiglitazone 4 mg and/or metformin 500 mg, up to the maximum dose; doses should be titrated gradually.

After a change in the metformin dosage, titration can be done after 1-2 weeks

After a change in the rosiglitazone dosage, titration can be done after 8-12 weeks

Maximum dose: Rosiglitazone 8 mg/metformin 2000 mg daily

Dosing: ElderlyThe initial and maintenance dosing should be conservative, due to the potential for decreased renal function (monitor). Generally, elderly patients should not be titrated to the maximum. Do not use in patients ≥80 years unless normal renal function has been established.

Dosing: Renal ImpairmentDo not use with renal disease or renal dysfunction (serum creatinine ≥1.5 mg/dL in males or ≥1.4 mg/dL in females or abnormal clearance).

Dosing: Hepatic ImpairmentDo not initiate therapy with active liver disease or ALT >2.5 times the upper limit of normal.

Administration: OralAdminister with meals. Patients who are NPO may need to have their dose held to avoid hypoglycemia.

Dietary ConsiderationsShould be taken with meals. Avoid ethanol. Dietary modification based on ADA recommendations is a part of therapy. Monitor for signs and symptoms of vitamin B_{12} and/or folic acid deficiency; supplementation may be required.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsNYHA Class III/IV heart failure (initiation of therapy); renal disease or renal dysfunction (serum creatinine ≥1.5 mg/dL in males or ≥1.4 mg/dL in females, or abnormal creatinine clearance which may also result from conditions such as cardiovascular collapse, acute myocardial infarction, and septicemia); acute or chronic metabolic acidosis, including diabetic ketoacidosis (with or without coma); concurrent iodinated radiocontrast adminstration (manufacturer recommends temporary discontinuation of metformin)

Canadian labeling: Additional contraindications (not in U.S. labeling): Hypersensitivity to rosiglitazone, metformin, or any component of the formulation; any stage of heart failure (eg, NYHA Class I, II, III, or IV); history of lactic acidosis, regardless of precipitating factors; serious hepatic impairment; pregnancy

Allergy Considerations

- Biguanide Allergy
- Thiazolidinedione Allergy

Warnings/Precautions

Boxed warnings:

- Heart failure: See "Concerns related to adverse effects" below.

- Lactic acidosis: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Fractures: Increased incidence of bone fractures in females treated with rosiglitazone observed during analysis of long-term trial; majority of fractures occurred in the upper arm, hand and foot (differing from the hip or spine fractures usually associated with postmenopausal osteoporosis). Consider risk of fracture prior to initiation and during use.

- Heart failure/cardiac effects: **[U.S. Boxed Warning]: Thiazolidinediones, including rosiglitazone, may cause or exacerbate congestive heart failure;** closely monitor for signs and symptoms of congestive heart failure (eg, rapid weight gain, dyspnea, edema), particularly after initiation or dose increases. Not recommended for use in any patient with symptomatic heart failure. In the U.S., initiation of therapy is contraindicated in patients with NYHA class III or IV heart failure; in Canada use is contraindicated in patients with any stage of heart failure (NYHA I, II, III, IV). Use with caution in patients with edema; may increase plasma volume and/or cause fluid retention. A higher frequency of cardiovascular events has been noted in patients with NYHA class I or II heart failure treated with rosiglitazone. In addition, metformin should be used with caution in patients with heart failure requiring pharmacologic management, particularly in unstable or acute heart failure due to risk of lactic acidosis secondary to hypoperfusion. Rosiglitazone may also be associated with an increased risk of angina and MI. Use with caution in patients at risk for cardiovascular events and monitor closely. Discontinue if any deterioration in cardiac status occurs.

- Hematologic effects: Rosiglitazone may decrease hemoglobin, hematocrit, and/or WBC count (slight); effects may be related to increased plasma volume and/or dose-related. Use rosiglitazone with caution in patients with anemia or depressed leukocyte counts (may reduce hemoglobin, hematocrit, and/or WBC). Metformin may impair vitamin B_{12} absorption; monitor for anemia.

- Lactic acidosis: **[U.S. Boxed Warning]: Lactic acidosis is a rare, but potentially severe consequence of therapy with metformin.** Lactic acidosis should be suspected in any patient with diabetes receiving metformin with evidence of acidosis but without evidence of ketoacidosis. Discontinue metformin in clinical situations predisposing to hypoxemia, including conditions such as cardiovascular collapse, respiratory failure, acute myocardial infarction, acute congestive heart failure, and septicemia. The risk of accumulation and lactic acidosis increases with the degree of impairment of renal function.

- Weight gain: Dose-related weight gain observed with use; mechanism unknown but likely associated with fluid retention and fat accumulation.

Disease-related concerns:

- Diabetes, type 1: Mechanism of rosiglitazone requires the presence of insulin; therefore, use in type 1 diabetes (insulin dependent, IDDM) or diabetic ketoacidosis is not recommended.

- Hepatic impairment: Avoid rosiglitazone and metformin use in patients with impaired liver function due to potential for lactic acidosis with metformin. Use rosiglitazone with caution in patients with elevated transaminases (AST or ALT); do not initiate in patients with active liver disease of ALT >2.5 times the upper limit of normal (ULN) at baseline; evaluate patients with ALT ≤2.5 times ULN at baseline or during therapy for cause of enzyme elevation. During therapy, if ALT >3 times ULN, reevaluate levels promptly and discontinue rosiglitazone if elevation persists or if jaundice occurs at any time during use. Idiosyncratic hepatotoxicity has been reported with another thiazolidinedione agent (troglitazone); avoid use in patients who previously experienced jaundice during troglitazone therapy.

- Macular edema/diabetic retinopathy: Use rosiglitazone with caution in patients with pre-existing macular edema or diabetic retinopathy; postmarketing reports of new-onset or worsening diabetic macular edema with decreased visual acuity has been reported.

- Renal impairment: Metformin is substantially excreted by the kidney; patients with renal function below the limit of normal for their age should not receive therapy. Use of concomitant medications that may affect renal function (ie, affect tubular secretion) may also affect metformin disposition. Metformin should be withheld in patients with dehydration and/or prerenal azotemia.

- Stress-related states: It may be necessary to discontinue metformin and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Concurrent drug therapy issues:

- Hypoglycemic agents: Combination therapy with other hypoglycemic agents may increase risk for hypoglycemic events; dose reduction with the concomitant agent may be warranted.

- Insulin: Avoid use of rosiglitazone with insulin due to an increased risk of edema, congestive heart failure, and myocardial ischemic events.

- Nitrates: Concomitant use of rosiglitazone with nitrates is not recommended. An increased risk of myocardial ischemia has been observed in nitrate users versus non-nitrate users in clinical studies.

- Metformin/sulfonylureas (Canadian labeling; not in U.S. labeling): Rosiglitazone may be added to metformin or a sulfonylurea (if metformin is contraindicated or not tolerated) if glycemic control is inadequate. The use of triple therapy (rosiglitazone in combination with metformin and a sulfonylurea) is not indicated due to increased risks of congestive heart failure and fluid retention.

Special populations:

- Elderly: Metformin should not be initiated in patients ≥80 years of age unless normal renal function is confirmed.

- Pediatrics: Safety and efficacy have not been established in children.

- Premenopausal/anovulatory females: Use rosiglitazone with caution in premenopausal, anovulatory women; may result in a resumption of ovulation, increasing the risk of pregnancy.

Other warnings/precautions:

- Ethanol use: Instruct patients to avoid excessive acute or chronic ethanol use; ethanol may potentiate metformin's effect on lactate metabolism.
- Iodinated contrast: Metformin therapy should be temporarily discontinued prior to or at the time of intravascular administration of iodinated contrast media (potential for acute alteration in renal function). Metformin should be withheld for 48 hours after the radiologic study and restarted only after renal function has been confirmed as normal.
- Surgical procedures: Metformin therapy should be suspended 2 days prior to any surgical procedures (resume only after normal intake resumed and normal renal function is verified).

Geriatric ConsiderationsIntensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies were not conducted with this combination; therefore, rosiglitazone/metformin is classified as pregnancy category C. Refer to individual agents.

Lactation

Rosiglitazone: Excretion in breast milk unknown/not recommended

Metformin: Enters breast milk/not recommended

Breast-Feeding ConsiderationsRefer to individual agents.

Pregnancy & Lactation, In-Depth

- MetFORMIN in Pregnancy & Lactation
- Rosiglitazone in Pregnancy & Lactation

Adverse ReactionsAlso see individual agents. Percentages of adverse effects as reported with the combination product.

>10%:

Central nervous system: Headache (7% to 11%)

Gastrointestinal: Nausea/vomiting (16%), diarrhea (13% to 14%)

Respiratory: Upper respiratory tract infection (9% to 16%)

1% to 10%:

Cardiovascular: Edema (6%)

Central nervous system: Dizziness (8%), fatigue (6%)

Endocrine & metabolic: Hypoglycemia (3%)

Gastrointestinal: Dyspepsia (10%), abdominal pain (5%), loose stools (5%), constipation (5%)

Hematologic: Anemia (4% to 7%)

Neuromuscular & skeletal: Arthralgia (5%), back pain (5%)

Respiratory: Sinusitis (6%), nasopharyngitis (6%)

Miscellaneous: Injury (8%), viral infection (5%), flu-like syndrome (1%)

Metabolism/Transport EffectsRosiglitazone: **Substrate** of CYP2C8 (major), 2C9 (minor); **Inhibits** CYP2C8 (moderate), 2C9 (weak), 2C19 (weak), 2D6 (weak)

Drug Interactions

Bile Acid Sequestrants: May decrease the absorption of Antidiabetic Agents (Thiazolidinedione). *Risk D: Consider therapy modification*

Cephalexin: May increase the serum concentration of MetFORMIN. *Risk C: Monitor therapy*

Cimetidine: May decrease the excretion of MetFORMIN. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

CYP2C8 Inducers (Highly Effective): May increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Moderate): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Strong): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

Gemfibrozil: May decrease the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Insulin: May enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Iodinated Contrast Agents: May enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pregabalin: May enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Trimethoprim: May decrease the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Vasodilators (Organic Nitrates): May enhance the adverse/toxic effect of Rosiglitazone. Specifically, a greater risk of myocardial ischemia was reported for users of this combination in a meta-analysis. Management: Consider alternatives to this combination when possible. Rosiglitazone prescribing information states that the combination of rosiglitazone and a nitrate is not recommended. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsSee individual agents.

Monitoring ParametersHemoglobin A_{1c}; signs and symptoms of fluid retention or heart failure; renal function (baseline and every 6 months); blood pressure; liver enzymes (prior to initiation of therapy, then periodically thereafter). Evaluate patients with ALT ≤2.5 times ULN at baseline or during therapy for cause of enzyme elevation. Patients with an elevation in ALT >3 times ULN should be rechecked as soon as possible. If the ALT levels remain >3 times ULN, therapy with rosiglitazone should be discontinued. Serum glucose, CBC; vitamin B_{12} and folate if anemia is present. Regular ophthalmic examinations

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsSee individual components listed in Related Information.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Avandamet®: 2/500: Rosiglitazone 2 mg and metformin hydrochloride 500 mg

Avandamet®: 4/500: Rosiglitazone 4 mg and metformin hydrochloride 500 mg

Avandamet®: 2/1000: Rosiglitazone 2 mg and metformin hydrochloride 1000 mg

Avandamet®: 4/1000: Rosiglitazone 4 mg and metformin hydrochloride 1000 mg

Generic AvailableNo

ManufacturerGlaxoSmithKline Laboratories

Pricing: U.S. (www.drugstore.com)

Tablets (Avandamet)

1-500 mg (60): $67.85

2-500 mg (60): $146.21

2-1000 mg (60): $135.76

4-500 mg (60): $236.02

4-1000 mg (60): $236.02

Mechanism of ActionRosiglitazone is a thiazolidinedione antidiabetic agent that lowers blood glucose by improving target cell response to insulin, without increasing pancreatic insulin secretion. It has a mechanism of action that is dependent on the presence of insulin for activity. Metformin decreases hepatic glucose production, decreases intestinal absorption of glucose, and improves insulin sensitivity (increases peripheral glucose uptake and utilization).

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentDependent diabetics (noninsulin dependent, type 2) should be appointed for dental treatment in the morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause fatigue

Mental Health: Effects on Psychiatric TreatmentMay cause weight gain; concurrent use with psychotropics may produce additive weight gain

Index TermsMetformin and Rosiglitazone; Metformin Hydrochloride and Rosiglitazone Maleate; Rosiglitazone Maleate and Metformin Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Avandia® may be confused with Avalide®, Coumadin®, Prandin®

International issues:

Avandia® may be confused with Avanza® which is a brand name for mirtazapine in Australia

Pronunciation(roh si GLI ta zone)

U.S. Brand NamesAvandia®

Canadian Brand NamesAvandia®

Pharmacologic CategoryAntidiabetic Agent, Thiazolidinedione

Use: Labeled IndicationsType 2 diabetes mellitus (noninsulin dependent, NIDDM):

Monotherapy: Improve glycemic control as an adjunct to diet and exercise

Note: Canadian labeling approves use as monotherapy only when metformin is contraindicated or not tolerated.

Combination therapy: **Note:** Use when diet, exercise, and a single agent do not result in adequate glycemic control.

U.S. labeling: In combination with a sulfonylurea, metformin, or sulfonylurea plus metformin

Canadian labeling: In combination with metformin; in combination with a sulfonylurea only when metformin use is contraindicated or not tolerated

Use: Unlabeled/InvestigationalPolycystic ovary syndrome (PCOS)

Dosing: Adults**Type 2 diabetes:** Oral: **Note:** All patients should be initiated at the lowest recommended dose.

Monotherapy: Initial: 4 mg daily as a single daily dose or in divided doses twice daily. If response is inadequate after 8-12 weeks of treatment, the dosage may be increased to 8 mg daily as a single daily dose or in divided doses twice daily. In clinical trials, the 4 mg twice-daily regimen resulted in the greatest reduction in fasting plasma glucose and Hb A_{1c}.

Combination therapy: When adding rosiglitazone to existing therapy, continue current dose(s) of previous agents:

U.S. labeling: With sulfonylureas or metformin (or sulfonylurea plus metformin): Initial: 4 mg daily as a single daily dose or in divided doses twice daily. If response is inadequate after 8-12 weeks of treatment, the dosage may be increased to 8 mg daily as a single daily dose or in divided doses twice daily. Reduce dose of sulfonylurea if hypoglycemia occurs. It is unlikely that the dose of metformin will need to be reduced due to hypoglycemia.

Canadian labeling:

With metformin: Initial: 4 mg daily as a single daily dose or in divided doses twice daily. If response is inadequate after 8-12 weeks of treatment, the dosage may be increased to 8 mg daily as a single daily dose or in divided doses twice daily.

With a sulfonylurea: 4 mg daily as a single daily dose or in divided doses twice daily. Dose should not exceed 4 mg daily when using in combination with a sulfonylurea. Reduce dose of sulfonylurea if hypoglycemia occurs.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic ImpairmentClearance is significantly lower in hepatic impairment. Therapy should not be initiated if the patient exhibits active liver disease or increased transaminases (ALT >2.5 times the upper limit of normal) at baseline.

Dietary ConsiderationsManagement of type 2 diabetes mellitus (noninsulin dependent, NIDDM) should include diet control. May be taken without regard to meals.

StorageStore at 15°C to 30°C (59°F to 86°F). Protect from light.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

Contraindications

U.S. labeling: NYHA Class III/IV heart failure (initiation of therapy)

Canadian labeling: Hypersensitivity to rosiglitazone or any component of the formulation; any stage of heart failure (eg, NYHA Class I, II, III, IV); serious hepatic impairment; pregnancy

Allergy Considerations

- Thiazolidinedione Allergy

Warnings/Precautions

Boxed warnings:

- Heart failure/cardiac effects: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Fractures: Increased incidence of bone fractures in females treated with rosiglitazone observed during analysis of long-term trial; majority of fractures occurred in the upper arm, hand and foot (differing from the hip or spine fractures usually associated with postmenopausal osteoporosis). Consider risk of fracture prior to initiation and during use.

- Heart failure/cardiac effects: **[U.S. Boxed Warning]: Thiazolidinediones, including rosiglitazone, may cause or exacerbate congestive heart failure;** closely monitor for signs and symptoms of congestive heart failure (eg, rapid weight gain, dyspnea, edema), particularly after initiation or dose increases. Not recommended for use in any patient with symptomatic heart failure. In the U.S., initiation of therapy is contraindicated in patients with NYHA class III or IV heart failure; in Canada, use is contraindicated in patients with any stage of heart failure (NYHA I, II, III, IV). Use with caution in patients with edema; may increase plasma volume and/or cause fluid retention. A higher frequency of cardiovascular events has been noted in patients with NYHA class I or II heart failure treated with rosiglitazone. Use may also be associated with an increased risk of angina and MI. Use with caution in patients at risk for cardiovascular events and monitor closely. Discontinue if any deterioration in cardiac status occurs.

- Hematologic effects: May decrease hemoglobin, hematocrit, and/or WBC count (slight); effects may be related to increased plasma volume and/or dose-related.

- Weight gain: Dose-related weight gain observed with use; mechanism unknown but likely associated with fluid retention and fat accumulation.

Disease-related concerns:

- Anemia: Use with caution in patients with anemia; may reduce hemoglobin and hematocrit.

- Diabetes, type 1: Mechanism requires the presence of insulin; therefore, use in type 1 diabetes (insulin dependent, IDDM) or diabetic ketoacidosis is not recommended.

- Hepatic impairment: Use with caution in patients with elevated transaminases (AST or ALT); do not initiate in patients with active liver disease or ALT >2.5 times the upper limit of normal (ULN) at baseline; evaluate patients with ALT ≤2.5 times ULN at baseline or during therapy for cause of enzyme elevation; during therapy, if ALT >3 times ULN, reevaluate levels promptly and discontinue if elevation persists or if jaundice occurs at any time during use. Idiosyncratic hepatotoxicity has been reported with another thiazolidinedione agent (troglitazone); avoid use in patients who previously experienced jaundice during troglitazone therapy.

- Macular edema/diabetic retinopathy: Use with caution in patients with pre-existing macular edema or diabetic retinopathy; postmarketing events of new-onset or worsening diabetic macular edema with decreased visual acuity have been reported.

Concurrent drug therapy issues:

- Hypoglycemic agents: Combination therapy with other hypoglycemic agents may increase risk for hypoglycemic events; dose reduction with the concomitant agent may be warranted.

- Insulin: Avoid use of rosiglitazone with insulin due to an increased risk of edema, congestive heart failure, and myocardial ischemic events.

- Nitrates: Concomitant use of rosiglitazone with nitrates is not recommended. An increased risk of myocardial ischemia has been observed in nitrate users versus non-nitrate users in clinical studies.

- Metformin/sulfonylureas (Canadian labeling; not in U.S. labeling): Rosiglitazone may be added to metformin or a sulfonylurea (if metformin is contraindicated or not tolerated) if glycemic control is inadequate. The use of triple therapy (rosiglitazone in combination with metformin and a sulfonylurea) is not indicated due to increased risks of congestive heart failure and fluid retention.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Premenopausal/anovulatory females: Use with caution in premenopausal, anovulatory women; may result in a resumption of ovulation, increasing the risk of pregnancy.

Geriatric ConsiderationsNo dosage adjustment required. Due to the increased incidence of fractures in the hand, upper arm, and foot, rosiglitazone's benefits should be weighed against its risks in patients with a history of fractures, low bone mineral density, or falling. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorC

Pregnancy ConsiderationsRosiglitazone is classified as pregnancy category C due to adverse effects observed in initial animal studies. Rosiglitazone has been found to cross the placenta during the first trimester of pregnancy. Inadvertent use early in pregnancy has not shown adverse fetal effects although in the majority of cases, the medication was stopped as soon as pregnancy was detected. Thiazolidinediones may cause ovulation in anovulatory premenopausal women, increasing the risk of pregnancy; adequate contraception in premenopausal women is recommended. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Diabetes can also be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the mother and the fetus. Until additional safety and efficacy data are obtained, the use of oral agents is generally not recommended as routine management of GDM or type 2 diabetes mellitus during pregnancy. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if rosiglitazone is excreted in breast milk. Breast-feeding is not recommended by the manufacturer.

Pregnancy & Lactation, In-Depth

- Rosiglitazone in Pregnancy & Lactation

Adverse Reactions**Note:** The rate of certain adverse reactions (eg, anemia, edema, hypoglycemia) may be higher with some combination therapies.

>10%: Endocrine & metabolic: HDL-cholesterol increased, LDL-cholesterol increased, total cholesterol increased, weight gain

1% to 10%:

Cardiovascular: Edema (5%), hypertension (4%); heart failure/CHF (up to 2% to 3% in patients receiving insulin; incidence likely higher in patients with pre-existing HF; myocardial ischemia (3%; incidence likely higher in patients with preexisting CAD)

Central nervous system: Headache (6%)

Endocrine & metabolic: Hypoglycemia (1% to 3%; combination therapy with insulin: 12% to 14%)

Gastrointestinal: Diarrhea (3%)

Hematologic: Anemia (2%)

Neuromuscular & skeletal: Fractures (up to 9%; incidence greater in females; usually upper arm, hand, or foot), arthralgia (5%), back pain (4% to 5%)

Respiratory: Upper respiratory tract infection (4% to 10%), nasopharyngitis (6%)

Miscellaneous: Injury (8%)

<1%, postmarketing, and/or case reports: Anaphylaxis, angina, angioedema, bilirubin increased, blurred vision, cardiac arrest, dyspnea, coronary artery disease, coronary thrombosis, hematocrit decreased, hemoglobin decreased, hepatic failure, hepatitis, HDL-cholesterol decreased, jaundice (reversible), macular edema, MI, pleural effusion, pruritus, pulmonary edema, rash, Stevens-Johnson syndrome, thrombocytopenia, transaminases increased, urticaria, visual acuity decreased, weight gain (rapid, excessive; usually due to fluid accumulation), WBC count decreased

Note: Rare cases of hepatocellular injury have been reported in men in their 60s within 2-3 weeks after initiation of rosiglitazone therapy. LFTs in these patients revealed severe hepatocellular injury which responded with rapid improvement of liver function and resolution of symptoms upon discontinuation of rosiglitazone. Patients were also receiving other potentially hepatotoxic medications (Al-Salman, 2000; Freid, 2000).

Metabolism/Transport Effects**Substrate** of CYP2C8 (major), 2C9 (minor); **Inhibits** CYP2C8 (moderate), 2C9 (weak), 2C19 (weak), 2D6 (weak)

Drug Interactions

Bile Acid Sequestrants: May decrease the absorption of Antidiabetic Agents (Thiazolidinedione). *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

CYP2C8 Inducers (Highly Effective): May increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Moderate): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Strong): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

Gemfibrozil: May decrease the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Insulin: May enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pregabalin: May enhance the fluid-retaining effect of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Trimethoprim: May decrease the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

Vasodilators (Organic Nitrates): May enhance the adverse/toxic effect of Rosiglitazone. Specifically, a greater risk of myocardial ischemia was reported for users of this combination in a meta-analysis. Management: Consider alternatives to this combination when possible. Rosiglitazone prescribing information states that the combination of rosiglitazone and a nitrate is not recommended. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may cause hypoglycemia).

Food: Peak concentrations are lower by 28% and delayed when administered with food, but these effects are not believed to be clinically significant.

Herb/Nutraceutical: Avoid alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle (may cause hypoglycemia).

Monitoring ParametersHemoglobin A_{1c}, fasting serum glucose; signs and symptoms of fluid retention or heart failure; liver enzymes (prior to initiation of therapy, then periodically thereafter); ophthalmic exams. Evaluate patients with ALT ≤2.5 times ULN at baseline or during therapy for cause of enzyme elevation. Patients with an elevation in ALT >3 times ULN should be rechecked as soon as possible. If the ALT levels remain >3 times ULN, therapy with rosiglitazone should be discontinued.

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Nursing: Physical Assessment/MonitoringMonitor laboratory results closely. Assess other prescriptions, OTC medications, or herbal products patient may be taking. Assess for signs of fluid retention and congestive heart failure. Monitor weight. Monitor response to therapy closely until response is stable. Advise women using oral contraceptives about need for alternative method of contraception. Assess knowledge/teach risks of hyper-/hypoglycemia, its symptoms, treatment, and predisposing conditions. Refer patient to a diabetic educator, if possible. Teach appropriate use of medication, interventions to reduce side effects, and adverse reactions to report.

Monitoring: Lab TestsHemoglobin A_{1c}, serum glucose; liver enzymes (prior to initiation of therapy, then periodically thereafter). Evaluate patients with ALT ≤2.5 times ULN at baseline or during therapy for cause of enzyme elevation. Patients with an elevation in ALT >3 times ULN should be rechecked as soon as possible. If the ALT levels remain >3 times ULN, therapy with rosiglitazone should be discontinued.

Patient EducationMay be taken without regard to meals. Follow directions of prescriber. If dose is missed at the usual meal, take it with next meal. Do not double dose if daily dose is missed completely. Monitor urine or serum glucose as recommended by prescriber. More frequent monitoring is required during periods of stress, trauma, surgery, pregnancy, increased activity or exercise. Avoid alcohol. Report chest pain, rapid heartbeat or palpitations, abdominal pain, fever, rash, hypoglycemia reactions, yellowing of skin or eyes, dark urine or light stool, or unusual fatigue or nausea/vomiting. Report unusually rapid weight gain; swelling of ankles, legs, or abdomen; or weakness or shortness of breath. **Pregnancy/breast-feeding precautions:** In anovulatory, premenopausal women, ovulation may occur, increasing the risk of pregnancy. Adequate contraception is recommended. Use alternate means of contraception if using oral contraceptives. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Avandia®: 2 mg, 4 mg, 8 mg

Generic AvailableNo

ManufacturerSmithKline Beecham Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Tablets (Avandia)

2 mg (60): $152.47

4 mg (30): $120.10

8 mg (30): $223.49

Mechanism of ActionThiazolidinedione antidiabetic agent that lowers blood glucose by improving target cell response to insulin, without increasing pancreatic insulin secretion. It has a mechanism of action that is dependent on the presence of insulin for activity. Rosiglitazone is an agonist for peroxisome proliferator-activated receptor-gamma (PPARgamma). Activation of nuclear PPARgamma receptors influences the production of a number of gene products involved in glucose and lipid metabolism. Thiazolidinedione antidiabetic agent that lowers blood glucose by improving target cell response to insulin, without increasing pancreatic insulin secretion. It has a mechanism of action that is dependent on the presence of insulin for activity. PPARgamma is abundant in the cells within the renal collecting tubules; fluid retention results from stimulation by thiazolidinediones which increases sodium reabsorption.

Pharmacodynamics/Kinetics

Onset of action: Delayed; Maximum effect: Up to 12 weeks

Distribution: V_{dss} (apparent): 17.6 L

Protein binding: 99.8%; primarily albumin

Metabolism: Hepatic (99%) via CYP2C8; minor metabolism via CYP2C9

Bioavailability: 99%

Half-life elimination: 3-4 hours

Time to peak, plasma: 1 hour; delayed with food

Excretion: Urine (64%) and feces (23%) as metabolites

Dental Health: Effects on Dental TreatmentRosiglitazone-dependent patients with diabetes should be appointed for dental treatment in morning in order to minimize chance of stress-induced hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause headache and fatigue

Mental Health: Effects on Psychiatric TreatmentWeight gain is common; caution with atypical antipsychotics

Cardiovascular ConsiderationsThe glitazones are peroxisome proliferator-activated receptor gamma (PPAR gamma) agonists used to treat type 2 diabetes. Recently, there has been interest in this group's effects on cardiovascular risk. Pioglitazone has shown some promise (PROACTIVE study) in reducing a variety of cardiovascular endpoints (nonfatal MI, stroke, ACS). Rosiglitazone, however, may not be cardioprotective; Nissen and Wolski showed an association with MI and rosiglitazone use through a meta-analysis. Since that time, RECORD's interim findings (Home PD, 2007) have been published and Singh and colleagues (2007) have performed a more recent meta-analysis analyzing rosiglitazone's cardiovascular safety.

Rosiglitazone: Nissen and Wolski reviewed 42 randomized controlled studies (each > 6 months duration) in patients with type 2 diabetes or impaired glucose tolerance comparing rosiglitazone (as monotherapy or in combination regimens that may include a sulfonylurea, metformin, or insulin) to a control group (another diabetic agent or placebo). The meta-analysis tabulated the number of myocardial infarctions and cardiovascular deaths from each trial. Of the 42 studies, 38 reported at least one MI and 22 reported at least one CV related death. The meta analysis evaluated 15,560 patients who received regimens that included rosiglitazone and 12,283 patients in the comparative group without rosiglitazone. In comparing the rosiglitazone group to the control group, the odds ratio for myocardial infarction was 1.43 (95% CI 1.03 to 1.98; p=0.03). The odds ratio for death from cardiovascular disease was 1.64 (95% CI, 0.98 to 2.74; p=0.06). Rosiglitazone was associated with a significant increase risk of myocardial infarction in this pooled analysis. The clinical significance of these initial results is unclear. The study has limitations but raises safety questions that require further research to answer.

The RECORD interim evaluation was inconclusive regarding the effect of rosiglitazone on the overall risk of hospitalization or death from cardiovascular causes. Rosiglitazone was associated with an increased risk of HF. Singh's meta-analysis includes the DREAM and ADOPT data from Nissen's analysis, RECORD's interim analysis, and another small trial in patients with NYHA class I and II heart failure. All were randomized, controlled studies (each >1 year duration) in type 2 diabetics or in patients with impaired glucose tolerance. The DREAM, ADOPT, and RECORD studies excluded patients with cardiovascular disease or heart failure. All had an independent cardiology team reviewing the cardiovascular events. The numbers of cardiovascular events were small but the conclusion was that rosiglitazone was associated with a significant increased risk of MI and heart failure (HF), without a significant risk of cardiovascular mortality.

HMG-CoA Reductase Inhibitors: Evidence Does Not Suggest Increased Incidence of Amyotrophic Lateral Sclerosis (ALS) - Results of FDA Analysis - September 30, 2008

The U.S. Food and Drug Administration's (FDA) review of 41 long-term controlled clinical trials of HMG-CoA reductase inhibitors finds no evidence of an increased incidence of ALS (also known as Lou Gehrig's disease) related to these medications. This analysis occurred after the FDA had received notice of numerous adverse events of which 109 of these reports mentioned ALS, Lou Gehrig's disease, or motor neurone disease. The clinical trials included in the analysis had a median duration of treatment of 3.3 years (range of duration: 6 months to 5 years) and involved 120,964 patients. The analysis identified a total of 19 cases of ALS – 9 cases per 64,602 patients (0.014%) with statin therapy and 10 cases per 56,362 patients (0.017%) with placebo. The incidence rates, based on approximately 400,000 person-years, were 4.2 per 100,000 person-years in the statin-treated group and 5 per 100,000 person-years in the placebo-treated group.

The FDA recommends that health care providers continue to prescribe, and patients continue to use these products as described within their labeling.

For more information, healthcare professionals may refer to the following:

Pronunciation(roe soo va STAT in)

U.S. Brand NamesCrestor®

Canadian Brand NamesCrestor®

Pharmacologic CategoryAntilipemic Agent, HMG-CoA Reductase Inhibitor

Use: Labeled IndicationsUsed with dietary therapy for hyperlipidemias to reduce elevations in total cholesterol (TC), LDL-C, apolipoprotein B, nonHDL-C, and triglycerides (TG) in patients with primary hypercholesterolemia (elevations of 1 or more components are present in Fredrickson type IIa, IIb, and IV hyperlipidemias); treatment of primary dysbetalipoproteinemia (Fredrickson type III hyperlipidemia); treatment of homozygous familial hypercholesterolemia (FH); to slow progression of atherosclerosis as an adjunct to diet to lower TC and LDL-C

Dosing: Adults

Hyperlipidemia, mixed dyslipidemia, hypertriglyceridemia, primary dysbetalipoproteinemia, slowing progression of atherosclerosis: Oral:

Initial dose:

General dosing: 10 mg once daily; 20 mg once daily may be used in patients with severe hyperlipidemia (LDL >190 mg/dL) and aggressive lipid targets

Conservative dosing: Patients requiring less aggressive treatment or predisposed to myopathy (including patients of Asian descent): 5 mg once daily

Titration: After 2 weeks, may be increased by 5-10 mg once daily; dosing range: 5-40 mg/day (maximum dose: 40 mg once daily)

Note: The 40 mg dose should be reserved for patients who have not achieved goal cholesterol levels on a dose of 20 mg/day, including patients switched from another HMG-CoA reductase inhibitor.

Homozygous familial hypercholesterolemia (FH): Oral: Initial: 20 mg once daily (maximum dose: 40 mg/day)

Dosage adjustment with concomitant medications: Oral:

Cyclosporine: Rosuvastatin dose should not exceed 5 mg/day

Gemfibrozil or lopinavir/ritonavir: Rosuvastatin dose should not exceed 10 mg/day

Dosage adjustment for hematuria and/or persistent, unexplained proteinuria while on 40 mg/day: Reduce dose and evaluate causes.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Mild-to-moderate impairment: No dosage adjustment required.

Cl_{cr} <30 mL/minute/1.73 m^2: Initial: 5 mg/day; do not exceed 10 mg once daily

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered with or without food.

Dietary ConsiderationsMay be taken with or without food. Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice.

StorageStore between 20°C and 25°C (68°F to 77°F). Protect from moisture.

ContraindicationsHypersensitivity to rosuvastatin or any component of the formulation; active liver disease; unexplained persistent elevations of serum transaminases (>3 times ULN); pregnancy; breast-feeding

Allergy Considerations

- HMG-CoA Reductase Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Myopathy/rhabdomyolysis: Patients receiving HMG-CoA reductase inhibitors have developed rhabdomyolysis with acute renal failure and/or myopathy; patients should be monitored closely. This risk is dose-related and is increased with concurrent use of other lipid lowering medications. Temporarily discontinue for elective major surgery, acute medical or surgical conditions, or in any patient experiencing an acute or serious condition predisposing to renal failure (eg, sepsis, hypotension, trauma, uncontrolled seizures). Based upon current evidence, HMG-CoA reductase inhibitor therapy should be continued in the perioperative period unless risk outweighs cardioprotective benefit. Use caution in patients with renal impairment, inadequately treated hypothyroidism, and those taking other drugs associated with myopathy (eg, colchicine); these patients are predisposed to myopathy. Patients should be instructed to report unexplained muscle pain, tenderness, weakness, or brown urine.

Disease-related concerns:

- Hepatic impairment and/or ethanol use: Use with caution in patients who consume large amounts of ethanol or have a history of liver disease.

- Renal impairment: Dosage adjustment required in patients with a Cl_{cr} <30 mL/minute/1.73 m^2

Concurrent drug therapy issues:

- Cyclosporine: Cyclosporine significantly increases levels of rosuvastatin. Dose of rosuvastatin should be limited to 5 mg/day.

- Gemfibrozil: Gemfibrozil significantly increases levels of rosuvastatin. Concomitant use of gemfibrozil is not recommended. If use of gemfibrozil is warranted, dose of rosuvastatin should be limited to 10 mg/day.

- Lopinavir/ritonavir: Lopinavir/ritonavir significantly increases levels of rosuvastatin. Dose of rosuvastatin should be limited to 10 mg/day.

- Niacin: Use of niacin may increase the risk of myopathy when used with rosuvastatin. A reduction in rosuvastatin dose should be considered.

- Warfarin: Rosuvastatin significantly increases INR in patients on warfarin. INR should be monitored before starting rosuvastatin and frequently during therapy.

Special Populations:

- Asian population: Increased risk of rosuvastatin-associated myopathy in certain subgroups.

- Elderly: Use with caution in patients with advanced age, these patients are predisposed to myopathy.

- Pediatrics: Safety and efficacy have not been established. Limited experience in pediatric patients >8 years of age with homozygous FH. In patients 10-17 years of age, C_{max} and AUC were similar to that observed in adult patients receiving the same dosage.

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy.

Geriatric ConsiderationsEffective and well tolerated in the elderly. The definition of and, therefore, when to treat hyperlipidemia in geriatrics is a controversial issue. The National Cholesterol Education Program recommends that all adults maintain a plasma cholesterol <160 mg/dL. Elderly with one additional risk factor, goal LDL would be <130 mg/dL. It is the authors' belief that pharmacologic treatment be reserved for those who are unable to obtain a desirable plasma cholesterol concentration by diet alone and for whom the benefits of treatment are believed to outweigh the potential adverse effects, drug interactions, and cost of treatment.

Pregnancy Risk FactorX

Pregnancy ConsiderationsCholesterol biosynthesis may be important in fetal development. Contraindicated in pregnancy. Administer to women of childbearing potential only when conception is highly unlikely and patients have been informed of potential hazards.

LactationExcretion in breast milk unknown/contraindicated

Adverse Reactions

>10%: Neuromuscular & skeletal: Myalgia (3% to 13%)

2% to 10%:

Central nervous system: Headache (6%), dizziness (4%)

Gastrointestinal: Nausea (3%), abdominal pain (2%), constipation (2%)

Hepatic: ALT increased (2%; >3 times ULN)

Neuromuscular & skeletal: Arthralgia (10%), CPK increased (3%), weakness (3%)

<2%, postmarketing, and/or case reports: Alkaline phosphatase increased, AST increased, bilirubin increased, GGT increased, hematuria (microscopic), hepatitis, hyperglycemia; hypersensitivity reactions (including angioedema, pruritis, rash, urticaria); memory deficits, myoglobinuria, myositis, myopathy, pancreatitis, proteinuria (dose related), renal failure, rhabdomyolysis, thyroid function test abnormalities

Adverse reactions reported with other HMG-CoA reductase inhibitors include a hypersensitivity syndrome (symptoms may include anaphylaxis, angioedema, arthralgia, erythema multiforme, eosinophilia, hemolytic anemia, lupus syndrome, photosensitivity, polymyalgia rheumatica, positive ANA, purpura, Stevens-Johnson syndrome, toxic epidermal necrolysis, urticaria, vasculitis)

Metabolism/Transport Effects**Substrate** (minor) of CYP2C9, 3A4

Drug Interactions

Amiodarone: May decrease the metabolism of HMG-CoA Reductase Inhibitors. Management: Dose of HMG-CoA reductase inhibitor may need to be reduced (e.g., simvastatin prescribing information recommends not exceeding 20 mg/day during concurrent therapy). *Risk D: Consider therapy modification*

Colchicine: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Colchicine may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CycloSPORINE: May increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

DAPTOmycin: HMG-CoA Reductase Inhibitors may enhance the adverse/toxic effect of DAPTOmycin. Specifically, the risk of skeletal muscle toxicity may be increased. Management: Consider temporarily stopping HMG-CoA reductase inhibitor therapy prior to daptomycin. If used together, regular (i.e., at least weekly) monitoring of CPK concentrations is recommended. *Risk D: Consider therapy modification*

Eltrombopag: May increase the serum concentration of Rosuvastatin. Management: According to eltrombopag prescribing information, consideration should be given to a preventative 50% reduction in rosuvastatin dose when starting this combination. *Risk D: Consider therapy modification*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Fenofibrate: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Fenofibric Acid: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Gemfibrozil: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Gemfibrozil may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Niacin: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Niacinamide: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Protease Inhibitors: May increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): HMG-CoA Reductase Inhibitors may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid excessive ethanol consumption (due to potential hepatic effects).

Food: Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice.

Monitoring ParametersTotal cholesterol, LDL, and HDL cholesterol within 2-4 weeks of treatment initiation or dose change; liver function tests should be determined at baseline (prior to initiation), 3 months following initiation, 3 months after any increase in dose, and periodically thereafter (eg, semiannually); baseline CPK (recheck CPK in any patient with symptoms suggestive of myopathy)

Nursing: Physical Assessment/MonitoringUse caution with history of hepatic or renal disease. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, other lipid lowering drugs may increase risk of myopathy or rhabdomyolysis). Assess results of laboratory tests (eg, LFTS, cholesterol profile) prior to treatment and periodically thereafter. Evaluate therapeutic effectiveness and adverse reactions (eg, myalgia, CNS changes, gastrointestinal effects) on a regular basis throughout therapy. Teach patient proper use (as adjunct to diet and exercise program), possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to women of childbearing age unless they are capable of complying with effective contraceptive use. Instruct patient in appropriate contraceptive measures.

Monitoring: Lab TestsTotal cholesterol, LDL, and HDL cholesterol within 2-4 weeks of treatment initiation or dose change; liver function tests should be determined at baseline (prior to initiation), 3 months following initiation, 3 months after any increase in dose, and periodically thereafter (eg, semiannually); baseline CPK (recheck CPK in any patient with symptoms suggestive of myopathy)

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take at same time each day with or without food. Follow cholesterol-lowering diet and exercise regimen as prescribed. Avoid excess alcohol. You will have periodic blood tests to assess effectiveness. You may experience mild nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); diarrhea (buttermilk, boiled milk, or yogurt may help); constipation (increased exercise, fruit, fluids, or fiber may help); or headache, dizziness, insomnia (use caution when driving or engaged in potentially hazardous tasks until response to drug in known). Contact prescriber immediately with persistent muscle pain or cramping, skeletal or joint pain, or numbness. Report other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during and for 1 month following therapy. Consult prescriber for appropriate contraceptive measures. This drug may cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Crestor®: 5 mg, 10 mg, 20 mg, 40 mg

Generic AvailableNo

ManufacturerAstraZeneca (Canada)

Pricing: U.S. (www.drugstore.com)

Tablets (Crestor)

5 mg (30): $114.99

10 mg (30): $111.29

20 mg (30): $115.49

40 mg (30): $115.49

Mechanism of ActionInhibitor of 3-hydroxy-3-methylglutaryl coenzyme A (HMG-CoA) reductase, the rate-limiting enzyme in cholesterol synthesis (reduces the production of mevalonic acid from HMG-CoA); this then results in a compensatory increase in the expression of LDL receptors on hepatocyte membranes and a stimulation of LDL catabolism

Pharmacodynamics/Kinetics

Onset of action: Within 1 week; maximal at 4 weeks

Distribution: V_d: 134 L

Protein binding: 88%

Metabolism: Hepatic (10%), via CYP2C9 (1 active metabolite identified)

Bioavailability: 20% (high first-pass extraction by liver)

Asian patients have been noted to have increased bioavailability.

Half-life elimination: 19 hours

Time to peak, plasma: 3-5 hours

Excretion: Feces (90%), primarily as unchanged drug

Related Information

- Lipid-Lowering Agents

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentUse caution in patients who drink large amounts of alcohol; hepatotoxic effects may be enhanced

Cardiovascular Considerations

Primary Prevention: HMG-CoA reductase inhibitors are effective in primary and secondary prevention of cardiovascular events in patients with hyperlipidemia. For primary prevention, a patient's major risk factors (cigarette smoking, hypertension or currently taking antihypertensives, low HDL-C, family history, age, gender) should be evaluated. Patients with multiple risk factors (≥2) require more intensive therapy guided by the calculation of a 10-year absolute CHD risk (eg, the percent probability of having a CHD event in next 10 years). An individual's 10-year absolute CHD risk can be calculated at www.med-decisions.com/cvtool/phys/phys.html. LDL cholesterol goals, therapeutic lifestyle changes, and drug therapy are determined based upon a patient's risk factor profile.

Primary prevention trials show that cholesterol-lowering drugs reduce the risk of major coronary events, coronary death, and cerebrovascular events even in the first 6-12 months of use. The WOSCOP trial suggested a trend towards enhanced survival using pravastatin in their patients (mean LDL-cholesterol of 192 mg/dL and no history of MI). In a recent trial (Sever, 2003), patients with HTN and at least three other risk factors were randomized to 10 mg daily of atorvastatin or placebo. These patients had a total nonfasting cholesterol <250 mg/dL before treatment. LDL-C levels were 132 mg/dL before treatment and fell to an average of 90 mg/dL in the atorvastatin-treated group. There was a significant reduction in stroke, cardiovascular events, and coronary events in the atorvastatin-treated group as compared to the placebo group. There was no difference in mortality between the groups.

HMG-CoA reductase inhibitors decrease C-reactive protein (CRP), an inflammatory marker and an acute phase reactant. Elevated levels of high sensitive CRP (hsCRP), which detects CRP levels as low as 0.175 mg/L, have been shown to be associated with an increased risk of cardiovascular events. Recently, the JUPITER trial demonstrated that the use of rosuvastatin in healthy patients (men ≥50 years and women ≥60 years) without a history of cardiovascular disease with LDL <130 mg/dL and a hsCRP level ≥2 mg/L reduced the risk of major cardiovascular events (eg, nonfatal MI, stroke, death from cardiovascular causes), The number needed to treat over 5 years to prevent 1 cardiovascular event is 25. Current guidelines do not recommend drug treatment for patients with an LDL <130 mg/dL. However, identification of the patient at higher risk of cardiovascular events within this subgroup using hsCRP is now important given that statins may prevent the occurrence of these serious cardiovascular events (Ridker, 2008).

Secondary Prevention: Secondary prevention trials indicate that "statin" therapy reduces mortality, major coronary events, coronary artery procedures, and stroke. The Heart Protection Study proved that lowering serum cholesterol levels reduces the rate of major vascular events among high-risk individuals with documented vascular disease (CHD, cerebrovascular, peripheral vascular) or diabetes regardless of initial cholesterol concentrations. PROVE IT is a randomized, double-blind trial evaluating hospitalized patients with acute coronary syndrome to determine the effects of intense LDL-C lowering therapy. Four thousand patients with an LDL-C levels of 106 mg/dL were randomized to pravastatin 40 mg daily or atorvastatin 80 mg daily. After 2 years, the combined cardiovascular endpoint (death, MI, unstable angina requiring hospitalization, revascularization and stroke) was ~26% in the pravastatin patients (median LDL-C 95 mg/dL) and ~22% in the atorvastatin treated patients (median LDL-C 62 mg/dL).

LaRosa and colleagues assessed the efficacy and safety of lowering LDL cholesterol <100 mg/dL in patients with stable coronary heart disease (LaRosa, 2005). Ten thousand and one patients with baseline LDL levels <130 mg/dL were randomized to atorvastatin 10 mg or 80 mg daily and followed for a median of 4.9 years. The primary endpoint was the occurrence of the first major cardiovascular event (death from CVD, MI, resuscitation after cardiac arrest, or stroke). A primary event occurred in 434 patients (8.7%) receiving 80 mg daily (mean LDL 77 mg/dL) and 548 patients (10.9%) receiving 10 mg dose (mean LDL 101 mg/dL) (95% CI, 0.69-0.89; p <0.001). There was no mortality difference between the two treatment groups.

In addition to the ability of HMG-CoA reductase inhibitors to decrease levels of high-sensitivity C-reactive protein (hs-CRP), they also possess pleiotropic properties including improved endothelial function, reduced inflammation at the site of the coronary plaque, inhibition of platelet aggregation, and anticoagulant effects. These nonlipid effects may be beneficial when HMG-CoA reductase inhibitors are introduced early in the management of acute coronary syndromes (de Denus, 2002).

Myopathy: Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years of age), women more frequently than men, small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, drug interactions (use with caution or avoid). The combination of a HMG-CoA reductase inhibitor plus nicotinic acid seems to carry a lower risk of myopathy than does a HMG-CoA reductase inhibitor plus a fibrate. Other medications, when used concurrently, may enhance the risk of myopathy associated with statins; these include drugs that inhibit CYP3A4 isoenzymes (lovastatin, simvastatin, atorvastatin) or CYP2C9 isoenzymes (fluvastatin). HMG-CoA reductase inhibitors may exacerbate exercise-induced skeletal muscle injury. Many experts favor getting a baseline creatine kinase (CK) measurement before initiating therapy (asymptomatic CK elevations are common). Obtain a CK measurement if patient complains of muscle soreness, tenderness, or pain.

Anesthesia and Critical Care Concerns/Other ConsiderationsBased on the atorvastatin component: **Myopathy:** Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years), gender (occurs in women more frequently than men), small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, and drug interactions (use with caution or avoid).

Based on current research, HMG-CoA reductase inhibitors should be continued in the perioperative period. Postoperative discontinuation of statin therapy is associated with an increased risk of cardiac morbidity and mortality.

Rotavirus Vaccine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ROE ta vye rus vak SEEN)
U.S. Brand NamesRotarix®; RotaTeq®
Pharmacologic Category[Vaccine, Live (Viral)]
Use: Labeled IndicationsPrevention of rotavirus gastroenteritis in infants and children

The Advisory Committee on Immunization Practices (ACIP) recommends routine vaccination of all infants.

Dosing: Pediatric**Prevention of rotavirus gastroenteritis:** Oral:**Manufacturer's labeling:**

Infants 6-24 weeks of age: Rotarix®: A total of two 1mL doses, the first dose given at 6-14 weeks of age. The first and second dose should be separated by ≥4 weeks. The 2-dose series should be completed by 24 weeks of age.

Infants 6-32 weeks: RotaTeq®: A total of three 2 mL doses given at 2-, 4-, and 6 months of age; the first given at 6-14 weeks of age, followed by subsequent doses at 4- to 10-week intervals. Routine administration of the first dose at >12 weeks of age is not recommended (insufficient data). Administer all doses by 32 weeks of age. Infants who have had rotavirus gastroenteritis before getting the full course of vaccine should still initiate or complete the 3-dose schedule; initial infection provides only partial immunity.

ACIP recommendations: The first dose can be given at 6-14 weeks of age. The series should not be started in infants ≥15 weeks. The final dose in the series should be administered by 8 months 0 days of age. A total of three doses, administered at 2-, 4-, and 6 months of age, however, if Rotarix® is used at ages 2- and 4 months, a dose at 6 months is not indicated. The ACIP Provisional Recommendations for vaccination recommend completing the vaccine series with the same product whenever possible. If continuing with same product will cause vaccination to be deferred, or if product used previously is unknown, vaccination should be completed with the product available. If RotaTeq® was used in any previous doses, or if the specific product used was unknown, a total of three doses should be given

Administration: Oral

Rotarix®: Using oral applicator, administer contents into infant’s inner cheek. If most of dose is spit out or regurgitated, may administer a replacement dose at the same visit. Dispose of applicator and vaccine vial in biologic waste container.

RotaTeq®: Gently squeeze dose from ready-to-use dosing tube into infant’s inner cheek. If infant spits or regurgitates vaccine, a replacement dose is not recommended. In general, vaccine administration should be deferred for 42 days following an antibody-containing product. However, if deferral causes first dose of vaccine to be scheduled at ≥13 weeks of age, a shorter deferral interval should be used. After use, dispose of the empty tube and cap in a biologic waste container.

Administration with other vaccines:

Rotavirus vaccine with inactivated vaccines: May be given simultaneously or at any interval between doses

Rotavirus vaccine with other live vaccines:

Intranasal: If not given simultaneously, wait at least 4 weeks between administration

Injectable: May be given simultaneously or at any interval between doses of live injectable vaccines

Vaccine administration with antibody-containing products: Do not give rotavirus vaccine simultaneously. Defer rotavirus vaccine for 6 weeks after receipt of antibody containing product unless deferral will cause first dose of rotavirus vaccine to be given ≥13 weeks of age. Examples of antibody-containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products.

Dietary ConsiderationsDo not mix or dilute vaccine. May be administered before or after food, milk, or breast milk.
Storage

Rotarix®: Prior to reconstitution, store powder under refrigeration at 2°C to 8°C (36°F to 46°F); diluent may be stored at room temperature 20°C to 25°C (68°F to 77°F). Protect from light; discard if frozen. Following reconstitution, may be refrigerated or stored at room temperature for up to 24 hours. Discard if frozen.

RotaTeq®: Store and transport under refrigeration at 2°C to 8°C (36°F to 46°F). Use as soon as possible once removed from refrigerator. Protect from light.

ReconstitutionRotarix®: Reconstitute only with provided diluent and transfer adapter. Shake vigorously to form suspension.
ContraindicationsHypersensitivity to rotavirus vaccine or any component of the formulation

In addition, Rotarix® is contraindicated with a history of an uncorrected congenital malformation of the GI tract.

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine administration.

- Intussusception: Was observed with a previous licensed rotavirus vaccine; an increased risk in intussusception was not observed in clinical trials with current vaccines, however, cases have been noted in postmarketing reports. Use caution with a history of intussusception.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever).

- Gastrointestinal disease: Use with caution in infants with history of GI disorders, acute GI illness, chronic diarrhea, failure to thrive, congenital abdominal disorders, abdominal surgery, and intussusception; vaccine may be used with controlled gastroesophageal reflux disease. Consider delaying administration to infants with acute diarrhea or vomiting. Rotarix® is contraindicated with a history of an uncorrected congenital malformation of the GI tract.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Adults: Not intended for use in adults.

- Immunocompromised family members: Virus from live virus vaccines may be transmitted to nonvaccinated contacts; use with caution in the presence of immunocompromised family members.

- Immunocompromised infants: Safety and efficacy have not been established for use in immunocompromised infants (including blood dyscrasias, leukemia, lymphoma, malignant neoplasms affecting bone marrow or lymphatic system), infants on immunosuppressants (including high-dose corticosteroids; may be administered with topical corticosteroids or inhaled steroids), primary and acquired immunodeficiencies (including HIV), or infants receiving blood products or immunoglobulins within 42 days.

- Pediatrics: Safety and efficacy of RotaTeq® have not been established in infants <6 weeks or >32 weeks of age. Safety and efficacy of Rotarix® have not been established in infants <6 weeks or >24 weeks of age.

Other warnings/precautions:

- Postexposure prophylaxis: Information is not available for use in postexposure prophylaxis.

Dosage form specific issues:

- Latex: Some packaging may contain natural latex/natural rubber

Pregnancy Risk FactorC

Pregnancy Considerations

Reproduction studies have not been conducted. Not indicated for use in women of reproductive age. Infants living in households with pregnant women may be vaccinated.

Breast-Feeding ConsiderationsInfants receiving vaccine may be breast fed.

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967 or www.vaers.hhs.gov.**

Note: Ranges reported; actual percentage may vary between products.

>10%:

Central nervous system: Fever ≥38.1°C (17% to 20%; equal to placebo), irritability (3% to 11%)

Gastrointestinal: Diarrhea (4% to 24%), vomiting (3% to 15%)

Otic: Otitis media (15%)

1% to 10%:

Gastrointestinal: Flatulence (2%)

Respiratory: Nasopharyngitis (7%), bronchospasm (1%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Hematochezia, idiopathic thrombocytopenic purpura, intussusception, Kawasaki disease, seizure, urticaria

Drug Interactions

Immune Globulins: May diminish the therapeutic effect of Vaccines (Live). *Risk D: Consider therapy modification*

Immunosuppressants: May enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Tuberculin Tests: Vaccines (Live) may diminish the diagnostic effect of Tuberculin Tests. *Risk D: Consider therapy modification*

Test Interactions Tuberculin tests: Rotavirus vaccine may diminish the diagnostic effect of tuberculin tests.
Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder, for suspension, oral [preservative free; human derived]:

Rotarix®: G1P[8] $\geq 10^6$ infectious units per 1 mL [oral applicator contains natural latex/natural rubber]

Suspension, oral [preservative free; bovine and human derived]:

RotaTeq®: G1 ≥2.2 10^6 infectious units, G2 ≥2.8 10^6 infectious units, G3 ≥2.2 10^6 infectious units, G4 ≥2 10^6 infectious units, and P1 [8] ≥2.3 10^6 infectious units per 2 mL (2 mL)

Generic Available No
Mechanism of Action A live vaccine; replicates in the small intestine and promotes active immunity to rotavirus gastroenteritis. Rotarix® is specifically indicated for prevention of rotavirus gastroenteritis caused by serotypes G1, G3, G4 and G9 and RotaTeq® is specifically indicated for prevention of rotavirus gastroenteritis caused by serotypes G1, G2, G3, and G4. However, vaccines may provide immunity to other serotypes.
Pharmacodynamics/Kinetics **Note:** There is no established relationship between antibody response and protection against gastroenteritis.

Seroconversion:

Rotarix®: Antirotavirus IgA antibodies were noted 1-2 months following competition of the 2-dose series in 77% to 87% of infants.

RotaTeq®: A threefold increase in antirotavirus IgA was noted following completion of the 3-dose regimen in 93% to 100% of infants.

Duration: Following administration of rotavirus vaccine, efficacy of protecting against any grade of rotavirus gastroenteritis through two seasons was 70% to 79%

Related Information

- Immunization Recommendations

Pharmacotherapy Pearls Federal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title and address be entered into the patient's permanent medical record.
Dental Health: Effects on Dental Treatment No significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions
Mental Health: Effects on Mental Status None reported
Mental Health: Effects on Psychiatric Treatment None reported

Special Alerts

Rotigotine (Neupro®): Recall and Downward-Titration Recommendation - March 2008

Schwarz Pharma (a company of the UCB group) has issued a "Dear Healthcare Provider" letter describing steps that must be performed as a result of the nationwide recall of Neupro®. Beginning in the latter part of April 2008, Neupro® will not be available in the U.S.; therefore, patients currently receiving therapy must begin downward titration with the patches currently available. Gradual downward titration per product labeling should be done by decreasing the dose by 2 mg/24 hours every other day. Abrupt discontinuation of therapy without downward titration is **not** recommended and may result in akinetic crises or a syndrome resembling neuroleptic malignant syndrome.

The patches are being recalled secondary to the formation of rotigotine crystals (resembling snowflakes). This crystallization results in decreased drug available for absorption and altered efficacy. Patches without crystallization or minimal crystallization may be used for down-titration. Refer to the manufacturer's website for example pictures as a guide in determining if amount of crystallization is appropriate for use or not.

Additional information and example pictures of crystallization may be found at http://www.neupro.com/Home/Home.asp

Medication Safety Issues

Sound-alike/look-alike issues:

Neupro® may be confused with Neupogen®

Transdermal patch contains metal (eg, aluminum); remove patch prior to MRI.

Pronunciation(roe TIG oh teen)

U.S. Brand NamesNeupro® [DSC]

Pharmacologic CategoryAnti-Parkinson's Agent, Dopamine Agonist

Use: Labeled IndicationsTreatment of the signs and symptoms of early-stage idiopathic Parkinson's disease

Dosing: Adults**Parkinson's disease:** Topical: Transdermal: Initial: Apply 2 mg/24 hours patch once daily; may increase by 2 mg/24 hours weekly, based on clinical response and tolerability (maximum: 6 mg/24 hours)

Dosage reductions or discontinuation: Decrease by 2 mg/24 hours every other day

Note: In clinical trials, the lowest effective dose was 4 mg/24 hours and doses >6 mg/24 hours did not provide any additional therapeutic benefit and increased incidence of adverse effects

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentSevere impairment (Cl_{cr} 15-29 mL/minute): No dosage adjustment required

Dosing: Hepatic Impairment
Moderate hepatic impairment (Child-Pugh class B): No dosage adjustment required

Severe hepatic impairment: Not studied

Administration: TopicalInspect patches for formation of crystals. Do not use if crystallization is present. Apply to clean, dry, hairless area of skin on the front of the abdomen, thigh, hip, flank, shoulder, or upper arm at approximately the same time daily. Remove from pouch immediately before use and press patch firmly in place on skin for 20-30 seconds. Application sites should be rotated on a daily basis. Do not apply to same application site for more than once every 14 days or apply patch to oily, irritated or damaged skin. Avoid exposing patch to external heat sources (eg, heating pad, electric blanket, heat lamp, hot tub). If applied to hairy area, shave ≥3 days prior to applying patch. If patch detaches, immediately apply a new one to a new site.

StorageStore at 15°C to 30°C (59°F to 86°F). Store in original pouch until application.

ContraindicationsHypersensitivity to rotigotine or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Fibrosis: Rare cases of pleural, retroperitoneal fibrosis and/or cardiac valvulopathy have been reported in patients treated with ergot-derived dopamine agonists, generally with prolonged use. The potential of rotigotine, a nonergot derived dopamine agonist, to cause similar fibrotic complications is unknown.

- Hallucinations: May cause hallucinations.

- Impulsive control disorders: Dopamine agonists used for Parkinson's disease or restless legs syndrome have been associated with compulsive behaviors and/or loss of impulse control, which has manifested as pathological gambling, libido increases (hypersexuality), and/or binge eating. Causality has not been established, and controversy exists as to whether this phenomenon is related to the underlying disease, prior behaviors/addictions and/or drug therapy. Dose reduction or discontinuation of therapy has been reported to reverse these behaviors in some, but not all cases.

- Melanoma: Risk for melanoma development is increased in Parkinson's disease patients; drug causation or factors contributing to risk have not been established.

- Orthostatic hypotension: Dopamine agonists may cause orthostatic hypotension and syncope; Parkinson's disease patients appear to have an impaired capacity to respond to a postural challenge. Use with caution in patients at risk of hypotension (such as those receiving antihypertensive drugs) or where transient hypotensive episodes would be poorly tolerated (cardiovascular disease or cerebrovascular disease). Parkinson's patients being treated with dopaminergic agonists ordinarily require careful monitoring for signs and symptoms of postural hypotension, especially during dose escalation, and should be informed of this risk.

- Somnolence: Use commonly associated with somnolence. In addition, patients falling asleep during activities of daily living, including driving, have also been reported and may occur without significant warning signs. Monitor for daytime somnolence or pre-existing sleep disorder. Patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). Use with caution in patients receiving other CNS depressants or psychoactive agents; discontinue if significant daytime sleepiness or episodes of falling asleep occur. Effects with other sedative drugs or ethanol may be potentiated.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with pre-existing cardiovascular disease; therapy has been associated with inconsistent increases in blood pressure (as well as orthostatic hypotension), increased heart rate (average increase of 2-4 bpm), and fluid retention.

- Dyskinesia: Use with caution in patients with pre-existing dyskinesia; therapy may exacerbate.

Special populations:

- Pediatrics: Safety and effectiveness have not been established in children <18 years of age.

Dosage form specific issues:

- Aluminum: Patch contains aluminum; remove patch prior to magnetic resonance imaging or cardioversion to avoid skin burns

- Sulfites: Patch contains sodium metabisulfite which may cause allergic reaction in susceptible individuals.

Other warnings/precautions:

- Appropriate use: Patients should rotate application sites to reduce incidence of application site reactions. Reactions increasing in severity, spreading outside of application site or persistent reactions (lasting longer than several days) prompt assessment and any generalized skin reaction require discontinuation of therapy. Patients should be instructed to avoid patch exposure to heat sources; heat application may result in several fold increases in drug absorption.

- Discontinuation of therapy: Taper treatment when discontinuing therapy; do not stop abruptly. Other dopaminergic agents have been associated with a syndrome resembling neuroleptic malignant syndrome on withdrawal and/or significant dosage reduction.

Geriatric ConsiderationsIn clinical trials, no differences in efficacy or safety were seen in younger and older patients. Plasma concentrations of rotigotine in patients 65-80 years of age were similar to younger patients. Plasma concentrations were not measured in patients >80 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsFetal death and adverse effects on embryo-fetal development were observed in some, but not all animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsProlactin secretion may be inhibited.

Adverse Reactions

>10%:

Central nervous system: Somnolence (13% to 25%), dizziness (18%), headache (14%), insomnia (6% to 14%)

Gastrointestinal: Nausea (34% to 48%), vomiting (10% to 20%)

Local: Application site reactions (21% to 37%)

1% to 10%:

Cardiovascular: Sinus tachycardia (9%), peripheral edema (7%), orthostatic hypotension (5% to 7%), hypertension (3%), syncope

Central nervous system: Fatigue (8%), abnormal dreams (2% to 5%), hallucination (≤3%), vertigo (3%), ataxia, confusion, fever, hypoesthesia, malaise

Dermatologic: Erythematous rash (2% to 6%), contact dermatitis, pruritus, purpura

Endocrine & metabolic: Hypoglycemia (7%)

Gastrointestinal: Constipation (dose related; 5%), dyspepsia (4%), anorexia (dose related; 3%), xerostomia (3%), weight gain (3%), weight loss (≤2%)

Genitourinary: Urinary tract infection (3%), urinary incontinence

Hematologic: Hemoglobin decreased

Hepatic: Albumin decreased, GGT increased

Neuromuscular & skeletal: Back pain (6%), arthralgia (4%), myalgia (≤2%), abnormal gait, hypertonia, leg pain, neuralgia, paresthesia

Ocular: Vision changes (dose related; 3%)

Respiratory: Sinusitis (3%)

Miscellaneous: Accident (5%), diaphoresis increased (4%)

<1%, postmarketing, and/or case reports: Allergic reaction, appetite increased, atrial fibrillation, AV block, BUN increased, bundle branch block, flushing, heart failure, hot flashes, hyperesthesia, impotence, paranoia, psychosis, photopsia, rigors, saliva increased, seizure, sexual urgency, thrombocytopenia, tinnitus, ventricular arrhythmia, ventricular tachycardia

Reported with dopamine agonists: Impulsive/compulsive behaviors (eg, pathological gambling, hypersexuality, binge eating)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antipsychotics (Atypical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Antipsychotics (Typical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Metoclopramide: May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Monitoring ParametersBlood pressure (orthostatic); daytime alertness; periodic skin evaluations (melanoma development)

Nursing: Physical Assessment/MonitoringAssess other prescription and OTC medications patient may be taking to avoid duplications and interactions. Monitor therapeutic response and adverse reactions at the beginning and periodically throughout therapy. Taper dosage slowly when discontinuing. Do not discontinue abruptly. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Patient EducationInform prescriber of all prescription medications, OTC medications, or herbal products you are taking. Avoid alcohol; may increase drowsiness. Patch contains aluminum. Remove patch prior to magnetic resonance imaging or cardioversion to avoid skin burns. Avoid exposure of patch to heat sources. You may experience drowsiness or dizziness, even when performing activities of daily living (do not drive or engage in tasks requiring alertness until response to drug is known); loss of impulse control (possibly manifested as pathological gambling, libido increases, and/or binge eating); nausea (small, frequent meals, frequent oral care, sucking lozenges, or chewing gum may help); orthostatic hypotension (use caution when changing position from lying or sitting to standing); headache; or insomnia. Report rapid heart beat, unexplained weight gain (>3-5 pounds/week), swelling of extremities, shortness of breath, suicide ideation, compulsive behavior and trouble controlling strong urges, generalized skin reaction, or hallucinations. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Transdermal system [once-daily patch]:

Neupro®:

2 mg/24 hours (7s, 30s) [10 cm^2, total rotigotine 4.5 mg; contains sodium metabisulfite] [DSC]

4 mg/24 hours (7s, 30s) [20 cm^2, total rotigotine 9 mg; contains sodium metabisulfite] [DSC]

Generic AvailableNo

ManufacturerSchwarz Pharma

Pricing: U.S. (www.drugstore.com)

Patch, 24-hour (Neupro)

6 mg/24 hrs (30): $264.99

Mechanism of ActionRotigotine is a nonergot dopamine agonist with specificity for D_3-, D_2-, and D_1-dopamine receptors. Although the precise mechanism of action of rotigotine is unknown, it is believed to be due to stimulation of postsynaptic dopamine D_2-type auto receptors within the substantia nigra in the brain, leading to improved dopaminergic transmission in the motor areas of the basal ganglia, notably the caudate nucleus/putamen regions.

Pharmacodynamics/Kinetics

Distribution: V_d: 84 L/kg

Protein binding: ~90%

Metabolism: Extensive conjugation and N-dealkylation

Half-life elimination: After removal of patch: ~5-7 hours

Time to peak, plasma: 15-18 hours; can occur 4-27 hours post application

Excretion: Urine (~71% as metabolites, <1% as unchanged drug); feces (~11%)

Medication Safety Issues

Sound-alike/look-alike issues:

Meruvax® II may be confused with Attenuvax®

Pronunciation(rue BEL a VYE rus vak SEEN, live)
U.S. Brand NamesMeruvax® II
Pharmacologic CategoryVaccine
Use: Labeled IndicationsSelective active immunization against rubella

Note: Trivalent measles - mumps - rubella (MMR) vaccine is the preferred immunizing agent for most children and many adults.

Dosing: Adults**Immunization:** SubQ: 0.5 mL

Adults without documentation of immunity: Vaccination is recommended for students entering colleges and other institutions of higher education, for military personal, for healthcare workers, for international travelers who visit endemic areas, and to women of childbearing potential. Do not administer to women who may become pregnant within 4 weeks of receiving vaccine; administer following completion or termination of pregnancy

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Immunization:** SubQ: Children ≥12 months: Primary immunization is recommended at 12-15 months; revaccination with MMR-II at 4-6 years of age is recommended prior to elementary school. Previously unvaccinated children of susceptible pregnant women should be vaccinated.
Administration: I.V.Not for I.V. administration.
Administration: OtherSubQ injection only in outer aspect of upper arm; avoid injection into blood vessel. **Not for I.V. administration.**
StorageVaccine is to be shipped at 10°C (50°F). May use dry ice. Protect from light at all times. Prior to reconstitution, store at 2°C to 8°C (36°F to 46°F) or colder. Discard reconstituted vaccine after 8 hours.
ContraindicationsHypersensitivity to rubella vaccine or any component of the vaccine; history of anaphylactic reactions to neomycin; individuals with blood dyscrasias, leukemia, lymphomas, or other malignant neoplasms affecting the bone marrow or lymphatic systems; concurrent immunosuppressive therapy (not including steroid replacement); primary and acquired immunodeficiency states; family history of congenital or hereditary immunodeficiency; active/untreated tuberculosis; current febrile illness; pregnancy
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use. Use extreme caution in patients with immediate-type hypersensitivity reactions to eggs.

- Neomycin sensitivity: Contact dermatitis to neomycin is not a contraindication to the vaccine.

Disease-related concerns:

- Acute illness: The manufacturer contraindicates use with febrile infections; however, the ACIP notes that patients with minor illnesses with or without fever (diarrhea, mild upper respiratory tract infection, otitis media) may receive vaccines.

- Thrombocytopenia: Use with caution in patients with thrombocytopenia and those who develop thrombocytopenia after first dose; thrombocytopenia may worsen.

- Tuberculosis: Therapy to treat tuberculosis should be started prior to administering vaccine to patients with untreated, active tuberculosis.

Concurrent drug therapy issues:

- Immune globulins: Recent administration of immune globulins may interfere with immune response.

Special populations:

- Altered immunocompetence: Use is contraindicated in severely immunocompromised patients (eg, patients receiving chemo-/radiation therapy or other immunosuppressive therapy (including high-dose corticosteroids)); may have a reduced response to vaccination. Patients with HIV infection, who are asymptomatic and not severely immunosuppressed may be vaccinated. Patients with leukemia who are in remission and who have not received chemotherapy for at least 3 months may be vaccinated.

- Healthcare workers: Acceptable evidence of immunity is recommended healthcare workers at time of employment.

- Pediatrics: Safety and efficacy have not been established in children <12 months of age.

- Students: Acceptable evidence of immunity is recommended for students entering institutions of higher learning.

- Travelers to endemic areas: Acceptable evidence of immunity is recommended for travelers to endemic areas.

Dosage form specific issues:

- Albumin: Products may contain albumin.

- Gelatin: Products may contain gelatin.

- Neomycin: Products may contain neomycin.

Other warnings/precautions:

- Blood products: Recent administration of blood or blood products may interfere with immune response.

Geriatric ConsiderationsNot a vaccine necessary for most adults and elderly; however, necessary to protect persons without immunity traveling into endemic or epidemic countries. May need to test for rubella immunity if no record of disease of vaccination is available.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Women who are pregnant when vaccinated or who become pregnant within 28 days of vaccination should be counseled on the theoretical risks to the fetus. The risk of rubella-associated malformations in these women is so small as to be negligible. MMR is the vaccine of choice if recipients are likely to be susceptible to measles or mumps as well as to rubella. Evidence of rubella immunity should be determined in women of childbearing potential.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsFollowing vaccination in the mother, rubella virus may be transmitted to the nursing infant via breast milk. Infants may show serologic evidence of infection, however, severe disease is not expected.

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Frequency not defined.

Cardiovascular: Syncope, vasculitis

Central nervous system: Dizziness, encephalitis, fever, Guillain-Barré syndrome, headache, irritability, malaise, polyneuritis, polyneuropathy

Dermatologic: Angioneurotic edema, erythema multiforme, pruritus, purpura, rash, Stevens-Johnson syndrome, urticaria

Gastrointestinal: Diarrhea, nausea, sore throat, vomiting

Hematologic: Leukocytosis, thrombocytopenia

Local: Injection site reactions which include burning, induration, pain, redness, stinging, wheal and flare

Neuromuscular & skeletal: Arthralgia/arthritis (variable; highest rates in women, 12% to 26% versus children, up to 3%), myalgia, paresthesia

Ocular: Conjunctivitis, optic neuritis, papillitis, retrobulbar neuritis

Otic: Nerve deafness, otitis media

Respiratory: Bronchial spasm, cough, rhinitis

Miscellaneous: Anaphylactoid reactions, anaphylaxis, regional lymphadenopathy

Drug Interactions

Immune Globulins: May diminish the therapeutic effect of Vaccines (Live). *Risk D: Consider therapy modification*

Immunosuppressants: May enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Tuberculin Tests: Vaccines (Live) may diminish the diagnostic effect of Tuberculin Tests. *Risk D: Consider therapy modification*

Test InteractionsMay depress tuberculin skin test sensitivity

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Meruvax® II: ≥1000 TCID_{50} (Wistar RA 27/3 Strain) [contains gelatin, human albumin, sorbitol, sucrose, and neomycin]

Generic AvailableNo

ManufacturerMerck & Co

Mechanism of ActionRubella vaccine is a live attenuated vaccine that contains the Wistar Institute RA 27/3 strain, which is adapted to and propagated in human diploid cell culture. Promotes active immunity by inducing rubella hemagglutination-inhibiting antibodies.

Pharmacodynamics/KineticsOnset of action: Antibodies to vaccine: 2-4 weeks

Related Information

- Immunization Recommendations

Pharmacotherapy PearlsLive virus vaccine. Federal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent record.

Acceptable presumptive evidence of immunity includes one of the following:

1. Documentation of adequate vaccination
2. Laboratory evidence of immunity
3. Documentation of physician-diagnosed disease

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness, irritability, or malaise
Mental Health: Effects on Psychiatric TreatmentNone reported
Mental Health CommentMay cause encephalitis, Guillain-Barré syndrome, polyneuritis, and polyneuropathy.

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Pronunciation(roo FIN a mide)
U.S. Brand NamesBanzel™
Pharmacologic CategoryAnticonvulsant, Triazole Derivative
Use: Labeled IndicationsAdjunctive therapy in the treatment of generalized seizures of Lennox-Gastaut syndrome
Dosing: Adults**Lennox-Gastaut (adjunctive):** Oral: Initial: 400-800 mg/day in 2 equally divided doses; increase dose by 400-800 mg/day every 2 days until maximum daily dose: 3200 mg/day in 2 equally divided doses
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Lennox-Gastaut (adjunctive):** Children ≥4 years: Oral: Initial: 10 mg/kg/day in 2 equally divided doses; increase dose by ~10 mg/kg/day every other day to a target dose of 45 mg/kg/day **or** 3200 mg/day (whichever is lower) in 2 equally divided doses
Dosing: Renal Impairment

Cl_{cr} <30 mL/minute: No dosage adjustment needed.

Hemodialysis: No specific guidelines available; consider dosage adjustment for loss of drug.

Dosing: Hepatic Impairment
Mild-to-moderate impairment: Use caution.

Severe impairment: Use in severe impairment has not been studied and is not recommended.

Administration: OralAdminister with food. Tablets may be split in half or crushed.
Dietary ConsiderationsTake with food.
StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from moisture.
RestrictionsAn FDA-approved patient medication guide is available and must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.
ContraindicationsPatients with familial short QT syndrome
Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: Has been associated with shortening of the QT interval. Use caution in patients receiving concurrent medications that shorten the QT interval. Contraindicated in patients with familial short-QT syndrome.

- CNS effects: Use has been associated with CNS-related adverse events, most significant of these were cognitive symptoms (including somnolence or fatigue) and coordination abnormalities (including ataxia, dizziness, and gait disturbances). Caution patients about performing tasks which require mental alertness (eg, operating machinery or driving).

- Multiorgan hypersensitivity reactions: Potentially serious, sometimes fatal, multiorgan hypersensitivity reactions have been reported with some antiepileptic drugs, including rufinamide; monitor for signs and symptoms of possible disparate manifestations associated with lymphatic, hepatic, renal, and/or hematologic organ systems; gradual discontinuation and conversion to alternate therapy may be required.

- Rash: Closely monitor any patient who develops a rash; instruct patients to report any rash associated with fever.

- Suicidal ideation: Antiepileptics may increase the risk of suicidal ideation. Monitor patients closely for unusual changes in mood or behavior, worsening depression, or suicidal behavior or thoughts. Caregivers and families should also be educated to watch for these signs and symptoms and notify healthcare provider if signs/symptoms develop.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with mild to moderate impairment; use in not recommended in patients with severe impairment.

Concurrent drug therapy issues:

- Contraceptive failure: Concurrent use with hormonal contraceptives may lead to contraceptive failure.

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Other warnings/precautions:

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal. Reducing dose by ~25% every two days was effective in trials.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse effects were seen in animal studies. There are no adequate and well-controlled studies in pregnant women; use during pregnancy only if clearly needed. Hormonal contraceptives may be less effective with concurrent rufinamide use; additional forms of nonhormonal contraceptives should be used.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsExcretion into breast milk is unknown, but may be expected. Breast-feeding is not recommended by the manufacturer due to the potential for adverse effects in the nursing infant.

Adverse Reactions

>10%:

Cardiovascular: QT shortening (46% to 65%; dose related)

Central nervous system: Headache (16% to 27%), somnolence (11% to 24%), dizziness (3% to 19%), fatigue (9% to 16%)

Gastrointestinal: Vomiting (5% to 17%), nausea (7% to 12%)

1% to 10%:

Central nervous system: Ataxia (4 % to 5%), seizure (children 5%), status epilepticus (up to 4%), aggression (children 3%), anxiety (adults 3%), attention disturbance (children 3%), hyperactivity (children 3%), vertigo (adults 3%)

Dermatologic: Rash (children 4%), pruritus (children 3%)

Gastrointestinal: Appetite decreased (≥1% to 5%), abdominal pain (3%), constipation (adults 3%), dyspepsia (adults 3%), appetite increased (≥1%)

Hematologic: Leukopenia (≤4%), anemia (≥1%)

Neuromuscular & skeletal: Tremor (adults 6%), back pain (adults 3%), gait disturbance (1% to 3%)

Ocular: Diplopia (4% to 9%), blurred vision (adults 6%), nystagmus (adults 6%)

Otic: Otitis media (children 3%)

Renal: Pollakiuria (≥1%)

Respiratory: Nasopharyngitis (≥5%), bronchitis (children 3%), sinusitis (children 3%)

Miscellaneous: Influenza (children 5%)

<1%, postmarketing, and/or case reports: Atrioventricular block (first degree), bundle branch block (right), dysuria, enuresis, hematuria, incontinence, iron-deficiency anemia, lymphadenopathy, nephrolithiasis, neutropenia, nocturia, polyuria, thrombocytopenia, urinary incontinence

In addition, multiorgan hypersensitivity (including rash, urticaria, facial edema, fever, eosinophilia, stuporous state, severe hepatitis, LFTs increased) has been reported.

Drug Interactions

CarBAMazepine: Rufinamide may decrease the serum concentration of CarBAMazepine. CarBAMazepine may decrease the serum concentration of Rufinamide. *Risk C: Monitor therapy*

Ethinyl Estradiol: Rufinamide may decrease the serum concentration of Ethinyl Estradiol. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Norethindrone: Rufinamide may decrease the serum concentration of Norethindrone. *Risk D: Consider therapy modification*

PHENobarbital: Rufinamide may increase the serum concentration of PHENobarbital. PHENobarbital may decrease the serum concentration of Rufinamide. *Risk C: Monitor therapy*

Phenytoin: Rufinamide may increase the serum concentration of Phenytoin. Phenytoin may decrease the serum concentration of Rufinamide. *Risk C: Monitor therapy*

Primidone: May decrease the serum concentration of Rufinamide. *Risk C: Monitor therapy*

Valproic Acid: May increase the serum concentration of Rufinamide. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Food increases the absorption of rufinamide.

Herb/Nutraceutical: Avoid evening primrose (seizure threshold decreased).

Monitoring ParametersSeizure (frequency and duration); serum levels of concurrent anticonvulsants

Monitoring: Lab TestsSerum levels of concurrent anticonvulsants

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Banzel™: 200 mg, 400 mg

Generic AvailableNo

ManufacturerEisai Co, Ltd

Mechanism of ActionA triazole-derivative antiepileptic whose exact mechanism is unknown. *In vitro*, it prolongs the inactive state of the sodium channels, thereby limiting repetitive firing of sodium-dependent action potentials mediating anticonvulsant effects.

Pharmacodynamics/Kinetics

Absorption: Slow; extensive ≥85%; increased with food

Distribution: V_d: ~50 L

Protein binding: 34%, primarily to albumin

Metabolism: Extensively via carboxylesterase-mediated hydrolysis of the carboxylamide group to CGP 47292 (inactive metabolite); weak inhibitor of CYP2E1 and weak inducer of CYP3A4

Bioavailability: Extent decreased with increased dose

Half-life elimination: ~6-10 hours

Time to peak, plasma: 4-6 hours

Excretion: Urine (85%, ~66% as CGP 47292, <2% as unchanged drug)

Dental Health Professional ConsiderationsRufinamide is known to prolong the QT interval. The QT interval is measured as the time and distance between the Q point of the QRS complex and the end of the T wave in the ECG tracing. After adjustment for heart rate, the QT interval is defined as prolonged if it is more than 450 msec in men and 460 msec in women. A long QT syndrome was first described in the 1950s and 60s as a congenital syndrome involving QT interval prolongation and syncope and sudden death. Some of the congenital long QT syndromes were characterized by a peculiar electrocardiographic appearance of the QRS complex involving a premature atria beat followed by a pause, then a subsequent sinus beat showing marked QT prolongation and deformity. This type of cardiac arrhythmia was originally termed “torsade de pointes” (translated from the French as “twisting of the points”).

Prolongation of the QT interval is thought to result from delayed ventricular repolarization. The repolarization process within the myocardial cell is due to the efflux of intracellular potassium. The channels associated with this current can be blocked by many drugs and predispose the electrical propagation cycle to torsade de pointes.

Rufinamide is considered as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. It is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsRufinamde may prolong QT interval resulting in cardiac conduction problems; it is not known what effect vasoconstrictors will have in patients taking medications that could prolong QT interval. It is suggested that the clinician consult with the physician prior to use of vasoconstrictor in suspected patients; use vasoconstrictor with caution.

Saccharomyces boulardii

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(sak roe MYE sees boo LAR dee)

U.S. Brand NamesFlorastor® Kids [OTC]; Florastor® [OTC]

Pharmacologic CategoryDietary Supplement; Probiotic

Use: Labeled IndicationsPromote maintenance of normal microflora in the gastrointestinal tract; used in management of bloating, gas, and diarrhea, particularly to decrease the incidence of diarrhea associated with antibiotic use

Dosing: Adults**Dietary supplement:** Oral: Dosing varies by manufacturer; consult product labeling.

Florastor®: 250 mg twice daily

Dosing: ElderlyRefer to adult dosing. Use caution in debilitated patients.

Dosing: Pediatric**Dietary supplement:** Oral: Dosing varies by manufacturer; consult product labeling.

Florastor® Kids: 250 mg twice daily

Dietary ConsiderationsFlorastor® and Florastor® Kids: Contain lactose; may be given with or without food.

StorageSome preparations may need to be refrigerated or stored in freezer; consult individual product labeling.

Florastor®, Florastor® Kids: Store at ≤25°C (≤77°F); refrigeration not necessary.

ContraindicationsHypersensitivity to *Saccharomyces boulardii* or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Yeast allergy: Use with caution in patients allergic to yeast; *S. boulardii* is a live yeast preparation and a subtype of the species, *S. cervasiae*, which is also referred to as “baker’s yeast” or “brewer’s yeast.”

Concurrent drug therapy issues:

- Antifungals: Avoid use in patients with concurrent systemic antifungals; *S. boulardii* may be susceptible.

Special populations:

- Immunocompromised patients: Use with caution or avoid use in immunocompromised, debilitated, or critically ill patients, particularly those with a central venous catheter and/or previous or current antibiotic therapy; *S. boulardii*, although a nonpathogenic yeast, use has been associated with case reports of fungemia in this population.

Dosage form specific issues:

- Lactose: Some products may contain lactose; use with caution in patients with lactose intolerance.
- Various preparations: Significant differences may exist from one preparation of *S. boulardii* compared to another with respect to biologic activity and composition.

Other warnings/precautions:

- Dietary supplement: Probiotics are classified as dietary supplements; therefore, there are no safety reviews or approved therapeutic indications by the FDA. There is no conclusive evidence to support widespread use in the treatment of diarrhea.

Geriatric ConsiderationsUse caution in debilitated patients.

Adverse ReactionsFrequency not defined.

Gastrointestinal: Constipation, flatulence

Miscellaneous: Thirst

Postmarketing and/or case reports: Fungemias

Drug Interactions

Antifungal Agents: May diminish the therapeutic effect of Saccharomyces boulardii. **Exceptions:** Butenafine; Butoconazole; Ciclopirox; Econazole; Gentian Violet; Iodoquinol; Naftifine; Natamycin; Oxiconazole; Povidone-Iodine; Sertaconazole; Sulconazole; Sulfanilamide; Terconazole; Tioconazole; Tolnaftate; Triacetin; Undecylenic Acid. *Risk D: Consider therapy modification*

Patient EducationMay cause constipation, bloating, or excessive gas. Consult prescriber if unable to manage independently.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, oral:

Florastor®: *S. boulardii lyo* 250 mg [provides 5 billion live cells; contains lactose 32.5 mg and magnesium 2.85 mg per capsule]

Powder, oral:

Sacrosidase (Sucraid®): Manufacturing Change May Lead to an Increase in Papain-Induced Hypersensitivity Reactions - December 2008

To prevent any shortages of sacrosidase (Sucraid®) oral solution, the Food and Drug Administration (FDA) has allowed for a manufacturing change which permits QOL Medical, the sole manufacturer of Sucraid®, to obtain the active ingredient, sacrosidase, from a different manufacturer. However, the newly manufactured product may contain increased levels of papain, which may be introduced during the manufacturing process performed to obtain sacrosidase. Steps are taken to remove any papain contamination, but there is no assurance that papain has been completely eliminated from the final product. Papain exposure has been associated with severe hypersensitivity reactions, including anaphylaxis. Tachycardia and hypotension have also been observed in association with some papain-induced hypersensitivity reactions. In addition, some data also suggest a possible cross-sensitivity may exist between patients with natural rubber latex hypersensitivity and papaya, the source of papain.

For additional information, refer to:

> http://www.fda.gov/bbs/topics/NEWS/2008/NEW01915.html
>
> http://www.fda.gov/cder/news/papain/qa.htm

Pronunciation(sak ROE si dase)
U.S. Brand NamesSucraid®
Canadian Brand NamesSucraid®
Pharmacologic CategoryEnzyme, Gastrointestinal
Use: Labeled Indications**Orphan drug:** Oral replacement therapy in sucrase deficiency, as seen in congenital sucrase-isomaltase deficiency (CSID)
Dosing: Adults**Sucrase deficiency:** Oral: 17,000 int. units (2 mL) per meal or snack. Doses should be diluted with 2-4 ounces of water, milk or formula with each meal or snack. Approximately one-half of the dose may be taken before, and the remainder of a dose taken at the completion of each meal or snack.
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Infants ≥5 months and Children <15 kg: Oral: 8500 int. units (1 mL) per meal or snack

Children >15 kg: Refer to adult dosing.

Administration: OralDo not administer with fruit juices, warm or hot liquids; the solution is fully soluble with water, milk, or formula
StorageStore under refrigeration at 2°C to 8°C (36°F to 46°F). Protect from heat or light. After initial opening, discard any unused product after 4 weeks.
RestrictionsSucraid® is not available in retail pharmacies or via mail-order pharmacies. To obtain the product, please refer to http://www.sucraid.net/ or call 1-866-740-2743.
ContraindicationsHypersensitivity to yeast, yeast products, or glycerin
Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: Hypersensitivity reactions to sacrosidase, including bronchospasm, have been reported. Administer initial doses in a setting where acute hypersensitivity reactions may be treated within a few minutes. Skin testing for hypersensitivity may be performed prior to administration to identify patients at risk.

Dosage form specific issues

- Papain: Product may contain papain. Severe hypersensitivity reactions, including anaphylaxis, have been observed with papain exposure. Tachycardia and hypotension, in association with some papain-induced hypersensitivity reactions, has also been observed. In addition, inconclusive data suggests a possible cross-sensitivity may exist between patients with natural rubber latex hypersensitivity and papaya, the source of papain.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal studies have not been conducted. Should be administered to a pregnant woman only when indicated.
LactationEnters breast milk/compatible
Adverse Reactions

1% to 10%: Gastrointestinal: Abdominal pain, constipation, diarrhea, nausea, vomiting

<1%: Bronchospasm, dehydration, headache, hypersensitivity reaction, insomnia, nervousness

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb InteractionsFood: May be inactivated or denatured if administered with fruit juice, warm or hot food or liquids. Since isomaltase deficiency is not addressed by supplementation of sacrosidase, adherence to a low-starch diet may be required.

Nursing: Physical Assessment/MonitoringHypersensitivity reactions can occur (including bronchospasm), administer initial dose where adverse reactions can be treated immediately; skin testing for hypersensitivity may be performed prior to administering first dose to identify patients at risk. Monitor effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationUse exactly as directed. Dilute dose in 2-4 oz of water, milk, or formula; do not dilute with fruit juice or warm or cold liquids. Take half the dose at beginning of meal and half the dose at end of meal. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Follow prescribers recommended diet exactly. You may experience headache or nervousness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea, vomiting, or GI disturbance (frequent mouth care, chewing gum, or sucking hard candy may help). Report immediately skin rash or respiratory difficulty; persistent vomiting, abdominal pain, or blood in stools; change in CNS status (depression, agitation, lethargy); or other adverse response. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral:

Sucraid®: 8500 int. units per mL (118 mL)

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (Sucraid)

8500 units/mL (118): $347.32

Mechanism of ActionSacrosidase is a naturally-occurring gastrointestinal enzyme which breaks down the disaccharide sucrose to its monosaccharide components. Hydrolysis is necessary to allow absorption of these nutrients.

Pharmacodynamics/Kinetics

Absorption: Amino acids

Metabolism: GI tract to individual amino acids

Pharmacotherapy PearlsOral solution contains 50% glycerol. Oral solution may contain papain, an enzyme used during the manufacturing process to obtain sacrosidase.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Pharmacologic CategoryAcne Products; Keratolytic Agent; Topical Skin Product, Acne

Use: Labeled IndicationsTopically for its keratolytic effect in controlling seborrheic dermatitis or psoriasis of body and scalp, dandruff, and other scaling dermatoses; also used to remove warts, corns, and calluses; acne

Dosing: Adults

Acne:

Cream, cloth, foam, or liquid cleansers (2%): Use to cleanse skin once or twice daily. Massage gently into skin, work into lather and rinse thoroughly. Cloths should be wet with water prior to using and disposed of (not flushed) after use.

Gel (0.5% or 2%): Apply small amount to face in the morning or evening; if peeling occurs, may be used every other day. Some products may be labeled for OTC use up to 3 or 4 times per day. Apply to clean, dry skin

Pads (0.5% or 2%): Use pad to cover affected area with thin layer of salicylic acid one to three times a day. Apply to clean, dry skin. Do not leave pad on skin.

Patch (2%): At bedtime, after washing face, allow skin to dry at least 5 minutes. Apply patch directly over pimple being treated. Remove in the morning.

Shower/bath gels or soap (2%): Use once daily in shower or bath to massage over skin prone to acne. Rinse well.

Callus, corns, or warts:

Gel or liquid (17%): Apply to each wart and allow to dry. May repeat once or twice daily, up to 12 weeks. Apply to clean dry area.

Gel (6%): Apply to affected area once daily, generally used at night and rinsed off in the morning.

Plaster or transdermal patch (40%): Apply directly over affected area, leave in place for 48 hours. Some products may be cut to fit area or secured with adhesive strips. May repeat procedure for up to 12 weeks. Apply to clean, dry skin

Transdermal patch (15%): Apply directly over affected area at bedtime, leave in place overnight and remove in the morning. Patch should be trimmed to cover affected area. May repeat daily for up to 12 weeks.

Dandruff, psoriasis, or seborrheic dermatitis:

Cream (2.5%): Apply to affected area 3-4 times daily. Apply to clean, dry skin. Some products may be left in place overnight.

Ointment (3%): Apply to scales or plaques on skin up to 4 times per day (not for scalp or face)

Shampoo (1.8% to 3%): Massage into wet hair or affected area; leave in place for several minutes; rinse thoroughly. Labeled for OTC use 2-3 times a week, or as directed by healthcare provider. Some products may be left in place overnight.

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren: Refer to adult dosing.

Consult specific product labeling for use in children <12 years.

ContraindicationsHypersensitivity to salicylic acid or any component of the formulation
Allergy Considerations

- Salicylate Allergy/Sensitivity

Warnings/Precautions

Disease-related concerns:

- Diabetes: Prior to OTC use, consult with healthcare provider if you have diabetes.

- Poor circulation: Prior to OTC use, consult with healthcare provider if have poor circulation.

Other warnings/precautions:

- Appropriate use: For external use only; not for application to areas that are irritated, infected, reddened, birthmarks, genital or facial warts, eyes or mucous membranes.

Geriatric ConsiderationsNo specific considerations are needed if used according to recommended doses and duration of use. Many elderly may have diabetes or impaired circulation and avoidance of topical salicylic acid would be advised.
Pregnancy Risk FactorC
Adverse ReactionsFrequency not defined.

Central nervous system: Dizziness, mental confusion, headache

Local: Burning and irritation at site of exposure on normal tissue, peeling, scaling

Otic: Tinnitus

Respiratory: Hyperventilation

Drug InteractionsThere are no known significant interactions.

Mechanism of ActionProduces desquamation of hyperkeratotic epithelium via dissolution of the intercellular cement which causes the cornified tissue to swell, soften, macerate, and desquamate. Salicylic acid is keratolytic at concentrations of 3% to 6%; it becomes destructive to tissue at concentrations >6%. Concentrations of 6% to 60% are used to remove corns and warts and in the treatment of psoriasis and other hyperkeratotic disorders.

Pharmacodynamics/Kinetics

Absorption: Percutaneous; systemic toxicity unlikely with normal use

Time to peak, serum: Within 5 hours of application with occlusion

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause confusion

Mental Health: Effects on Psychiatric TreatmentNone reported

Saliva Substitute

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(sa LYE va SUB stee tute)

U.S. Brand NamesAquoral™; Caphosol®; Entertainer's Secret® [OTC]; Moi-Stir® [OTC]; Mouthkote® [OTC]; Numoisyn™; Oasis®; Oral Balance® [OTC]; Saliva Substitute® [OTC] [DSC]; Salivart® [OTC]; SalivaSure™ [OTC]

Pharmacologic CategoryGastrointestinal Agent, Miscellaneous

Use: Labeled IndicationsRelief of dry mouth and throat in xerostomia or hyposalivation; adjunct to standard oral care in relief of symptoms associated with chemotherapy or radiation therapy-induced mucositis

Use: DentalRelief of dry mouth and throat in xerostomia

Dosing: Adults

Mucositis (due to high-dose chemotherapy or radiation therapy): Caphosol®: Swish and spit 4-10 doses per day beginning at onset of chemo- or radiation therapy

Xerostomia: Oral: Use as needed, or product-specific dosing:

Caphosol®: Swish and spit 2-10 doses per day

Numoisyn™ liquid: Use 2 mL as needed

Numoisyn™ lozenges: Dissolve 1 lozenge in mouth as needed; maximum 16 lozenges/day

Oasis® mouthwash: Rinse mouth with ~30 mL twice daily or as needed; do not swallow

Oasis® spray: 1-2 sprays as needed; maximum 60 sprays/day

Oral Balance®: Use after meals, at bedtime, and as needed

Dosing: ElderlyRefer to adult dosing.

Administration: Oral

Caphosol®: Mix contents of 1 blue (A) and 1 clear (B) ampul in clean container, swish thoroughly with $^{1}/_{2}$ of mixture (15 mL) for 1 minute and spit; repeat. Avoid eating or drinking for at least 15 minutes after use.

Numoisyn™ liquid: Rinse in mouth before swallowing.

Numoisyn™ lozenges: Dissolve slowly in mouth.

Oasis® mouthwash: Rinse for 30 seconds.

Oasis® spray: Spray into mouth holding bottle upright; do not rinse.

Dietary ConsiderationsCaphosol®: Contains sodium 75 mg/30 mL dose

Storage

Caphosol®: Store at room temperature; do not refrigerate.

Numoisyn™ liquid: Store at room temperature; do not refrigerate. Use within 3 months after opening.

Numoisyn™ lozenges: Store at room temperature.

ReconstitutionCaphosol®: Mix contents of 1 blue (A) and 1 clear (B) ampul in clean container; use immediately after mixing.

Geriatric ConsiderationsSaliva production has not been shown to change with aging, however, many drugs used by elderly can cause dry mouth. These patients may benefit from a saliva substitute.

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Liquid:

Numoisyn™: Water, sorbitol, linseed extract, *Chondrus crispus*, methylparaben, sodium benzoate, potassium sorbate, dipotassium phosphate, propylparaben (300 mL)

Oral Balance®: Water, starch, sunflower oil, propylene glycol, xylitol, glycerine, purified milk extract (45 mL) [sugar-free]

Lozenge:

Numoisyn™: Sorbitol 0.3 g/lozenge, polyethylene glycol, malic acid, sodium citrate, calcium phosphate dibasic, hydrogenated cottonseed oil, citric acid, magnesium stearate, silicon dioxide (100s)

SalivaSure™: Xylitol, citric acid, apple acid, sodium citrate dihydrate, sodium carboxymethylcellulose, dibasic calcium phosphate, silica colloidal, magnesium stearate, stearic acid (90s)

Solution, oral:

Caphosol®: Dibasic sodium phosphate 0.032%, monobasic sodium phosphate 0.009%, calcium chloride 0.052%, sodium chloride 0.569%, purified water (30 mL) [packaged in two 15 mL ampuls when mixed together provide one 30 mL dose]

Entertainer's Secret®: Sodium carboxymethylcellulose, aloe vera gel, glycerin (60 mL) [alcohol-free; honey-apple flavor]

Saliva Substitute®: Sorbitol, sodium carboxymethylcellulose, methylparaben (120 mL) [alcohol free, dye free, sugar free; mild mint flavor] [DSC]

Solution, oral [mouthwash/gargle]:

Oasis®: Water, glycerin, sorbitol, poloxamer 338, PEG-60, hydrogenated castor oil, copovidone, sodium benzoate, carboxymethycellulose (473 mL) [alcohol free, sugar free; mild mint flavor]

Solution, oral [preservative free; spray]:

Salivart®: Water, sodium carboxymethylcellulose, sorbitol, sodium chloride, potassium chloride, calcium chloride, magnesium chloride, potassium phosphate (74 mL) [alcohol free]

Solution, oral [spray]:

Aquoral™: Oxidized glycerol triesters and silicon dioxide (40 mL) [contains aspartame; delivers 400 sprays, citrus flavor]

Moi-Stir®: Water, sorbitol, sodium carboxymethylcellulose, methylparaben, propylparaben, potassium chloride, dibasic sodium phosphate, calcium chloride, magnesium chloride, sodium chloride (120 mL)

Mouthkote®: Water, xylitol, sorbitol, yerba santa, citric acid, ascorbic acid, sodium saccharin, sodium benzoate (5 mL, 60 mL, 240 mL) [alcohol free, sugar free; lemon-lime flavor]

Oasis®: Glycerin, cetylpyridinium, copovidone (30 mL) [alcohol free, sugar free; contains sodium benzoate; delivers ~150 sprays, mild mint flavor]

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Salmeterol may be confused with Salbutamol, Solu-Medrol®

Serevent® may be confused with Atrovent®, Combivent®, Serentil®, sertraline, Sinemet®, Spiriva®, Zoloft®

Pronunciation(sal ME te role)

U.S. Brand NamesSerevent® Diskus®

Canadian Brand NamesSerevent® Diskhaler® Disk; Serevent® Diskus®

Pharmacologic CategoryBeta$_2$ Agonist; Beta$_2$-Adrenergic Agonist, Long-Acting

Use: Labeled IndicationsMaintenance treatment of asthma; prevention of bronchospasm with reversible obstructive airway disease, including patients with symptoms of nocturnal asthma; prevention of exercise-induced bronchospasm; maintenance treatment of bronchospasm associated with COPD

Dosing: Adults

Asthma, maintenance and prevention: Inhalation, powder (50 mcg/inhalation): One inhalation twice daily (~12 hours apart); maximum: 1 inhalation twice daily. **Note:** For long-term asthma control, long acting beta$_2$-agonists (LABAs) should be used in combination with inhaled corticosteroids and not as monotherapy.

Exercise-induced asthma, prevention: Inhalation, powder (50 mcg/inhalation): One inhalation at least 30 minutes prior to exercise; additional doses should not be used for 12 hours; should not be used in individuals already receiving salmeterol twice daily. **Note:** Because LABAs may disguise poorly controlled persistent asthma, frequent or chronic use of LABAs for exercise-induced bronchospasm is discouraged by the NIH Asthma Guidelines (NIH, 2007).

COPD maintenance: Inhalation, powder (50 mcg/inhalation): One inhalation twice daily (~12 hours apart); maximum: 1 inhalation twice daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Asthma (maintenance/prevention) and exercise-induced asthma (prevention):** Inhalation, powder (50 mcg/inhalation): Children ≥4 years: Refer to adult dosing.

Dosing: Hepatic ImpairmentNo dosage adjustment required; manufacturer suggests close monitoring of patients with hepatic impairment.

Administration: Inhalation**Not** to be used for the relief of acute attacks. Not for use with a spacer device. Administer with Diskus® in a level, horizontal position. Do not wash mouthpiece; Diskus® should be kept dry.

Dietary ConsiderationsPowder for oral inhalation contains lactose; very rare anaphylactic reactions have been reported in patients with severe milk protein allergy.

StorageInhalation powder (Serevent® Diskus®): Store at controlled room temperature 20°C to 25°C (68°F to 77°F) in a dry place away from direct heat or sunlight. Stable for 6 weeks after removal from foil pouch.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to salmeterol or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Asthma-related deaths: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Asthma-related deaths: **[U.S. Boxed Warning]: Long-acting beta$_2$-agonists (LABAs) may increase the risk of asthma-related deaths. Salmeterol should only be used as adjuvant therapy in patients not adequately controlled on inhaled corticosteroids or whose disease requires two maintenance therapies.** In a large, randomized clinical trial (SMART, 2006), salmeterol was associated with a small, but statistically significant increase in asthma-related deaths (when added to usual asthma therapy); risk may be greater in African-American patients versus Caucasians.

- Bronchospasm: Rarely, paradoxical bronchospasm may occur with use of inhaled bronchodilating agents; this should be distinguished from inadequate response.

- Hypersensitivity reactions: Immediate hypersensitivity reactions (urticaria, angioedema, rash, bronchospasm) have been reported.

- Serious effects/fatalities: Do not exceed recommended dose; serious adverse events, including fatalities, have been associated with excessive use of inhaled sympathomimetics.

- Upper airway symptoms: There have been reports of laryngeal spasm, irritation, swelling (stridor, choking) with use.

Disease-related concerns:

- Asthma: Appropriate use: Do **not** use for acute asthmatic symptoms. Short-acting beta$_2$-agonist (eg, albuterol) should be used for acute symptoms and symptoms occurring between treatments. Do **not** initiate in patients with significantly worsening or acutely deteriorating asthma; reports of severe (sometimes fatal) respiratory events have been reported when salmeterol has been initiated in this situation. Salmeterol should only be used as adjuvant therapy in patients not adequately controlled on inhaled corticosteroids or whose disease requires two maintenance therapies. Corticosteroids should not be stopped or reduced when salmeterol is initiated. Salmeterol is not a substitute for inhaled or systemic corticosteroids and should not be used as monotherapy. During the initiation of salmeterol watch for signs of worsening asthma.

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (arrhythmia, hypertension or HF); beta-agonists may cause elevation in blood pressure, heart rate and result in CNS stimulation/excitation. Beta$_2$-agonists may also increase risk of arrhythmias.

- Diabetes: Use with caution in patients with diabetes mellitus; beta$_2$-agonists may increase serum glucose.

- Exercise-induced bronchospasm: Because LABAs may disguise poorly controlled persistent asthma, frequent or chronic use of LABAs for exercise-induced bronchospasm is discouraged by the NIH Asthma Guidelines (NIH, 2007).

- Glaucoma: Use with caution in patients with glaucoma; may elevate intraocular pressure.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Hyperthyroidism: Use with caution in hyperthyroidism; may stimulate thyroid activity.

- Hypokalemia: Use with caution in patients with hypokalemia; beta$_2$-agonists may decrease serum potassium.

- Seizures: Use with caution in patients with seizure disorders; beta-agonists may result in CNS stimulation/excitation.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <4 years of age.

Dosage form specific issues:

- Lactose: Powder for oral inhalation contains lactose; very rare anaphylactic reactions have been reported in patients with severe milk protein allergy.

Other warnings/precautions:

- Patient information: Patients must be instructed to use inhaled short-acting beta$_2$-agonists (eg, albuterol) for acute asthmatic or COPD symptoms and to seek medical attention in cases where acute symptoms are not relieved or a previous level of response is diminished. The need to increase frequency of use of inhaled short-acting beta$_2$-agonist may indicate deterioration of asthma, and treatment must not be delayed. Salmeterol should not be used more than twice daily; do not use with other long-acting beta$_2$-agonists.

Geriatric ConsiderationsGeriatric patients were included in four clinical studies of salmeterol; no apparent differences in efficacy and safety were noted in geriatric patients compared to younger adults. Because salmeterol is only to be used for prevention of bronchospasm, patients also need a short-acting beta-agonist to treat acute attacks. Elderly patients should be carefully counseled about which inhaler to use and the proper scheduling of doses.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have demonstrated (dose-dependent) teratogenicity. There are no adequate and well-controlled studies in pregnant women. Beta-agonists may interfere with uterine contractility if administered during labor. Use only if clearly needed.

LactationEnters breast milk/use caution

Adverse Reactions

>10%:

Central nervous system: Headache (13% to 17%)

Neuromuscular & skeletal: Pain (1% to 12%)

1% to 10%:

Cardiovascular: Hypertension (4%), edema (1% to 3%), pallor

Central nervous system: Dizziness (4%), sleep disturbance (1% to 3%), fever (1% to 3%), anxiety (1% to 3%), migraine (1% to 3%)

Dermatologic: Rash (1% to 4%), contact dermatitis (1% to 3%), eczema (1% to 3%), urticaria (3%), photodermatitis (1% to 2%)

Endocrine & metabolic: Hyperglycemia (1% to 3%)

Gastrointestinal: Throat irritation (7%), nausea (1% to 3%), dyspepsia (1% to 3%), dental pain (1% to 3%), gastrointestinal infection (1% to 3%), oropharyngeal candidiasis (1% to 3%), xerostomia (1% to 3%)

Neuromuscular & skeletal: Muscular cramps/spasm (3%), articular rheumatism (1% to 3%), arthralgia (1% to 3%), joint pain (1% to 3%), muscular stiffness (1% to 3%), paresthesia (1% to 3%), rigidity (1% to 3%)

Ocular: Keratitis/conjunctivitis (1% to 3%)

Respiratory: Nasal congestion (4% to 9%), tracheitis/bronchitis (7%), pharyngitis (≤6%), cough (5%), influenza (5%), viral respiratory tract infection (5%), sinusitis (4% to 5%), rhinitis (4% to 5%), asthma (3% to 4%)

<1%, postmarketing, and/or case reports: Abdominal pain, agitation, aggression, anaphylactic reaction (Diskus®: severe milk allergy), angioedema, aphonia, arrhythmia, atrial fibrillation, bronchospasm and immediate bronchospasm, cataracts, chest congestion, chest tightness, choking, contusions, Cushing syndrome, Cushingoid features, depression, dysmenorrhea, dyspnea, earache, ecchymoses, edema (facial, oropharyngeal), eosinophilic conditions, glaucoma, growth velocity reduction in children/adolescents, hypercorticism, hypersensitivity reaction (immediate and delayed), hypokalemia, hypothyroidism, intraocular pressure increased, laryngeal spasm/irritation, irregular menstruation, myositis, osteoporosis, pallor, paradoxical tracheitis, paranasal sinus pain, PID, restlessness, stridor, supraventricular tachycardia, syncope, tremor, vaginal candidiasis, vaginitis, vulvovaginitis, rare cases of vasculitis (Churg-Strauss syndrome), ventricular tachycardia, weight gain

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)
Drug Interactions

Alpha-/Beta-Blockers: May diminish the therapeutic effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Atomoxetine: May enhance the tachycardic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Betahistine: May diminish the therapeutic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Monitoring ParametersFEV_1, peak flow, and/or other pulmonary function tests; blood pressure, heart rate; CNS stimulation. Monitor for increased use of short-acting beta$_2$-agonist inhalers; may be marker of a deteriorating asthma condition.
Nursing: Physical Assessment/MonitoringNot for use to relieve acute asthmatic attacks. Use caution in presence of cardiovascular disease, seizures disorder, diabetes, glaucoma, hyperthyroidism, hepatic impairment, or hypokalemia. Assess other pharmacological or herbal products patient may be taking for potential interactions or toxicity. Assess effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Evaluate for increased use of short-acting beta$_2$-agonist inhalers; may be marker of a deteriorating asthma condition. For inpatient care, monitor vital signs and lung sounds prior to and periodically during therapy. An FDA medication guide must be distributed when new or refill prescription is dispensed. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Monitoring: Lab TestsFEV_1, peak flow, and/or other pulmonary function tests
Patient EducationThis medication is not to be used as a rescue treatment for acute asthmatic symptoms. You will be provided with a medication guide; read this guide carefully. Do not take any new prescription or over-the-counter medications, or herbal products during therapy without consulting prescriber. Use exactly as directed; do not alter dose or decrease without consulting prescriber. Do not use more often than recommended (excessive use may result in tolerance, overdose may result in serious adverse effects) and do not discontinue without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, check blood sugar regularly; blood glucose level may be affected. You may experience headache, nervousness, dizziness, or fatigue (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or dry mouth, stomach upset (small frequent meals, frequent mouth care, chewing gum, or sucking hard candy may help). Report immediately any swelling of face, tongue, or throat, rash, difficulty swallowing or choking. Report unresolved GI upset; dizziness or fatigue; vision changes; chest pain, rapid heartbeat, or palpitations; insomnia; nervousness or hyperactivity; muscle cramping, tremors, or pain; unusual cough; or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Powder for oral inhalation:

Serevent® Diskus®: Salmeterol xinafoate 50 mcg (28s, 60s) [delivers 50 mcg/inhalation; contains lactose]

Serevent® Diskhaler® Disk [CAN]: Salmeterol xinafoate 50 mcg (60s) [delivers 50 mcg/inhalation; contains lactose] [not available in U.S]

Generic AvailableNo
ManufacturerGlaxoSmithKline
Pricing: U.S. (www.drugstore.com)

Aerosol powder (Serevent Diskus)

50 mcg/dose (60): $153.62

Mechanism of ActionRelaxes bronchial smooth muscle by selective action on beta$_2$-receptors with little effect on heart rate; salmeterol acts locally in the lung.

Pharmacodynamics/Kinetics

Onset of action: Asthma: 30-48 minutes, COPD: 2 hours

Peak effect: Asthma: 3 hours, COPD: 2-5 hours

Duration: 12 hours

Absorption: Systemic: Inhalation: Undetectable to poor

Protein binding: 96%

Metabolism: Hepatic; hydroxylated via CYP3A4

Half-life elimination: 5.5 hours

Time to peak, serum: ~20 minutes

Excretion: Feces (60%), urine (25%)

Related Information

- Bronchodilators
- Inhalant Agents

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), dental pain, and oropharyngeal candidiasis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness, dizziness, hyperactivity, or insomnia

Mental Health: Effects on Psychiatric TreatmentSalmeterol is a sympathomimetic; use MAO inhibitors and TCAs with caution

Cardiovascular ConsiderationsInhaled beta-agonists may increase heart rate. This should be considered in patients with disease states that may require heart rate control (eg, atrial fibrillation) since frequent use may counteract pharmacologic interventions directed at rate control.

Because of the frequent coexistence of chronic obstructive lung disease and coronary artery disease, many patients may require concurrent therapy with beta-agonists and beta-blockade. Selectivity for the beta-1 receptor varies among the available beta blockers. Cardioselective beta blockade (eg, atenolol, esmolol, metoprolol) with careful titration is preferred when this situation exists (Anderson, 2007). When an inhaled beta-agonist becomes necessary, monitor heart rate closely.

Index TermsSalmeterol Xinafoate

Salsalate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Salsalate may be confused with sucralfate, sulfasalazine

Pronunciation(SAL sa late)

U.S. Brand NamesAmigesic® [DSC]

Canadian Brand NamesAmigesic®; Salflex®

Pharmacologic CategorySalicylate

Use: Labeled IndicationsTreatment of minor pain or fever; arthritis

Dosing: Adults**Pain, inflammation (arthritis):** Oral: 3 g/day in 2-3 divided doses

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentPatients with end-stage renal disease undergoing hemodialysis: Administer 750 mg twice daily with an additional 500 mg after dialysis.

Dietary ConsiderationsMay be taken with food to decrease GI distress.

ContraindicationsHypersensitivity to salsalate or any component of the formulation; GI ulcer or bleeding; pregnancy (3rd trimester)

Allergy Considerations

- Salicylate Allergy/Sensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Salicylate sensitivity: Patients with sensitivity to tartrazine dyes, nasal polyps, and asthma may have an increased risk of salicylate sensitivity. Previous nonreaction does not guarantee future safe taking of medication.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with platelet and bleeding disorders.
- Dehydration: Use with caution in patients with dehydration.
- Gastrointestinal disease: Use with caution in patients with erosive gastritis or peptic ulcer.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Pediatrics: Children and teenagers who have or are recovering from chickenpox or flu-like symptoms should not use this product. Changes in behavior (along with nausea and vomiting) may be an early sign of Reye's syndrome; patients should be instructed to contact their healthcare provider if these occur.

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from NSAIDs. As much as 60% of the elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucinations are generally seen in overdose or high dose situations, but elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorC/D (3rd trimester)

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsSalsalate is metabolized to salicylate which is contraindicated while breast-feeding.

Adverse Reactions

>10%: Gastrointestinal: Nausea, heartburn, stomach pain, dyspepsia

1% to 10%:

Central nervous system: Fatigue

Dermatologic: Rash

Gastrointestinal: Gastrointestinal ulceration

Hematologic: Hemolytic anemia

Neuromuscular & skeletal: Weakness

Respiratory: Dyspnea

Miscellaneous: Anaphylactic shock

<1%: Bronchospasm, hepatotoxicity, impaired renal function, insomnia, iron-deficiency anemia, jitters, leukopenia, nervousness, occult bleeding, thrombocytopenia; does not appear to inhibit platelet aggregation

Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

NSAID (Nonselective): May enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Diclofenac. *Risk D: Consider therapy modification*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Salsalate peak serum levels may be delayed if taken with food.

Herb/Nutraceutical: Avoid cat's claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, red clover, horse chestnut, green tea, ginseng (all have additional antiplatelet activity).

Test InteractionsFalse-negative results for glucose oxidase urinary glucose tests (Clinistix®); false-positives using the cupric sulfate method (Clinitest®); also, interferes with Gerhardt test, VMA determination; 5-HIAA, xylose tolerance test and T_3 and T_4

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. Assess effectiveness and interactions of other medications patient may be taking. Monitor blood pressure at the beginning of therapy and periodically during use. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions (eg, GI effects, unusual bleeding, hepatotoxicity) at beginning of therapy and periodically throughout therapy. Schedule ophthalmic evaluations for patients who are on long-term NSAID therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake this medication exactly as directed; do not increase dose without consulting prescriber. Do not crush tablets. Take with food or milk to reduce GI distress. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Do not use alcohol, aspirin or aspirin-containing medication, or any other anti-inflammatory medications without consulting prescriber. You may experience drowsiness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea or heartburn (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). GI bleeding, ulceration, or perforation can occur with or without pain; discontinue medication and contact prescriber if persistent abdominal pain or cramping, or blood in stool occurs. Report breathlessness or respiratory difficulty; chest pain; unusual bruising or bleeding; blood in urine, stool, mouth, or vomitus; unusual fatigue; skin rash or itching; change in urinary pattern; or change in hearing or ringing in ears. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 3rd trimester of pregnancy. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet: 500 mg, 750 mg

Amigesic®: 500 mg [DSC], 750 mg [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Salsalate)

500 mg (100): $15.99

750 mg (60): $13.99

Mechanism of ActionWeakly inhibits cyclooxygenase enzymes, which result in decreased formation of prostaglandin precursors; antipyretic, analgesic, and anti-inflammatory properties.

Pharmacodynamics/Kinetics

Onset of action: Therapeutic: 3-4 days of continuous dosing

Absorption: Complete from small intestine

Metabolism: Hepatically hydrolyzed to two moles of salicylic acid (active)

Half-life elimination: 7-8 hours

Excretion: Primarily urine

Pharmacotherapy PearlsDoes not appear to inhibit platelet aggregation; salsalate causes less GI and renal toxicity than aspirin and other NSAIDs

Dental Health: Effects on Dental TreatmentNSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness; may rarely cause nervousness or insomnia

Mental Health: Effects on Psychiatric TreatmentMay rarely cause leukopenia; use caution with clozapine and carbamazepine

Anesthesia and Critical Care Concerns/Other ConsiderationsSalsalate does not appear to inhibit platelet aggregation.

Index TermsDisalicylic Acid; Salicylsalicylic Acid

Sapropterin

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Sapropterin may be confused with cyproterone

Pronunciation(sap roe TER in)

U.S. Brand NamesKuvan™

Pharmacologic CategoryEnzyme Cofactor

Use: Labeled IndicationsAdjunct to dietary management in the treatment of tetrahydrobiopterin (BH4) responsive phenylketonuria (PKU)

Dosing: Adults**PKU:** Oral: Initial: 10 mg/kg once daily; adjust after 1 month based on blood phenylalanine levels (if phenylalanine levels do not decrease from baseline, increase dose to 20 mg/kg once daily); discontinue if phenylalanine levels do not decrease after 1 month of treatment at 20 mg/kg/day (nonresponder). Maintenance range: 5-20 mg/kg once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**PKU:** Children ≥4 years: Refer to adult dosing.

Administration: OralAdminister with food, preferably at the same time each day. Dissolve tablets in 120-240 mL (4-8 oz) water or apple juice. May crush or stir to aid in dissolution. Take within 15 minutes of dissolution. Tablets may not dissolve completely; rinse remaining tablet residue (with more water or apple juice) and drink.

Dietary ConsiderationsPatients should maintain adherence to a phenylalanine-restricted diet. Take with food to increase absorption.

StorageStore at 20°C to 25°C (68°F to 77°F); excursions to 15°C to 30°C (59°F to 86°F) permitted. Protect from moisture.

ContraindicationsThere are no contraindications listed in the manufacturer's labeling

Warnings/Precautions

Concerns related to adverse effects:

- Allergic reaction: Although severe allergic reactions were not observed in clinical trials, do not administer to patients with allergy to any component of the formulation. Patients with mild-to-moderate allergy (eg, rash) should be evaluated for risk versus benefit prior to continuing therapy.

Disease-related concerns:

- Hepatic impairment: Has not been studied in patients with hepatic impairment. Monitor carefully; hepatic damage has been associated with impaired phenylalanine metabolism.

- Phenylketonuria: Phenylalanine levels should be monitored and maintained within the target range during sapropterin treatment. Low levels of phenylalanine are associated with catabolism and protein breakdown. Dietary management of phenylalanine intake is required to ensure nutritional balance and adequate phenylalanine control.

- Renal impairment: Has not been studied in patients with renal impairment; use with caution.

Concurrent drug therapy issues:

- Folic acid antagonists: Folic acid antagonists (eg, methotrexate) may decrease tetrahydrobiopterin (BH4) levels via dihydropteridine reductase enzyme inhibition.

- Levodopa: In sapropterin clinical studies for a non-PKU use, seizure, over stimulation, and irritability were reported in patients also receiving levodopa; use caution.

- PDE-5 inhibitors: Use with caution with medications that affect nitric oxide-mediated vasorelaxation, including PDE-5 inhibitors (eg, sildenafil, tadalafil, vardenafil); additive effect may lead to hypotension. Sapropterin use has not been evaluated in combination with PDE-5 inhibitors.

Special populations:

- Nonresponders: Response to sapropterin treatment is established through treatment (cannot be predetermined by lab testing). Patients whose phenylalanine levels do not decrease after treatment at 20 mg/kg/day for 1 month are considered nonresponders.

- Pediatrics: Safety and efficacy have not been established in children <4 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsStatistically significant teratogenic effects were not observed in animal studies; however, there are no adequate and well-controlled studies in pregnant women. High levels of maternal phenylalanine are associated with congenital heart disease, developmental delay, facial dysmorphism, learning difficulties, and microcephaly. Phenylalanine concentrations should be normalized prior to conception and dietary control with proper supplementation are recommended during pregnancy. Some clinicians recommend that dietary control be achieved for at least 4 weeks prior to conception; however, studies suggest that as long as control is achieved by 10 weeks of pregnancy, teratogenic effects of untreated maternal phenylketonuria can be decreased. The effects of sapropterin on pregnancy have not been determined. Pregnant women exposed to sapropterin are encouraged to enroll in the Kuvan™ pregnancy registry.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if sapropterin is found in breast milk. Phenylalanine and tyrosine are natural components of human milk and are amino acids required for normal development. The effects of sapropterin have not been determined.

Adverse Reactions

>10%:

Central nervous system: Headache (15%)

Respiratory: Rhinorrhea (11%)

1% to 10%:

Gastrointestinal: Diarrhea (8%), vomiting (8%), nausea

Dermatologic: Bruising (5%)

Hematologic: Neutropenia (4%)

Respiratory: Pharyngolaryngeal pain (10%), cough (7%), nasal congestion (4%)

<1%, postmarketing, and/or case reports: Abdominal pain, agitation, appetite decreased, arthralgia, bleeding (postprocedural), dizziness, fatigue, fever, flatulence, gastritis, gastrointestinal bleeding, GGT increased, hyperreflexia, irritability, MI, over stimulation, peripheral edema, polyuria, rash, respiratory failure, seizure, seizure exacerbation, thrombocytopenia, tremor, upper respiratory tract infection

Drug Interactions

Levodopa: Sapropterin may enhance the adverse/toxic effect of Levodopa. *Risk C: Monitor therapy*

Methotrexate: May decrease the serum concentration of Sapropterin. Specifically, methotrexate may decrease tissue concentrations of tetrahydrobiopterin. *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: Sapropterin may enhance the hypotensive effect of Phosphodiesterase 5 Inhibitors. *Risk C: Monitor therapy*

Monitoring ParametersBlood phenylalanine levels (baseline, after 1 week of treatment, periodically for first month, regularly thereafter); children may require more frequent monitoring

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking. Assess results of laboratory tests at baseline and periodically thereafter. Teach patient or caregiver proper use (requirements for phenylalanine-restricted diet), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsBlood phenylalanine levels (baseline, after 1 week of treatment, periodically for first month, regularly thereafter); children may require more frequent monitoring

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take at same time each day with food. Follow prescribed diet closely. You may experience headache; diarrhea, nausea, or vomiting; or nasal congestion or cough (consult prescriber if persistent or severe). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as dihydrochloride:

Kuvan™: 100 mg

Generic AvailableNo

ManufacturerBioMarin Pharmaceutical, Inc

Mechanism of ActionSapropterin is a synthetic form of the cofactor BH4 (tetrahydrobiopterin) for the enzyme phenylalanine hydroxylase (PAH). PAH hydroxylates phenylalanine to form tyrosine. BH4 activates residual PAH enzyme, improving normal phenylalanine metabolism and decreasing phenylalanine levels in sapropterin responders.

Pharmacodynamics/Kinetics

Onset of action: Within 24 hours; maximum effect: 1-2 months

Duration: 24 hours

Absorption: Absorption is enhanced when administered with food (high fat/high calorie)

Half-life elimination: ~7 hours (range: 4-17 hours)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusHeadaches are common; rare reports of agitation, dizziness, fatigue, and irritability

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concomitant use with lithium, SSRIs, valproic acid, and carbamazepine may produce additive effects. May cause neutropenia; use caution with clozapine and carbamazepine. Concomitant use with levodopa may increase the risk for seizures, over stimulation, and irritability.

Index Terms6R-BH4; Phenoptin; Sapropterin Dihydrochloride

Saquinavir

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Saquinavir may be confused with Sinequan®

Pronunciation(sa KWIN a veer)

U.S. Brand NamesInvirase®

Canadian Brand NamesInvirase®

Pharmacologic CategoryAntiretroviral Agent, Protease Inhibitor

Use: Labeled IndicationsTreatment of HIV infection; used in combination with at least two other antiretroviral agents

Dosing: Adults**HIV infection:** Oral: Invirase®: 1000 mg (five 200 mg capsules or two 500 mg tablets) twice daily given in combination with ritonavir 100 mg twice daily. This combination should be given together and within 2 hours after a full meal in combination with a nucleoside analog. **Note:** Saquinavir (Invirase®) should not be used in "unboosted regimens."

Dosage adjustments when administered in combination therapy: Lopinavir and ritonavir (Kaletra™): Invirase® 1000 mg twice daily

Dosing: ElderlyClinical studies did not include sufficient numbers of patients ≥65 years of age. Use caution due to increased frequency of organ dysfunction.

Dosing: Pediatric

HIV infection: Oral: Children >16 years: Refer to adult dosing.

Administration: OralTake saquinavir within 2 hours after a full meal. When used with ritonavir, saquinavir and ritonavir should be administered at the same time.

Dietary ConsiderationsAdminister within 2 hours of a meal. Invirase® capsules contain lactose 63.3 mg/capsule (not expected to induce symptoms of intolerance).

StorageInvirase®: Store at room temperature.

ContraindicationsHypersensitivity to saquinavir or any component of the formulation; severe hepatic impairment; coadministration with amiodarone, cisapride, flecainide, midazolam, pimozide, propafenone, quinidine, rifampin, triazolam, or ergot derivatives

Warnings/Precautions

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Increased cholesterol: Increases in total cholesterol and triglycerides have been reported; screening should be done prior to therapy and periodically throughout treatment.

Disease-related concerns:

- Diabetes: Changes in glucose tolerance, hyperglycemia, exacerbation of diabetes, DKA, and new-onset diabetes mellitus have been reported in patients receiving protease inhibitors.
- Hemophilia A or B: Use with caution in patients with hemophilia A or B; increased bleeding during protease inhibitor therapy has been reported.
- Hepatic impairment: May cause hepatitis and/or exacerbate pre-existing hepatic dysfunction; use with caution in patients with underlying hepatic disease, such as hepatitis B or C or cirrhosis.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.
- Invirase®: May be used only if combined with ritonavir.
- Not recommended: St. John's Wort, lovastatin, and simvastatin should not be used concurrently with saquinavir/ritonavir. A listing of medications that should not be used is available with each bottle and patients should be provided with this information.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children ≤16 years of age.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events were not observed in animal studies and saquinavir crosses the human placenta in minimal amounts. Based on limited data, Invirase® 1000 mg (capsules and tablets) administered twice daily with ritonavir 100 mg twice daily provide adequate levels in pregnant women. The Perinatal HIV Guidelines Working Group considers Invirase® capsules and ritonavir to be an alternative combination for use during pregnancy. Pregnancy and protease inhibitors are both associated with an increased risk of hyperglycemia. Glucose levels should be closely monitored. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease postnatal transmission of HIV.

Adverse Reactions

Incidence data shown for saquinavir soft gel capsule formulation (no longer available) in combination with ritonavir.

10%: Gastrointestinal: Nausea (11%)

1% to 10%:

Cardiovascular: Chest pain

Central nervous system: Fatigue (6%), fever (3%), anxiety, depression, headache, insomnia, pain

Dermatologic: Pruritus (3%), rash (3%), dry lips/skin (2%), eczema (2%), verruca

Endocrine & metabolic: Lipodystrophy (5%), hyperglycemia (3%), hypoglycemia, hyperkalemia, libido disorder, serum amylase increased

Gastrointestinal: Diarrhea (8%), vomiting (7%), abdominal pain (6%), constipation (2%), abdominal discomfort, appetite decreased, buccal mucosa ulceration, dyspepsia, flatulence, taste alteration

Hepatic: AST increased, ALT increased, bilirubin increased

Neuromuscular & skeletal: Back pain (2%), CPK increased, paresthesia, weakness

Renal: Creatinine kinase increased

Respiratory: Pneumonia (5%), bronchitis (3%), sinusitis (3%)

Miscellaneous: Influenza (3%)

Incidence not currently defined (limited to significant reactions; reported for hard or soft gel capsule with/without ritonavir)

Cardiovascular: Cyanosis, heart valve disorder (including murmur), hyper-/hypotension, peripheral vasoconstriction, syncope, thrombophlebitis

Central nervous system: Agitation, amnesia, ataxia, confusion, hallucination, hyper-/hyporeflexia, myelopolyradiculoneuritis, neuropathies, poliomyelitis, progressive multifocal encephalopathy, psychosis, seizures, somnolence, speech disorder, suicide attempt

Dermatologic: Alopecia, bullous eruption, dermatitis, erythema, maculopapular rash, photosensitivity, Stevens-Johnson syndrome, skin ulceration, urticaria

Endocrine & metabolic: Dehydration, diabetes, electrolyte changes, TSH increased

Gastrointestinal: Ascites, colic, dysphagia, esophagitis, bloody stools, gastritis, intestinal obstruction, hemorrhage (rectal), pancreatitis, stomatitis

Genitourinary: impotence, prostate enlarged, hematuria, UTI

Hematologic; Acute myeloblastic leukemia, anemia (including hemolytic), leukopenia, neutropenia, pancytopenia, splenomegaly, thrombocytopenia

Hepatic: Alkaline phosphatase increased, GGT increased, hepatitis, hepatomegaly, hepatosplenomegaly, jaundice, liver disease exacerbation

Neuromuscular & skeletal: Arthritis, LDH increased

Ocular: Blepharitis, visual disturbance

Otic: Otitis, hearing decreased, tinnitus

Renal: Nephrolithiasis, renal calculus

Respiratory: Dyspnea, hemoptysis, pharyngitis, upper respiratory tract infection

Miscellaneous: Infections (bacterial, fungal, viral)

Metabolism/Transport Effects**Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2C9 (weak), 2C19 (weak), 2D6 (weak), 3A4 (moderate)

Drug Interactions

Abacavir: Protease Inhibitors may decrease the serum concentration of Abacavir. *Risk C: Monitor therapy*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amiodarone: Protease Inhibitors may decrease the metabolism of Amiodarone. *Risk X: Avoid combination*

Antacids: May decrease the absorption of Protease Inhibitors. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). Management: Limit indinavir to 600mg every 8 hours with itraconazole or ketoconazole. When used with ritonavir, limit ketoconazole to 200mg/day. Tipranavir labeling recommends limiting fluconazole, itraconazole, and ketoconazole to 200mg with tipranavir/ritonavir. **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Protease Inhibitors may decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Dihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). Increased serum concentrations of the calcium channel blocker may increase risk of AV nodal blockade. *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Protease Inhibitors. Protease Inhibitors may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cisapride: Protease Inhibitors may decrease the metabolism of Cisapride. The resultant increase in serum cisapride concentrations may result in QTc prolongation and malignant cardiac arrhythmias. *Risk X: Avoid combination*

Clarithromycin: Protease Inhibitors may diminish the therapeutic effect of Clarithromycin. Specifically, certain protease inhibitors may decrease formation of the active 14-hydroxy-clarithromycin metabolite, which may negatively impact clarithromycin effectiveness vs. H. influenzae and other non-MAC infections. Protease Inhibitors may increase the serum concentration of Clarithromycin. Clarithromycin dose adjustment in renally impaired patients may be needed. Clarithromycin may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): Protease Inhibitors may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk D: Consider therapy modification*

CycloSPORINE: Protease Inhibitors may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Darunavir: Saquinavir may decrease the serum concentration of Darunavir. *Risk X: Avoid combination*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Delavirdine: Protease Inhibitors may decrease the serum concentration of Delavirdine. Delavirdine may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Digoxin: Protease Inhibitors may increase the serum concentration of Digoxin. Increased serum concentrations of digoxin may increase risk of AV nodal blockade. *Risk C: Monitor therapy*

Efavirenz: May increase the metabolism of Protease Inhibitors. This specifically includes amprenavir, indinavir, and saquinavir. Efavirenz may increase the serum concentration of Protease Inhibitors. This specifically includes nelfinavir and ritonavir. *Risk D: Consider therapy modification*

Enfuvirtide: Protease Inhibitors may increase the serum concentration of Enfuvirtide. Enfuvirtide may increase the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

Eplerenone: Protease Inhibitors may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: Protease Inhibitors may decrease the metabolism of Ergot Derivatives. **Exceptions:** Cabergoline. *Risk X: Avoid combination*

Etravirine: Protease Inhibitors may decrease the serum concentration of Etravirine. This effect is anticipated with darunavir & saquinavir (with low-dose ritonavir). Etravirine may increase the serum concentration of Protease Inhibitors. This effect is anticipated with nelfinavir. Protease Inhibitors may increase the serum concentration of Etravirine. This is expected with lopinavir/ritonavir. Management: Low-dose ritonavir boosting MUST be used when these protease inhibitors are used with etravirine. *Risk C: Monitor therapy*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

FentaNYL: Protease Inhibitors may decrease the metabolism of FentaNYL. *Risk C: Monitor therapy*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fusidic Acid: Protease Inhibitors may decrease the metabolism of Fusidic Acid. Fusidic Acid may decrease the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Garlic: May decrease the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

H2-Antagonists: May increase the serum concentration of Saquinavir. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Protease Inhibitors may increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. **Exceptions:** Fluvastatin. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Meperidine: Protease Inhibitors may enhance the adverse/toxic effect of Meperidine. Protease Inhibitors may decrease the serum concentration of Meperidine. Concentrations of the toxic Normeperidine metabolite may be increased. *Risk D: Consider therapy modification*

Methadone: Protease Inhibitors may decrease the metabolism of Methadone. *Risk C: Monitor therapy*

Nefazodone: Protease Inhibitors may decrease the metabolism of Nefazodone. *Risk C: Monitor therapy*

Nevirapine: May increase the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): May diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: Protease Inhibitors may decrease the metabolism of Phosphodiesterase 5 Inhibitors. Management: Dose restrictions for tadalafil, and/or sildenafil and vardenafil are recommended in combination with ritonavir, atazanavir, indinavir, darunavir and saquinavir. Consult specific prescribing information for detailed recommendations. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Protease Inhibitors may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Protease Inhibitors: May increase the serum concentration of other Protease Inhibitors. Management: Atazanavir--indinavir combination contraindicated. Amprenavir oral solution not recommended with ritonavir oral solution; tipranavir/ritonavir or atazanavir/ritonavir not recommended with other protease inhibitors. Other combos may require dose changes. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May increase the serum concentration of Saquinavir. *Risk C: Monitor therapy*

QuiNIDine: Protease Inhibitors may decrease the metabolism of QuiNIDine. *Risk X: Avoid combination*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: Protease Inhibitors may decrease the metabolism of Rifamycin Derivatives. Specifically rifabutin. Rifamycin Derivatives may decrease the serum concentration of Protease Inhibitors. Rifampin administration should be avoided. Dosage adjustments with both rifabutin and the protease inhibitors are necessary if used together. Management: Avoid using rifampin with protease inhibitors. Rifabutin and protease inhibitor dose adjustments will likely be required when using rifabutin together with protease inhibitors; consult specific protease inhibitor(s) prescribing information. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sirolimus: Protease Inhibitors may increase the serum concentration of Sirolimus. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Protease Inhibitors. *Risk X: Avoid combination*

Tacrolimus: Protease Inhibitors may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Temsirolimus: Protease Inhibitors may enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Theophylline Derivatives: Protease Inhibitors may decrease the serum concentration of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

TraZODone: Protease Inhibitors may increase the serum concentration of TraZODone. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Protease Inhibitors may increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Valproic Acid: Protease Inhibitors may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Zidovudine: Protease Inhibitors may decrease the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: A high-fat meal maximizes bioavailability. Saquinavir levels may increase if taken with grapefruit juice.

Herb/Nutraceutical: Saquinavir serum concentrations may be decreased by St John's wort; avoid concurrent use. Garlic capsules may decrease saquinavir serum concentrations; avoid use if saquinavir is the only protease inhibitor.

Monitoring ParametersMonitor viral load, CD4 count, triglycerides, cholesterol, glucose

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions or toxicity (multiple liver enzyme interactions may increase or decrease levels/effects of drugs and increase potential for severe toxicity or loss of effectiveness); dosing adjustments may be necessary. A list of medications that should not be used is available in each bottle and patients should be provided with this information. Assess therapeutic response (CD4 count, hepatic function) and adverse reactions (gastrointestinal disturbance, nausea, vomiting, diarrhea that can lead to dehydration and weight loss; hyperlipidemia and redistribution of body fat; rash; CNS effects, malaise, insomnia, abnormal thinking, electrolyte imbalance) at regular intervals during therapy. Caution patients to monitor glucose levels closely; protease inhibitors may cause hyperglycemia or new-onset diabetes. Teach patient proper use (eg, timing of multiple medications and drugs that should not be used concurrently), possible side effects/appropriate interventions (eg, use of barrier contraceptives; protease inhibitors may decrease effectiveness of oral contraceptives), and adverse symptoms to report.

Monitoring: Lab TestsCBC, renal and liver function, electrolytes, triglycerides, cholesterol, glucose, CD4 cell count, plasma levels of HIV RNA

Patient EducationYou will be provided with a list of specific medications that should not be used during therapy; do not take any new prescriptions, over-the-counter medications, or herbal products (even if they are not on the list) without consulting prescriber. This is not a cure for HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. Take exactly as directed. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you miss a dose, take as soon as possible and return to your regular schedule (never take a double dose). Frequent blood tests may be required with prolonged therapy. You may be advised to check your glucose levels (this drug can cause exacerbation or new-onset diabetes). May cause body changes due to redistribution of body fat, facial atrophy, or breast enlargement (normal effects of drug). May cause dizziness, insomnia, abnormal thinking (use caution when driving or engaging in potentially hazardous tasks until response to drug is known); nausea, vomiting, or taste perversion (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); muscle weakness (consult prescriber for approved analgesic); or headache or insomnia (consult prescriber for medication). Inform prescriber if you experience muscle numbness or tingling; unresolved persistent vomiting, diarrhea, or abdominal pain; respiratory difficulty or chest pain; unusual skin rash; change in color of stool or urine; or any persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Effectiveness of oral contraceptives may be decreased, use of alternative (nonhormonal) forms of contraception is recommended; consult prescriber for appropriate contraceptives. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Invirase®: 200 mg [contains lactose 63.3 mg/capsule]

Tablet:

Invirase®: 500 mg

Generic AvailableNo

ManufacturerRoche Laboratories Inc

Pricing: U.S. (www.drugstore.com)

Capsules (Fortovase)

200 mg (180): $229.12

Capsules (Invirase)

200 mg (270): $797.93

Tablets (Invirase)

500 mg (120): $890.75

Mechanism of ActionAs an inhibitor of HIV protease, saquinavir prevents the cleavage of viral polyprotein precursors which are needed to generate functional viral proteins required for the maturation of an infectious HIV virion.

Pharmacodynamics/Kinetics

Absorption: Poor; increased with high fat meal; Fortovase® has improved absorption over Invirase®

Distribution: V_d: 700 L; does not distribute into CSF

Protein binding, plasma: ~98%

Metabolism: Extensively hepatic via CYP3A4; extensive first-pass effect

Bioavailability: Invirase®: ~4%

Excretion: Feces (81% to 88%), urine (1% to 3%) within 5 days

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Buccal mucosa ulceration and taste alteration.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay rarely cause confusion or ataxia; report of acute paranoia reaction to saquinavir
Mental Health: Effects on Psychiatric TreatmentContraindicated with triazolam and midazolam; barbiturates and carbamazepine may increase the metabolism of saquinavir. Concomitant use of saquinavir and St John's wort is not recommended. Coadministration of protease inhibitors (saquinavir) with St John's wort is expected to substantially decrease protease inhibitor serum concentrations leading to a loss of virologic response and possible resistance to saquinavir or to the class of protease inhibitors.
Anesthesia and Critical Care Concerns/Other ConsiderationsPotential compliance problems, frequency of administration, and adverse effects should be discussed with patients before initiating therapy to help prevent the emergence of resistance.
Index TermsSaquinavir Mesylate

Special Alerts

Sargramostim: Liquid Reformulated - June 2008

Bayer Healthcare has reformulated liquid sargramostim (Leukine®). The new formulation, which does not contain edetate disodium (EDTA), is now available.

Medication Safety Issues

Sound-alike/look-alike issues:

Leukine® may be confused with Leukeran®, leucovorin

Pronunciation(sar GRAM oh stim)

U.S. Brand NamesLeukine®

Canadian Brand NamesLeukine®

Pharmacologic CategoryColony Stimulating Factor

Use: Labeled Indications

Acute myelogenous leukemia (AML) following induction chemotherapy in older adults (≥55 years of age) to shorten time to neutrophil recovery and to reduce the incidence of severe and life-threatening infections and infections resulting in death

Bone marrow transplant (allogeneic or autologous) failure or engraftment delay

Myeloid reconstitution after allogeneic bone marrow transplantation

Myeloid reconstitution after autologous bone marrow transplantation: Non-Hodgkin's lymphoma (NHL), acute lymphoblastic leukemia (ALL), Hodgkin's lymphoma

Peripheral stem cell transplantation: Mobilization and myeloid reconstitution following autologous peripheral stem cell transplantation

Dosing: Adults

I.V. infusion over ≥2 hours or SubQ: **Rounding the dose to the nearest vial size enhances patient convenience and reduces costs without clinical detrement.**

Myeloid reconstitution after allogeneic or autologous bone marrow transplant: I.V.: 250 mcg/m^2/day (over 2 hours), begin 2-4 hours after the marrow infusion and ≥24 hours after chemotherapy or radiotherapy, when the post marrow infusion ANC is <500 cells/mm^3, and continue until ANC >1500 cells/mm^3 for 3 consecutive days

If a severe adverse reaction occurs, reduce the dose by 50% or temporarily discontinue until the reaction abates

If blast cells appear or progression of the underlying disease occurs, discontinue treatment

If ANC >20,000 cells/mm^3, interrupt treatment or reduce the dose by 50%

Neutrophil recovery following chemotherapy in AML: I.V.: 250 mcg/m^2/day (over 4 hours) starting approximately on day 11 or 4 days following the completion of induction chemotherapy, if day 10 bone marrow is hypoplastic with <5% blasts

If a second cycle of chemotherapy is necessary, administer ~4 days after the completion of chemotherapy if the bone marrow is hypoplastic with <5% blasts

Continue sargramostim until ANC is >1500 cells/mm^3 for 3 consecutive days or a maximum of 42 days

Discontinue sargramostim immediately if leukemic regrowth occurs

If a severe adverse reaction occurs, reduce the dose by 50% or temporarily discontinue the dose until the reaction abates

If ANC >20,000 cells/mm^3, interrupt treatment or reduce the dose by 50%

Mobilization of peripheral blood progenitor cells: I.V., SubQ: 250 mcg/m^2/day I.V. over 24 hours or SubQ once daily

Continue the same dose through the period of PBPC collection

The optimal schedule for PBPC collection has not been established (usually begun by day 5 and performed daily until protocol specified targets are achieved)

If WBC >50,000 cells/mm^3, reduce the dose by 50%

If adequate numbers of progenitor cells are not collected, consider other mobilization therapy

Postperipheral blood progenitor cell transplantation: I.V., SubQ: 250 mcg/m^2/day I.V. over 24 hours or SubQ once daily beginning immediately following infusion of progenitor cells and continuing until ANC is >1500 cells/mm^3 for 3 consecutive days is attained

BMT failure or engraftment delay: I.V.: 250 mcg/m^2/day over 2 hours for 14 days

May be repeated after 7 days off therapy if engraftment has not occurred

If engraftment still has not occurred, a third course of 500 mcg/m^2/day for 14 days may be tried after another 7 days off therapy; if there is still no improvement, it is unlikely that further dose escalation will be beneficial

If a severe adverse reaction occurs, reduce the dose by 50% or temporarily discontinue the dose until the reaction abates

If blast cells appear or disease progression occurs, discontinue treatment

If ANC >20,000 cells/mm^3, interrupt treatment or reduce the dose by 50%

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDosage not established in children (unlabeled use). Refer to adult dosing.

Dosing: Combination Regimens

Lymphoma, non-Hodgkin's: CODOX-M

Calculations

- ANC: Absolute Neutrophil Count
- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Can premedicate with analgesics and antipyretics (eg, acetaminophen) to control adverse events (eg, fever, chills, myalgia, etc); control bone pain with non-narcotic analgesics I.V. infusion should be over 2-24 hours; incompatible with dextrose-containing solutions. An in-line membrane filter should **NOT** be used for intravenous administration.

Administration: I.V. DetailpH: 7.1-7.7

Administration: OtherAdminister by SubQ (undiluted). Do not shake solution. When administering GM-CSF subcutaneously, rotate injection sites.

Storage Store at 2°C to 8°C (36°F to 46°F); do not freeze. Do not shake.

Solution for injection: May be stored for up to 20 days at 2°C to 8°C (36°F to 46°F) once the vial has been entered. Discard remaining solution after 20 days.

Powder for injection: Preparations made with SWFI should be administered as soon as possible, and discarded within 6 hours of reconstitution. Preparations made with bacteriostatic water may be stored for up to 20 days at 2°C to 8°C (36°F to 46°F).

I.V. infusion administration: Preparations diluted with NS are stable for 48 hours at room temperature and refrigeration.

Reconstitution

Powder for injection: May be reconstituted with preservative free SWFI or bacteriostatic water for injection (with benzyl alcohol 0.9%). Gently swirl to reconstitute; do not shake.

Sargramostim may also be further diluted in 25-50 mL NS to a concentration ≥10 mcg/mL for I.V. infusion administration.

If the final concentration of sargramostim is <10 mcg/mL, 1 mg of human albumin/1 mL of NS (eg, 1 mL of 5% human albumin/50 mL of NS) should be added.

CompatibilityStable in NS, sterile water for injection, bacteriostatic water; **incompatible** with dextrose-containing solutions.

Y-site administration: Compatible: Amikacin, aminophylline, aztreonam, bleomycin, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, cisplatin, clindamycin, co-trimoxazole, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, dexamethasone sodium phosphate, diphenhydramine, dopamine, doxorubicin, doxycycline, droperidol, etoposide, famotidine, fentanyl, floxuridine, fluconazole, fluorouracil, furosemide, gentamicin, granisetron, heparin, idarubicin, ifosfamide, immune globulin, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna, methotrexate, metoclopramide, metronidazole, minocycline, mitoxantrone, netilmicin, pentostatin, piperacillin/tazobactam, potassium chloride, prochlorperazine edisylate, promethazine, ranitidine, teniposide, ticarcillin, ticarcillin/clavulanate, vinblastine, vincristine, zidovudine. **Incompatible:** Acyclovir, ampicillin, ampicillin/sulbactam, cefoperazone, chlorpromazine, ganciclovir, haloperidol, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, imipenem/cilastatin, lorazepam, methylprednisolone sodium succinate, mitomycin, morphine, nalbuphine, ondansetron, piperacillin, sodium bicarbonate, tobramycin. **Variable (consult detailed reference):** Amphotericin B, amsacrine, ceftazidime, vancomycin.

ContraindicationsHypersensitivity to sargramostim, yeast-derived products, or any component of the formulation; concurrent (24 hours preceding/following) myelosuppressive chemotherapy or radiation therapy; patients with excessive (≥10%) leukemic myeloid blasts in bone marrow or peripheral blood

Warnings/Precautions

Concerns related to adverse effects:

- Allergic reactions: Anaphylaxis or other serious allergic reactions have been reported; discontinue immediately if occur.

Disease-related concerns:

- Cardiac disease: Use with caution in patients with pre-existing cardiac problems or HF. Transient supraventricular arrhythmias have been reported in patients with history of arrhythmias.

- Fluid retention: Edema, capillary leak syndrome, pleural and/or pericardial effusion have been reported. Use with caution in patients with pre-existing fluid retention; may worsen.

- Hepatic impairment: Use with caution in patients with hepatic impairment; monitor hepatic function in patients with history of hepatic dysfunction. Bilirubin and transaminase elevations have been observed with use.

- Renal impairment: Use with caution in patients with renal impairment; monitor renal function in patients with history of renal dysfunction. Serum creatinine elevations have been observed with use.

- Respiratory problems: Dyspnea may occur; monitor respiratory symptoms during and following infusion. Decrease infusion rate by 50% if dyspnea occurs; discontinue with persistent dyspnea. Use with caution in patients with hypoxia, pulmonary infiltrates, or pre-existing lung disease.

Concurrent drug therapy issues:

- Cytotoxic chemotherapy/radiotherapy: Simultaneous administration, or administration 24 hours preceding/following cytotoxic chemotherapy or radiotherapy is not recommended.

Other warnings/precautions:

- Benzyl alcohol: Solution contains benzyl alcohol which has been associated with "gasping syndrome" in neonates.

- Blood counts: If there is a rapid increase in blood counts (ANC >20,000/mm^3, WBC >50,000/mm^3, or platelets >500,000/mm^3), decrease dose by 50% or discontinue drug (counts will fall to normal within 3-7 days after discontinuing drug).

- First dose effect: There is a “first-dose effect” (refer to Adverse Reactions for details) which is seen (rarely) with the first dose of a cycle and does not usually occur with subsequent doses within that cycle.

- Tumor growth factor: May potentially act as a growth factor for any tumor type, particularly myeloid malignancies; caution should be exercised when using in any malignancy with myeloid characteristics. Tumors of nonhematopoietic origin may have surface receptors for sargramostim. Discontinue use if disease progression occurs during treatment.

Pregnancy Risk FactorC

Pregnancy ConsiderationsClinical effects to the fetus: Animal reproduction studies have not been conducted. It is not known whether sargramostim can cause fetal harm when administered to a pregnant woman or can affect reproductive capability. Sargramostim should be given to a pregnant woman only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Cardiovascular: Hypertension (34%), pericardial effusion (4% to 25%), edema (13% to 25%), chest pain (15%), peripheral edema (11%), tachycardia (11%)

Central nervous system: Fever (81%), malaise (57%), headache (26%), chills (25%), anxiety (11%), insomnia (11%)

Dermatologic: Rash (44%), pruritus (23%)

Endocrine & metabolic: Hyperglycemia (25%), hypercholesterolemia (17%), hypomagnesemia (15%)

Gastrointestinal: Diarrhea (≤89%), nausea (58% to 70%), vomiting (46% to 70%), abdominal pain (38%), weight loss (37%), anorexia (13%), hematemesis (13%), dysphagia (11%), gastrointestinal hemorrhage (11%)

Genitourinary: Urinary tract disorder (14%)

Hepatic: Hyperbilirubinemia (30%)

Neuromuscular & skeletal: Weakness (66%), bone pain (21%), arthralgia (11% to 21%) myalgia (18%)

Ocular: Eye hemorrhage (11%)

Renal: BUN increased (23%), serum creatinine increased (15%)

Respiratory: Pharyngitis (23%), epistaxis (17%), dyspnea (15%)

Miscellaneous: Antibody formation (2%)

1% to 10%: Respiratory: Pleural effusion (1%)

<1%, postmarketing, and/or case reports: Allergic reaction, anaphylaxis, arrhythmia, capillary leak syndrome, constipation, dizziness, eosinophilia; first-dose effect (syndrome with respiratory distress, hypoxia, flushing, hypotension, syncope, and/or tachycardia occurring with the first dose of a treatment cycle); injection site reaction, lethargy, leukocytosis, liver function abnormalities (transient), pain, pericarditis, prothrombin time prolonged, rigors, sore throat, supraventricular arrhythmia (transient), thrombocytosis, thrombophlebitis, thrombosis

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug InteractionsThere are no known significant interactions.

Test InteractionsMay interfere with bone imaging studies; increased hematopoietic activity of the bone marrow may appear as transient positive bone imaging changes

Monitoring ParametersVital signs, hydration status, weight, CBC with differential twice weekly during therapy, renal/liver function tests at least biweekly during therapy (in patients displaying renal or hepatic dysfunction prior to initiation of treatment), pulmonary function

Reference RangeExcessive leukocytosis: ANC >20,000/mm^3 or WBC >50,000 cells/mm^3

Nursing: Physical Assessment/MonitoringUse with caution in presence of pre-existing cardiac problems or hepatic, renal, or pulmonary impairment. See Administration, Reconstitution, and Compatibility for specific infusion directions. Patient must be monitored closely during and following infusion for respiratory symptoms and "first-dose effect" (hypotension, tachycardia, flushing, and syncope with the first dose of a cycle). Assess results of laboratory tests closely. Premedication may be used to control adverse events. Evaluate therapeutic response and adverse reactions frequently throughout therapy (eg, respiratory symptoms, fluid balance [I and O], rash, hypotension, tachycardia, GI disturbance [diarrhea, stomatitis, mucositis], myalgia, bone pain). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential twice weekly during therapy, renal/liver function tests at least biweekly during therapy (in patients displaying renal or hepatic dysfunction prior to initiation of treatment)

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. This medication can only be administered by infusion or injection. Report immediately any redness, swelling, pain, or burning at infusion/injection site; difficulty breathing; or chest pain. You will require frequent blood tests during treatment. You may experience bone, joint, or muscle pain (consult prescriber for analgesic); nausea, vomiting, or loss of appetite (small, frequent meals, chewing gum, or sucking lozenges may help); hair loss (reversible); diarrhea (buttermilk, boiled milk, or yogurt may help); or headache, dizziness, or insomnia (use caution when driving or engaging in potentially hazardous tasks until response to drug is known). At any time during treatment, report chest pain or palpitations, signs or symptoms of edema (eg, swollen extremities, difficulty breathing, rapid weight gain), onset of severe headache, acute back or chest pain, muscular tremors or seizure activity, or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Leukine®: 250 mcg [contains sucrose 10 mg/mL]

Injection, solution:

Leukine®: 500 mcg/mL (1 mL) [contains benzyl alcohol and sucrose 10 mg/mL]

Generic AvailableNo

ManufacturerBayer

Mechanism of ActionStimulates proliferation, differentiation and functional activity of neutrophils, eosinophils, monocytes, and macrophages, as indicated.

Pharmacodynamics/Kinetics

Onset of action: Increase in WBC: 7-14 days

Duration: WBCs return to baseline within 1 week of discontinuing drug

Half-life elimination: I.V.: 60 minutes; SubQ: 2.7 hours

Time to peak, serum: SubQ: 1-3 hours

Medication Safety Issues
Transdermal patch may contain conducting metal (eg, aluminum); remove patch prior to MRI.

Pronunciation(skoe POL a meen dah RIV ah tives)
U.S. Brand NamesIsopto® Hyoscine; Scopace™; Transderm Scōp®
Canadian Brand NamesBuscopan®; Transderm-V®
Pharmacologic CategoryAnticholinergic Agent
Use: Labeled Indications

Scopolamine base:

Transdermal: Prevention of nausea/vomiting associated with motion sickness and recovery from anesthesia and surgery

Scopolamine hydrobromide:

Injection: Preoperative medication to produce amnesia, sedation, tranquilization, antiemetic effects, and decrease salivary and respiratory secretions

Ophthalmic: Produce cycloplegia and mydriasis; treatment of iridocyclitis

Oral: Symptomatic treatment of postencephalitic parkinsonism and paralysis agitans; in spastic states; inhibits excessive motility and hypertonus of the gastrointestinal tract in such conditions as the irritable colon syndrome, mild dysentery, diverticulitis, pylorospasm, and cardiospasm

Scopolamine butylbromide [not available in the U.S.]:

Oral/injection: Treatment of smooth muscle spasm of the genitourinary or gastrointestinal tract; injection may also be used to prior to radiological/diagnostic procedures to prevent spasm

Dosing: Adults**Note:** Scopolamine (hyoscine) hydrobromide should not be interchanged with scopolamine butylbromide formulations. Dosages are not equivalent.
Scopolamine base:

Preoperative: Transdermal patch: Apply 1 patch to hairless area behind ear the night before surgery or 1 hour prior to cesarean section (apply no sooner than 1 hour before surgery to minimize newborn exposure); remove 24 hours after surgery

Motion sickness: Transdermal patch: Apply 1 patch behind the ear at least 4 hours prior to exposure and every 3 days as needed; effective if applied as soon as 2-3 hours before anticipated need, best if 12 hours before

Scopolamine hydrobromide:

Antiemetic: SubQ: 0.6-1 mg

Preoperative: I.M., I.V., SubQ: 0.3-0.65 mg

Sedation, tranquilization: I.M., I.V., SubQ: 0.6 mg 3-4 times/day

Refraction: Ophthalmic: Instill 1-2 drops of 0.25% to eye(s) 1 hour before procedure

Iridocyclitis: Ophthalmic: Instill 1-2 drops of 0.25% to eye(s) up to 4 times/day

Parkinsonism, spasticity, motion sickness: Oral: 0.4-0.8 mg. May repeat every 8-12 hours as needed; the dosage may be cautiously increased in parkinsonism and spastic states. For motion sickness, administration at least 1 hour before exposure is recommended.

Scopolamine butylbromide:

Gastrointestinal/genitourinary spasm (Buscopan® [CAN]; not available in the U.S.):

Oral: 10-20 mg daily (1-2 tablets); maximum: 6 tablets/day

I.M., I.V., SubQ: 10-20 mg; maximum: 100 mg/day. Intramuscular injections should be administered 10-15 minutes prior to radiological/diagnostic procedures

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Scopolamine hydrobromide:**

Antiemetic: SubQ: 0.006 mg/kg

Preoperative: I.M., I.V., SubQ:

Children 6 months to 3 years: 0.1-0.15 mg

Children 3-6 years: 0.2-0.3 mg

Refraction: Ophthalmic: Instill 1 drop of 0.25% to eye(s) twice daily for 2 days before procedure

Iridocyclitis: Ophthalmic: Instill 1 drop of 0.25% to eye(s) up to 3 times/day

Administration: I.V.

Hydrobromide: Inject over 2-3 minutes

Butylbromide: Inject at a rate of 1 mL/minute

Administration: I.V. Detail

Hydrobromide: Dilute with an equal volume of sterile water and administer by direct I.V.

pH: 3.5-6.5

Butylbromide: No dilution is necessary prior to injection

Administration: Topical

Ophthalmic: Remove contact lenses prior to administration; wait 15 minutes before reinserting if using products containing benzalkonium chloride. Wash hands following administration.

Transdermal: Topical patch is programmed to deliver 1 mg over 3 days. Once applied, do not remove the patch for 3 full days. Apply to hairless area of skin behind the ear. Wash hands before and after applying the disc to avoid drug contact with eyes.

Storage

Injection: Store at room temperature of 15°C to 30°C (58°F to 86°F). Protect from light.

Hydrobromide injection: Avoid acid solutions, hydrolysis occurs at pH <3.

Butylbromide injection: Stable in D_5W, NS, $D_{10}W$, and LR for up to 8 hours.

Ophthalmic solution: Store at 8°C to 27°C (46°F to 80°F). Protect from light.

Tablet: Store at room temperature of 15°C to 30°C (58°F to 86°F).

Transdermal system: Store at 20°C to 25°C (68°F to 77°F).

Compatibility

Y-site administration: Hydrobromide: Compatible: Heparin, hydrocortisone sodium succinate, potassium chloride, propofol, sufentanil, vitamin B complex with C.

Compatibility in syringe:

Hydrobromide: Compatible: Atropine, butorphanol, chlorpromazine, cimetidine, diamorphine, dimenhydrinate, diphenhydramine, droperidol, fentanyl, glycopyrrolate, hydromorphone, hydroxyzine, meperidine, metoclopramide, midazolam, morphine, nalbuphine, pentazocine, pentobarbital, perphenazine, prochlorperazine edisylate, promazine, promethazine, ranitidine, sufentanil, thiopental.

Butylbromide: Compatible: Dimenhydrinate, fentanyl, midazolam, morphine.

Compatibility when admixed: Hydrobromide: Compatible: Floxacillin, furosemide, meperidine, succinylcholine.

ContraindicationsHypersensitivity to scopolamine, other belladonna alkaloids, or any component of the formulation; narrow-angle glaucoma; acute hemorrhage; paralytic ileus; tachycardia secondary to cardiac insufficiency; myasthenia gravis

Tablet formulations are contraindicated in patients with prostatic hyperplasia, pyloric obstruction, or patients with an idiosyncrasy to anticholinergic drugs.

Injectable formulations are contraindicated in patients with chronic lung disease (repeated administration).

Allergy Considerations

- Belladonna Alkaloid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May cause drowsiness and/or blurred vision, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Idiosyncratic reaction: Patients with idiosyncratic reaction to anticholinergics, including scopolamine, may experience disorientation, delirium and/or marked somnolence; may be accompanied by dilated pupils, rapid pulse and xerostomia.

- Visual disturbances: Discontinue if patient reports unusual visual disturbances or pain within the eye.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with coronary artery disease, tachyarrhythmias, heart failure, or hypertension; evaluate tachycardia prior to administration.

- Gastrointestinal obstruction: Use with caution in patients with GI obstruction.

- Hepatic impairment: Use with caution in patients with hepatic impairment; adverse CNS effects occur more often in these patients.

- Hiatal hernia: Use with caution in patients with hiatal hernia with reflux esophagitis.

- Prostatic hyperplasia/urinary retention: Use injectable, ophthalmic, and transdermal products with caution in patients with prostatic hyperplasia (nonobstructive) or urinary retention; oral products are contraindicated.

- Psychosis: Use with caution in patients with a history of psychosis; may exacerbate condition.

- Renal impairment: Use with caution in patients with renal impairment; adverse CNS effects occur more often in these patients.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; may exacerbate condition.

- Ulcerative colitis: Use with caution in patients with ulcerative colitis; may precipitate/aggravate toxic megacolon.

Special populations:

- Pediatrics: Use with caution in infants and children since they may be more susceptible to adverse effects; safety and efficacy have not been established for the use of transdermal and oral scopolamine in children.

Dosage form specific issues:

- Ophthalmic products: May contain benzalkonium chloride which may be absorbed by contact lenses; remove contacts prior to administration and wait 15 minutes before reinserting.

- Product interchangeability: Scopolamine (hyoscine) hydrobromide should not be interchanged with scopolamine butylbromide formulations; dosages are not equivalent.

- Transdermal patch: May contain conducting metal (eg, aluminum); remove patch prior to MRI.

Geriatric ConsiderationsBecause of its long duration of action as a mydriatic agent, it should be avoided in elderly patients. Anticholinergic agents are not well tolerated in the elderly and their use should be avoided when possible.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies; embryotoxic events were observed in some studies. Scopolamine crosses the placenta; may cause respiratory depression and/or neonatal hemorrhage when used during pregnancy. Transdermal scopolamine has been used as an adjunct to epidural anesthesia for cesarean delivery without adverse CNS effects on the newborn. Except when used prior to cesarean section, use during pregnancy only if the benefit to the mother outweighs the potential risk to the fetus.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Adverse ReactionsFrequency not defined.

Ophthalmic:Note: Systemic adverse effects have been reported following ophthalmic administration.

Central nervous system: Drowsiness, somnolence, visual hallucination

Dermatologic: Eczematoid dermatitis

Ocular: Blurred vision, edema, exudate, follicular conjunctivitis, increased intraocular pressure, local irritation, photophobia, vascular congestion

Respiratory: Congestion

Systemic:

Cardiovascular: Flushing, orthostatic hypotension, palpitation, tachycardia, ventricular fibrillation

Central nervous system: Acute toxic psychosis (rare), agitation (rare), ataxia, confusion, delusion (rare), disorientation, dizziness, drowsiness, fatigue, hallucination (rare), headache, loss of memory, paranoid behavior (rare), restlessness

Dermatologic: Dry skin, erythema, increased sensitivity to light, rash

Endocrine & metabolic: Decreased flow of breast milk, thirst

Gastrointestinal: Bloated feeling, constipation, dry throat, dysphagia, nausea, vomiting, xerostomia

Genitourinary: Dysuria, urinary retention

Local: Irritation at injection site

Neuromuscular & skeletal: Tremor, weakness

Ocular: Accommodation impaired, blurred vision, cycloplegia, dryness, glaucoma (narrow-angle), increased intraocular pain, itching, photophobia, pupil dilation

Respiratory: Dry nose

Miscellaneous: Diaphoresis (decreased), heat intolerance

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Test InteractionsInterferes with gastric secretion test

Monitoring ParametersBody temperature, heart rate, urinary output, intraocular pressure

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (eg, ergot-containing drugs). When used preoperatively, safety precautions should be observed and patient should be advised about blurred vision. For all uses, assess therapeutic effectiveness and adverse reactions. Teach patient appropriate use (according to formulation and purpose), interventions to reduce side effects, and adverse symptoms to report. Systemic effects have been reported following ophthalmic administration.

Patient EducationUse as directed. May cause drowsiness, confusion, impaired judgment, or vision changes (use caution when driving or engaging in tasks requiring alertness until response to drug is known); dry mouth, nausea, or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); orthostatic hypotension (use caution when climbing stairs and when rising from lying or sitting position); constipation (increased exercise, fluids, fruit, or fiber may help; if not effective consult prescriber); increased sensitivity to heat and decreased perspiration (avoid extremes of heat, reduce exercise in hot weather); or decreased milk if breast-feeding. Report hot, dry, flushed skin; blurred vision or vision changes; difficulty swallowing; chest pain, palpitations, or rapid heartbeat; painful or difficult urination; increased confusion, depression, or loss of memory; rapid or difficult respirations; muscle weakness or tremors; or eye pain. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Transdermal: Apply patch behind ear the day before traveling. Wash hands before and after applying, and avoid contact with the eyes. Do not remove for 3 days. Patch may contain metal; remove prior to MRI.

Ophthalmic: Instill as often as recommended. Wash hands before using. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Sit or lie down, open eye, look at ceiling, and instill prescribed amount of solution. Do not blink for 30 seconds, close eye and roll eye in all directions, and apply gentle pressure to inner corner of eye for 1-2 minutes. Temporary stinging or blurred vision may occur.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, solution, as hydrobromide: 0.4 mg/mL (1 mL)

Injection, solution, as hyoscine-N-butylbromide:

Buscopan® [CAN]: 20 mg/mL [not available in U.S.]

Solution, ophthalmic, as hydrobromide:

Isopto® Hyoscine: 0.25% (5 mL) [contains benzalkonium chloride]

Tablet, as hyoscine-N-butylbromide:

Buscopan® [CAN]: 10 mg [not available in U.S.]

Tablet, soluble, as hydrobromide:

Scopace™: 0.4 mg

Transdermal system:

Transderm Scōp®: 1.5 mg (4s, 10s, 24s) [releases ~1 mg over 72 hours]

Generic AvailableYes: Injection

Pricing: U.S. (www.drugstore.com)

Patch, 72-hour (Transderm-Scop)

1.5 mg (4): $39.95

1.5 mg (10): $97.95

Solution (Isopto Hyoscine)

0.25% (5): $30.99

Tablets (Scopace)

0.4 mg (30): $21.10

Mechanism of ActionBlocks the action of acetylcholine at parasympathetic sites in smooth muscle, secretory glands and the CNS; increases cardiac output, dries secretions, antagonizes histamine and serotonin; dilates pupils

Pharmacodynamics/Kinetics

Onset of action: Oral, I.M.: 0.5-1 hour; I.V.: 10 minutes

Peak effect: 20-60 minutes; may take 3-7 days for full recovery; transdermal: 24 hours

Duration: Oral, I.M.: 4-6 hours; I.V.: 2 hours

Absorption: Tertiary salts (hydrobromide) are well absorbed; quaternary salts (butylbromide) are poorly absorbed (local concentrations in the GI tract following oral dosing may be high)

Metabolism: Hepatic

Half-life elimination: 4.8 hours

Excretion: Urine (<10%, as parent drug and metabolites)

Related Information

- Cycloplegic Mydriatics

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia (normal salivary flow resumes upon discontinuation), dry throat (transdermal), and dysphagia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness; may rarely cause confusion or amnesia

Mental Health: Effects on Psychiatric TreatmentMay decrease the effects of levodopa; concurrent use with psychotropics may produce additive sedation of anticholinergic side effects (dry mouth)

Cardiovascular ConsiderationsScopolamine, at usual recommended cardiovascular doses, causes blockade of muscarinic receptors at the cardiac SA-node and is parasympatholytic (ie, blocks vagal activity increasing heart rate). In administering scopolamine, it is important to recognize that lower doses (0.1 mg) may have vagal mimetic effects (ie, increase vagal tone causing paradoxical bradycardia). It is likely that the vagal tonic effects of scopolamine are mediated by blockade of muscarinic receptors at the level of the brain.

Anesthesia and Critical Care Concerns/Other ConsiderationsIn administering scopolamine, it is important to recognize that lower doses (0.1 mg) may have vagal mimetic effects (ie, increase vagal tone causing paradoxical bradycardia). It is likely that the vagal tonic effects of scopolamine are mediated by blockade of muscarinic receptors at the level of the brain. Disc is programmed to deliver *in vivo* 1 mg over 3 days.

Index TermsHyoscine Butylbromide; Hyoscine Hydrobromide; Scopolamine Base; Scopolamine Butylbromide; Scopolamine Hydrobromide

Medication Safety Issues

Sound-alike/look-alike issues:

Seconal® may be confused with Sectral®

Pronunciation(see koe BAR bi tal)

U.S. Brand NamesSeconal®

Pharmacologic CategoryBarbiturate

Use: Labeled IndicationsPreanesthetic agent; short-term treatment of insomnia

Dosing: Adults**Insomnia (hypnotic):** Oral: 100 mg/dose at bedtime; range: 100-200 mg/dose

Dosing: ElderlyNot recommended for use in the elderly (see Geriatric Considerations).

Dosing: Pediatric

Preoperative sedation: Oral: Children: 2-6 mg/kg (maximum dose: 100 mg/dose) 1-2 hours before procedure

Sedation: Oral: Children: 6 mg/kg/day divided every 8 hours

Dosing: Renal ImpairmentSlightly dialyzable (5% to 20%)

RestrictionsC-II

ContraindicationsHypersensitivity to barbiturates or any component of the formulation; marked hepatic impairment; dyspnea or airway obstruction; porphyria; pregnancy

Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypersensitivity reactions: Postmarketing studies have indicated that the use of hypnotic/sedative agents for sleep has been associated with hypersensitivity reactions including anaphylaxis as well as angioedema.
- Paradoxical responses: May cause paradoxical responses, including agitation and hyperactivity, particularly in acute pain, chronic pain and pediatric patients.
- Sleep-related activities: An increased risk for hazardous sleep-related activities such as sleep-driving; cooking and eating food, and making phone calls while asleep have also been noted. Discontinue treatment in patients who report a sleep-driving episode.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease; may cause hypotension.
- Depression: Use with caution in patients with depression or suicidal tendencies.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease; may cause respiratory depression.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; closely monitor elderly or debilitated patients for impaired cognitive or motor performance.
- Pediatrics: Use with caution in children.

Other warnings/precautions:

- Appropriate use: Symptomatic treatment of insomnia should be initiated only after careful evaluation of potential causes of sleep disturbance. Failure of sleep disturbance to resolve after 7-10 days may indicate psychiatric and/or medical illness.

- Withdrawal: Abrupt cessation may precipitate withdrawal, including status epilepticus in epileptic patients.

Geriatric ConsiderationsUse of this agent in the elderly is not recommended due to its long half-life and addiction potential.
Pregnancy Risk FactorD
LactationEnters breast milk/use caution (AAP rates "compatible")
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension

Central nervous system: Dizziness, lightheadedness, "hangover" effect, drowsiness, CNS depression, fever, confusion, mental depression, unusual excitement, nervousness, faint feeling, headache, insomnia, nightmares, hallucinations

Dermatologic: Exfoliative dermatitis, rash, Stevens-Johnson syndrome

Gastrointestinal: Nausea, vomiting, constipation

Hematologic: Agranulocytosis, megaloblastic anemia, thrombocytopenia, thrombophlebitis, urticaria

Local: Pain at injection site

Respiratory: Apnea, laryngospasm, respiratory depression

Postmarketing and/or case reports: Anaphylaxis, angioedema, complex sleep-related behavior (sleep-driving, cooking or eating food, making phone calls)

Metabolism/Transport Effects**Induces** CYP2A6 (strong), 2C8 (strong), 2C9 (strong)
Drug Interactions

Acetaminophen: Barbiturates may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Beta-Blockers: Barbiturates may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers: Barbiturates may increase the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Chloramphenicol: May decrease the metabolism of Barbiturates. Barbiturates may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Contraceptive (Progestins): Barbiturates may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Barbiturates may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Barbiturates may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2A6 Substrates: CYP2A6 Inducers (Strong) may increase the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inducers (Highly Effective) may increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inducers (Highly Effective) may increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

Disopyramide: Barbiturates may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Doxycycline: Barbiturates may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Etoposide: Barbiturates may increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Etoposide Phosphate: Barbiturates may decrease the serum concentration of Etoposide Phosphate. Barbiturates may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Felbamate: May increase the serum concentration of Barbiturates. *Risk C: Monitor therapy*

Griseofulvin: Barbiturates may decrease the absorption of Griseofulvin. *Risk D: Consider therapy modification*

LamoTRIgine: Barbiturates may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Meperidine: Barbiturates may enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

Methadone: Barbiturates may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Barbiturates may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Primidone: May enhance the adverse/toxic effect of Barbiturates. Primidone is converted to phenobarbital, and thus becomes additive with existing barbiturate therapy. *Risk C: Monitor therapy*

Propafenone: Barbiturates may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Pyridoxine: May increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

QuiNIDine: Barbiturates may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Teniposide: Barbiturates may increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Theophylline Derivatives: Barbiturates may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Barbiturates may increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the metabolism of Barbiturates. Barbiturates may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Barbiturates may increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersBlood pressure, heart rate, respiratory rate, CNS status

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess patient for history of addiction; long-term use can result in dependence, abuse, or tolerance and evaluate periodically for need for continued use. Be alert to possibility of anaphylaxis any time during therapy. Assess for CNS depression, abnormal thinking, and behavior changes. Monitor vital signs and respiratory status. After long-term use, taper dosage slowly when discontinuing. **Oral:** For inpatient use, institute safety measures. For outpatient use, monitor effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationUse exactly as directed; do not increase dose or frequency or discontinue without consulting prescriber. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol or other prescription or OTC medications (especially, pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help). Report skin rash or irritation; CNS changes (confusion, depression, increased sedation, excitation, headache, insomnia, or nightmares); respiratory difficulty or shortness of breath; difficulty swallowing or feeling of tightness in throat; unusual weakness or unusual bleeding in mouth, urine, or stool; unusual swelling, especially on face or neck; or other unanticipated adverse effects. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Use appropriate contraceptive measures. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as sodium: 100 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsules (Seconal)

100 mg (20): $25.99

Mechanism of ActionDepresses CNS activity by binding to barbiturate site at GABA-receptor complex enhancing GABA activity, depressing reticular activity system; higher doses may be gabamimetic

Pharmacodynamics/Kinetics

Onset of hypnosis: 15-30 minutes

Duration: 3-4 hours with 100 mg dose

Distribution: 1.5 L/kg; crosses the placenta; appears in breast milk

Protein binding: 45% to 60%

Metabolism: Hepatic, by microsomal enzyme system

Half-life elimination: 15-40 hours, mean: 28 hours

Time to peak, serum: Within 2-4 hours

Excretion: Urine (as inactive metabolites, small amounts as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

Secretin

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(SEE kr tin)
U.S. Brand NamesChiRhoStim®; SecreFlo™ [DSC]
Pharmacologic CategoryDiagnostic Agent
Use: Labeled IndicationsSecretin-stimulation testing to aid in diagnosis of pancreatic exocrine dysfunction; diagnosis of gastrinoma (Zollinger-Ellison syndrome); facilitation of endoscopic retrograde cholangiopancreatography (ERCP) visualization
Dosing: Adults**Note:** A test dose of 0.1 mL (0.2-0.4 mcg) is injected to test for possible allergy. Dosing may be completed if no reaction occurs after 1 minute.

Diagnosis of pancreatic dysfunction, facilitation of ERCP: I.V.: 0.2 mcg/kg over 1 minute

Diagnosis of gastrinoma: I.V.: 0.4 mcg/kg over 1 minute

Dosing: ElderlyRefer to adult dosing.
Administration: I.V.Administer by direct I.V. injection slowly over 1 minute
Administration: I.V. DetailpH: 3-6.5
Dietary ConsiderationsSecreFlo™: Patients should be in a fasting state (12- to 15-hour fast) prior to testing for gastrinoma.
StoragePrior to reconstitution, store frozen at -20°C. Protect from light. Human product may also be stored under refrigeration for up to 1 year or at room temperature for up to 6 months.
ReconstitutionAdd 8 mL NS to the 16 mcg vial to yield concentration of 2 mcg/mL; add 10 mL NS to the 40 mcg vial to yield a concentration of 4 mcg/mL; shake vigorously.
ContraindicationsHypersensitivity to secretin or any component of the formulation; acute pancreatitis
Warnings/Precautions

Concerns related to adverse effects:

- Allergic reaction: Potential for allergic reactions exists; test dose is recommended. Medications for the treatment of hypersensitivity should be available for immediate use. Patients with a history of asthma or atopy are at higher risk for reaction.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment (including ethanol-induced disease); volume response to secretin may be exaggerated.

- Inflammatory bowel disease: Response may be blunted in the presence of inflammatory bowel disease; blunted response is not indicative of pancreatic disease.

Concurrent drug therapy issues:

- Anticholinergics: Response may be blunted in the presence of anticholinergic agents; blunted response is not indicative of pancreatic disease.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Vagotomy: Response may be blunted following vagotomy; blunted response is not indicative of pancreatic disease.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

1% to 10%:

Cardiovascular: Flushing (1%)

Gastrointestinal: Nausea (1% to 2%), abdominal discomfort (≤1%), abdominal pain (≤1%), vomiting (≤1%)

Miscellaneous: Bleeding (sphincterectomy, ≤1%)

<1%: Abdominal cramps, anxiety, bloating, bradycardia (mild), diaphoresis, diarrhea, dyspepsia, faintness, fatigue, fever, headache, heart rate increased, hypotension, leukocytoplastic vasculitis, lightheadedness, numbness/tingling in the extremities, oral secretions increased, oxygen saturation decreased, pallor, pancreatitis (mild), rash (abdominal), respiratory distress (transient), sedation, seizure, warm sensation (abdomen/face)

Drug Interactions

Anticholinergic Agents: May diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Monitoring ParametersRefer to protocols for collection of pancreatic secretion and/or serum gastrin.
Monitoring: Lab TestsRefer to protocols for collection of pancreatic secretion and/or serum gastrin.
Patient EducationTake nothing by mouth for 12-15 hours prior to testing. May cause nausea, abdominal pain, and/or flushing.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, powder for reconstitution [human derived]:

ChiRhoStim®: 16 mcg

Injection, powder for reconstitution [porcine derived]:

SecreFlo™: 16 mcg [DSC]

Generic AvailableNo
Mechanism of ActionHuman and porcine secretin are both synthetically derived products and are equally potent on an osmolar basis. Secretin is a hormone which is normally secreted by duodenal mucosa and upper jejunal mucosa. It increases the volume and bicarbonate content of pancreatic juice; stimulates the flow of hepatic bile with a high bicarbonate concentration; stimulates gastrin release in patients with Zollinger-Ellison syndrome.
Pharmacodynamics/Kinetics

Onset of action: Peak output of pancreatic secretions: ~30 minutes

Duration: Human: 1.5-2 hours; Porcine: 1-1.5 hours

Distribution: V_d: Human: 2.7 L; Porcine: 2 L

Half-life elimination: Human: 45 minutes; Porcine: 27 minutes

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentConcomitant use with psychotropics may blunt the response to secretin stimulation.
Mental Health CommentUse caution in patients with ethanol-induced hepatic disease.
Index TermsSecretin, Human; Secretin, Porcine

Pharmacologic CategoryAnti-Parkinson's Agent, MAO Type B Inhibitor; Antidepressant, Monoamine Oxidase Inhibitor

Use: Labeled IndicationsAdjunct in the management of parkinsonian patients in which levodopa/carbidopa therapy is deteriorating (oral products); treatment of major depressive disorder (transdermal product)

Use: Unlabeled/InvestigationalEarly Parkinson's disease; attention-deficit/hyperactivity disorder (ADHD); negative symptoms of schizophrenia; extrapyramidal symptoms

Dosing: Adults

Parkinson’s disease:

Capsule/tablet: 5 mg twice daily with breakfast and lunch or 10 mg in the morning

Orally disintegrating tablet (Zelapar™): Initial 1.25 mg daily for at least 6 weeks; may increase to 2.5 mg daily based on clinical response (maximum: 2.5 mg daily)

Depression: Transdermal (Emsam®): Initial: 6 mg/24 hours once daily; may titrate based on clinical response in increments of 3 mg/day every 2 weeks up to a maximum of 12 mg/24 hours

Dosing: Elderly

Parkinson's disease:

Capsule/tablet: Initial: 5 mg in the morning; may increase to a total of 10 mg/day.

Orally disintegrating tablet (Zelapar™): Initial 1.25 mg daily for at least 6 weeks; may increase to 2.5 mg daily based on clinical response (maximum: 2.5 mg daily)

Depression: Transdermal (Emsam®): 6 mg/24 hours

Dosing: Pediatric**ADHD** (unlabeled use): Children and Adolescents: Oral: 5-15 mg/day

Dosing: Renal ImpairmentNo adjustment necessary.

Dosing: Hepatic ImpairmentNo adjustment necessary in mild-moderate hepatic impairment.

Administration: OralOrally disintegrating tablet (Zelapar™): Take in morning before breakfast; place on top of tongue and allow to dissolve. Avoid food or liquid 5 minutes before and after administration.

Administration: TopicalTransdermal (Emsam®): Apply to clean, dry, intact skin to the upper torso (below the neck and above the waist), upper thigh, or outer surface of the upper arm. Avoid exposure of application site to external heat source, which may increase the amount of drug absorbed. Apply at the same time each day and rotate application sites. Wash hands with soap and water after handling. Avoid touching the sticky side of the patch.

Dietary ConsiderationsAvoid tyramine-containing foods/beverages. Some examples include aged or matured cheese, air-dried or cured meats (including sausages and salamis), fava or broad bean pods, tap/draft beers, Marmite concentrate, sauerkraut, soy sauce and other soybean condiments.

Emsam® 9 mg/24 hours or 12 mg/24 hours: Avoid tyramine-rich foods or beverages beginning the first day of treatment or for 2 weeks after discontinuation or dose reduction to 6 mg/24 hours.

Zelapar™: Phenylalanine 1.25 mg per 1.25 mg tablet; do not take with food or liquid

Storage

Capsule, tablet: Store at controlled room temperature 15°C to 30°C (59°F to 86°F).

Orally-disintegrating tablet: Store at controlled room temperature 15°C to 30°C (59°F to 86°F). Use within 3 months of opening pouch and immediately after opening individual blister.

Transdermal: Store at 20°C to 25°C (68°F to 77°F).

Restrictions An FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing a transdermal selegiline outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

Contraindications Hypersensitivity to selegiline or any component of the formulation; concomitant use of meperidine

Orally disintegrating tablet: Additional contraindications: Concomitant use of dextromethorphan, methadone, propoxyphene, tramadol, oral selegiline, other MAO inhibitors

Transdermal: Additional contraindications: Pheochromocytoma; concomitant use of bupropion, selective or dual serotonin reuptake inhibitors (including SSRIs and SNRIs), tricyclic antidepressants, buspirone, tramadol, propoxyphene, methadone, dextromethorphan, St. John’s wort, mirtazapine, cyclobenzaprine, oral selegiline and other MAO inhibitors; carbamazepine, and oxcarbazepine; elective surgery requiring general anesthesia, local anesthesia containing sympathomimetic vasoconstrictors; sympathomimetics (and related compounds); foods high in tyramine content; supplements containing tyrosine, phenylalanine, tryptophan, or caffeine

Allergy Considerations

- Amphetamine Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings (transdermal product):

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription.**Transdermal selegiline is not FDA approved for use in children <12 years of age.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Selegiline is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Orthostatic hypotension: Transdermal product may cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

Disease-related concerns:

- Hepatic impairment: Use transdermal product with caution in patients with hepatic impairment.

- Renal impairment: Use transdermal product with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Antidepressants: Use of oral selegiline with tricyclic antidepressants and SSRIs has also been associated with rare reactions and should generally be avoided. Transdermal selegiline should not be used in combination with other antidepressants. Do not use within 5 weeks of fluoxetine discontinuation or 1 week of other antidepressant discontinuation. Wait 2 weeks after discontinuing transdermal selegiline before initiating therapy with buspirone or any other contraindicated drug.

- Levodopa: Addition of oral selegiline to levodopa therapy may result in exacerbation of levodopa adverse effects, requiring a reduction in levodopa dosage.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age (transdermal patch) or <16 years of age (orally-disintegrating formulation); there is no FDA-approved labeling for use of the oral capsule/tablet in children.

Other warnings/precautions:

- Discontinuation of therapy: Medication should not be stopped abruptly; taper off as rapidly as possible.

- Elective surgery: Discontinue transdermal product at least 10 days prior to elective surgery.

- Tyramine-containing products: Nonselective MAO inhibition occurs with transdermal delivery and is necessary for antidepressant efficacy. Hypertensive crisis as a result of ingesting tyramine-rich foods is always a concern with nonselective MAO inhibition. Although transdermal delivery minimizes inhibition of MAO-A in the gut, there is limited data with higher transdermal doses; dietary restrictions are recommended with doses >6 mg/24 hours. With the oral product, MAO-B selective inhibition should not pose a problem with tyramine-containing products as long as the typical oral doses are employed, however, rare reactions have been reported. Increased risk of nonselective MAO inhibition occurs with oral capsule/tablet doses >10 mg/day or orally disintegrating tablet doses >2.5 mg/day.

Geriatric ConsiderationsDo not use capsule/tablet at doses >10 mg/day or orally disintegrating tablet at doses >2.5 mg/day because of the risks associated with nonselective inhibition of MAO.

Orally-disintegrating tablets: In clinical trials, adverse effects were seen more frequently in the elderly compared to younger adults. This is particularly of concern for hypertension, orthostatic hypotension, dizziness, and somnolence. If using the orally disintegrating tablets, administer at the lowest dose and monitor for side effects.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic and adverse behavioral events were noted in animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsUnless otherwise noted, the percentage of adverse events is reported for the transdermal patch (**Note:** ODT = orally disintegrating tablet, Oral = capsule/tablet)

>10%:

Central nervous system: Headache (18%; ODT 7%; oral 2%), insomnia (12%; ODT 7%), dizziness (ODT 11%; oral 7%)

Gastrointestinal: Nausea (ODT 11%; oral 10%)

Local: Application site reaction (24%)

1% to 10%:

Cardiovascular: Hypotension (including postural 3% to 10%), chest pain (≥1%; ODT 2%), hypertension (≥1%), peripheral edema (≥1%)

Central nervous system: Pain (ODT 8%), hallucinations (ODT 4%; oral 3%), confusion (ODT 4%; oral 3%), ataxia (ODT 3%), somnolence (ODT 3%), agitation (≥1%), amnesia (≥1%), paresthesia (≥1%), thinking abnormal (≥1%), depression (<1%; ODT 2%)

Dermatologic: Rash (4%), ecchymosis (ODT 2%), bruising (≥1%), pruritus (≥1%), acne (≥1%)

Endocrine & metabolic: Weight loss (5%), hypokalemia (ODT 2%), sexual side effects (≤1%)

Gastrointestinal: Diarrhea (9%; ODT 2%), xerostomia (8%; ODT 4%), stomatitis (ODT 5%), abdominal pain (oral 4%), dyspepsia (4%; ODT 5%), constipation (≥1%; ODT 4%), flatulence (≥1%; ODT 2%), anorexia (≥1%), gastroenteritis (≥1%), taste perversion (≥1%; ODT 2%), vomiting (≥1%; ODT 3%), tooth disorder (ODT 2%), dysphagia (ODT 2%)

Genitourinary: Dysmenorrhea (≥1%), metrorrhagia (≥1%), UTI (≥1%), urinary frequency (≥1%)

Neuromuscular & skeletal: Dyskinesia (ODT 6%), back pain (ODT 5%), ataxia (<1%; ODT 3%), leg cramps (ODT 3%), myalgia (≥1%; ODT 3%), neck pain (≥1%), tremor (<1%; ODT 3%)

Otic: Tinnitus (≥1%)

Respiratory: Rhinitis (ODT 7%), pharyngitis (3%; ODT 4%), sinusitis (3%), cough (≥1%), bronchitis (≥1%), dyspnea (<1%; ODT 3%)

Miscellaneous: Diaphoresis (≥1%)

Oral and/or transdermal patch: <1% or frequency not defined (limited to important or life-threatening): Abnormal liver function tests, alkaline phosphatase increased, appetite increased, arrhythmia, asthma, ataxia, atrial fibrillation, bacterial infection, behavior/mood changes, bilirubinemia, bradycardia, bradykinesia, breast neoplasm (female), breast pain, chorea, circumoral paresthesia, colitis, dehydration, delusions, dental caries, depersonalization, depression, emotional lability, epistaxis, eructation, euphoria, face edema, fever, fungal infection, gastritis, generalized spasm, glossitis, heat stroke, hematuria (female), hernia, hostility, hypercholesterolemia, hyperesthesia, hyperglycemia, hyperkinesias, hypertonia, hypoglycemic reaction, hyponatremia, kidney calculus (female), lactate dehydrogenase increased, laryngismus, leukocytosis, leukopenia, libido increased, loss of balance, lymphadenopathy, maculopapular rash, manic reaction, melena, migraine, moniliasis, myasthenia, myocardial infarct, myoclonus, neoplasia, neurosis, osteoporosis, otitis external, palpitation, paranoid reaction, parasitic infection, parosmia, pelvic pain, periodontal abscess, peripheral vascular disorder, pneumonia, polyuria (female), prostatic hyperplasia, rectal hemorrhage, salivation increased, skin hypertrophy, skin benign neoplasm, suicide attempt, syncope, tachycardia, tenosynovitis, tongue edema, twitching, urinary retention, urinary urgency (male and female), urination impaired (male), urticaria, vaginal hemorrhage, vaginal moniliasis, vaginitis, vasodilatation, vertigo, vesiculobullous rash, viral infection, visual field defect

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2A6 (minor), 2B6 (major), 2C8 (minor), 2C19 (minor), 2D6 (minor), 3A4 (minor); **Inhibits** CYP1A2 (weak), 2A6 (weak), 2C9 (weak), 2C19 (weak), 2D6 (weak), 2E1 (weak), 3A4 (weak)

Drug Interactions

Alpha-/Beta-Agonists (Direct-Acting): MAO Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists (Indirect-Acting): MAO Inhibitors may enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Alpha1-Agonists: MAO Inhibitors may enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Alpha2-Agonists (Ophthalmic): MAO Inhibitors may enhance the hypertensive effect of Alpha2-Agonists (Ophthalmic). *Risk X: Avoid combination*

Altretamine: May enhance the orthostatic effect of MAO Inhibitors. *Risk C: Monitor therapy*

Amphetamines: MAO Inhibitors may enhance the hypertensive effect of Amphetamines. *Risk X: Avoid combination*

Anilidopiperidine Opioids: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. Management: Avoid use of fentanyl (and other anilidopiperidine opioids when possible) in patients who have used a monoamine oxidase inhibitor within the past 14 days due to reports of unpredictable but severe adverse effects. *Risk D: Consider therapy modification*

Atomoxetine: MAO Inhibitors may enhance the neurotoxic (central) effect of Atomoxetine. *Risk X: Avoid combination*

Beta2-Agonists: MAO Inhibitors may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: MAO Inhibitors may enhance the neurotoxic (central) effect of BuPROPion. *Risk X: Avoid combination*

BusPIRone: May enhance the adverse/toxic effect of MAO Inhibitors. Elevated blood pressure has been reported. *Risk X: Avoid combination*

COMT Inhibitors: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Cyclobenzaprine: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. *Risk X: Avoid combination*

CYP2B6 Inducers (Strong): May increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Moderate): May decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Strong): May decrease the metabolism of CYP2B6 Substrates. *Risk D: Consider therapy modification*

Dexmethylphenidate: MAO Inhibitors may enhance the hypertensive effect of Dexmethylphenidate. *Risk X: Avoid combination*

Dextromethorphan: MAO Inhibitors may enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

Levodopa: May enhance the adverse/toxic effect of MAO Inhibitors. Of particular concern is the development of hypertensive reactions when levodopa is used with nonselective MAOI. *Risk D: Consider therapy modification*

Linezolid: MAO Inhibitors may enhance the adverse/toxic effect of Linezolid. *Risk X: Avoid combination*

Lithium: MAO Inhibitors may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Maprotiline: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

Meperidine: MAO Inhibitors may enhance the serotonergic effect of Meperidine. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methyldopa: MAO Inhibitors may enhance the adverse/toxic effect of Methyldopa. *Risk X: Avoid combination*

Methylphenidate: MAO Inhibitors may enhance the hypertensive effect of Methylphenidate. *Risk X: Avoid combination*

Mirtazapine: MAO Inhibitors may enhance the neurotoxic (central) effect of Mirtazapine. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): May increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

Oral Contraceptive (Progestins): May increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

Propoxyphene: May enhance the adverse/toxic effect of MAO Inhibitors. Specifically, the risk of serotonin syndrome or other serotonergic adverse events may be increased. *Risk X: Avoid combination*

Rauwolfia Alkaloids: MAO Inhibitors may enhance the adverse/toxic effect of Rauwolfia Alkaloids. Existing MAOI therapy can result in paradoxical effects of added rauwolfia alkaloids (eg, excitation, hypertension). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Serotonin 5-HT1D Receptor Agonists: MAO Inhibitors may decrease the metabolism of Serotonin 5-HT1D Receptor Agonists. Management: If MAO inhibitor therapy is required, naratriptan, eletriptan or frovatriptan may be a suitable 5-HT1D agonist to employ. **Exceptions:** Eletriptan; Frovatriptan; Naratriptan. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Serotonin/Norepinephrine Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tetrabenazine: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

TraMADol: May enhance the neuroexcitatory and/or seizure-potentiating effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: MAO Inhibitors may enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (based on CNS depressant effects and potential tyramine content)

Food: Concurrent ingestion of foods rich in tyramine may cause sudden and severe high blood pressure (hypertensive crisis). Avoid tyramine-containing foods with MAO-Is. Food's freshness is also an important concern; improperly stored or spoiled food can create an environment where tyramine concentrations may increase.

Herb/Nutraceuticals: Avoid valerian, St John's wort, SAMe, kava kava. Avoid supplements containing caffeine, tryptophan, or phenylalanine. Ingestion of large quantities may increase the risk of severe side effects (eg, hypertensive reactions, serotonin syndrome).

Monitoring ParametersBlood pressure; symptoms of parkinsonism; general mood and behavior (increased anxiety, presence of mania or agitation); suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness according to rationale for therapy and adverse reactions at beginning of therapy and periodically throughout therapy. Monitor blood pressure. Be alert to thoughts of suicide. Patient should be cautioned against eating foods high in tyramine (see Tyramine Contents of Foods list). Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. Discontinue at least 10 days prior to elective surgery. Taper dose when discontinuing.

Patient EducationTake exactly as directed (may be prescribed in conjunction with levodopa/carbidopa); do not change dosage or discontinue without consulting prescriber. Therapeutic effects may take several weeks or months to achieve and you may need frequent monitoring during first weeks of therapy. Take oral capsule/tablet with meals if GI upset occurs, before meals if dry mouth occurs, or after eating if drooling or if nausea occurs. Do not take food or liquid for 5 five minutes before or after administering orally disintegrating tablets. Do not swallow orally disintegrating tablet; allow to dissolve on tongue. Take at the same time each day. Avoid tyramine-containing foods (low potential for reaction) with oral products. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Do not use alcohol, prescription or OTC sedatives, or CNS depressants without consulting prescriber. You may experience drowsiness, dizziness, confusion, or vision changes (use caution when driving, climbing stairs, or engaging in tasks requiring alertness until response to drug is known); orthostatic hypotension (use caution when changing position - rising to standing from sitting or lying); constipation (increased exercise, fluids, fruit, or fiber may help); runny nose or flu-like symptoms (consult prescriber for appropriate relief); or nausea, vomiting, loss of appetite, or stomach discomfort (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report unresolved constipation or vomiting; chest pain, palpitations, irregular heartbeat; CNS changes (hallucination, loss of memory, seizures, acute headache, nervousness, thoughts of suicide, etc); painful or difficult urination; stiff neck; increased muscle spasticity, rigidity, or involuntary movements; skin rash; or significant worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, oral, as hydrochloride: 5 mg

Eldepryl®: 5 mg

Tablet, oral, as hydrochloride: 5 mg

Tablet, orally-disintegrating:

Zelapar™: 1.25 mg [contains phenylalanine 1.25 mg/tablet]

Transdermal system, topical [once-daily patch]:

Emsam®: 6 mg/24 hours (30s) [20 cm^2, total selegiline 20 mg]; 9 mg/24 hours (30s) [30 cm^2, total selegiline 30 mg]; 12 mg/24 hours (30s) [40 cm^2, total selegiline 40 mg]

Generic AvailableYes: Capsule, tablet

Pricing: U.S. (www.drugstore.com)

Capsules (Eldepryl)

5 mg (60): $170.00

Capsules (Selegiline HCl)

5 mg (60): $28.96

Patch, 24-hour (Emsam)

6 mg/24 hrs (30): $518.92

9 mg/24 hrs (30): $528.66

Tablet, orally-disintegrating (Zelapar)

1.25 mg (30): $160.49

Tablets (Selegiline HCl)

5 mg (60): $35.98

Mechanism of ActionPotent, irreversible inhibitor of monoamine oxidase (MAO). Plasma concentrations achieved via administration of oral dosage forms in recommended doses confer selective inhibition of MAO type B, which plays a major role in the metabolism of dopamine; selegiline may also increase dopaminergic activity by interfering with dopamine reuptake at the synapse. When administered transdermally in recommended doses, selegiline achieves higher blood levels and effectively inhibits both MAO-A and MAO-B, which blocks catabolism of other centrally-active biogenic amine neurotransmitters.

Pharmacodynamics/Kinetics

Onset of action: Therapeutic: Oral: Within 1 hour

Duration: Oral: 24-72 hours

Absorption:

Orally disintegrating tablet: Rapid; greater bioavailability than capsule/tablet

Transdermal: 25% to 30% (of total selegiline content) over 24 hours

Protein binding: ~90%

Metabolism: Hepatic, primarily via CYP2B6 to active (N-desmethylselegiline, amphetamine, methamphetamine) and inactive metabolites

Half-life elimination: Oral: 10 hours; Transdermal: 18-25 hours

Excretion: Urine (primarily metabolites); feces

Related Information

- Antidepressant Agents
- Antiparkinsonian Agents
- Teratogenic Risks of Psychotropic Medications
- Tyramine Content of Foods

Pharmacotherapy Pearls When adding selegiline to levodopa/carbidopa, the dose of the latter can usually be decreased.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation). Anticholinergic side effects can cause a reduction of saliva production or secretion, contributing to discomfort and dental disease (ie, caries, oral candidiasis, and periodontal disease).

Orally disintegrating tablet: Dysphagia, tooth disorder, stomatitis, and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions Selegiline in doses of 10 mg a day or less does not inhibit type-A MAO. Therefore, there are no precautions with the use of vasoconstrictors.

Mental Health: Child/Adolescent Considerations Twenty-nine children 6-18 years of age (mean: 11.2 years) with ADHD refractory to conventional treatments received an average daily dose of 8.1 mg (5-15 mg/day) for an average of 6.7 months (Jankovic, 1993).

Two randomized, double-blind, placebo-controlled trials have shown selegiline to be as effective, and possibly better tolerated, than methylphenidate in the treatment of children (n=68, range: 4-15 years of age) with ADHD (Akhondzadeh, 2003; Mohammadi, 2004).

Akhondzadeh S, Tavakolian R, Davari-Ashtiani R, et al, “Selegiline in the Treatment of Attention Deficit Hyperactivity Disorder in Children: A Double Blind and Randomized Trial,” *Prog Neuropsychopharmacol Biol Psychiatry*, 2003, 27(5):841-5.

Jankovic J, “Deprenyl in Attention Deficit Associated With Tourette's Syndrome,” *Arch Neurol*, 1993, 50(3):286-8.

Mohammadi MR, Ghanizadeh A, Alaghband-Rad J, et al, “Selegiline in Comparison With Methylphenidate in Attention Deficit Hyperactivity Disorder Children and Adolescents in a Double-Blind, Randomized Clinical Trial,” *J Child Adolesc Psychopharmacol*, 2004, 14(3):418-25.

Mental Health Comment Selegiline is a selective MAO-B inhibitor when used in low oral doses (≤10 mg/day). The patch formulation inhibits both MAO-A and MAO-B inhibitors. When using the 6 mg/day patch, no special diet is required; however, when using the 9 mg/day or 12 mg/day patch a tyramine-restricted diet should be utilized.

Anesthesia and Critical Care Concerns/Other Considerations When adding selegiline to levodopa/carbidopa, the dose of the latter can usually be decreased. Studies are investigating the use of selegiline in early Parkinson's disease to slow the progression of the disease. With doses >10 mg/day, selegiline loses MAO type “B” specificity.

Index Terms Deprenyl; L-Deprenyl; Selegiline Hydrochloride

Use: Labeled IndicationsTreatment of itching and flaking of the scalp associated with dandruff, to control scalp seborrheic dermatitis; treatment of tinea versicolor

Dosing: Adults

Dandruff, seborrhea: Topical: Massage 5-10 mL of shampoo into wet scalp, leave on scalp 2-3 minutes, rinse thoroughly; rub foam into affected skin twice daily

Tinea versicolor: Topical: Apply the 2.5% lotion to affected area and lather with small amounts of water; leave on skin for 10 minutes, then rinse thoroughly; apply every day for 7 days; rub foam into affected skin twice daily

Dosing: ElderlyRefer to adult dosing.

Administration: TopicalShake well before using. May damage jewelry; remove before treatment. For external use only; do not apply to broken or inflamed skin.

Foam: Invert canister to administer.

Storage

Foam, shampoo: Store at controlled room temperature of 15°C to 25°C (59°F to 77°F).

Lotion: Store below 30°C (86°F)

ContraindicationsHypersensitivity to selenium or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Irritation: Discontinue use if irritation occurs.

Special populations:

- Pediatrics: Avoid topical use in very young children; safety of topical in infants has not been established.

Other warnings/precautions:

- Appropriate use: For external use only; avoid contact with eyes and genital areas. Due to the risk of systemic toxicity, do not use on damaged skin or mucous membranes

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have not been conducted. Avoid use in pregnant women unless the potential benefit justifies the potential risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined.

Central nervous system: Lethargy

Dermatologic: Alopecia or hair discoloration, unusual dryness or oiliness of scalp

Gastrointestinal: Vomiting following long-term use on damaged skin, abdominal pain, garlic breath

Local: Burning, itching, irritation, stinging (transient)

Neuromuscular & skeletal: Tremor

Miscellaneous: Diaphoresis

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Aerosol, topical [foam]:

Tersi: 2.25% (70 g)

Lotion, topical: 2.5% (120 mL)

Shampoo, topical: 1% (210 mL)

Dandrex: 1% (240 mL)

Head & Shoulders® Intensive Treatment: 1% (420 mL)

Selseb®: 2.25% (180 mL)

Selsun blue® Daily Treatment: 1% (207 mL, 325 mL)

Selsun blue® Medicated Treatment: 1% (120 mL, 207 mL, 325 mL) [contains menthol]

Selsun blue® Moisturizing Treatment: 1% (207 mL, 325 mL) [contains aloe and moisturizers]

Selsun blue® 2-in-1 Treatment: 1% (207 mL, 325 mL) [contains conditioner]

Generic AvailableYes: Excludes foam

Pricing: U.S. (www.drugstore.com)

Lotion (Selenium Sulfide)

2.5% (118): $19.99

Shampoo (Selseb)

2.25% (180): $96.84

Mechanism of ActionMay block the enzymes involved in growth of epithelial tissue

Pharmacodynamics/KineticsAbsorption: Topical: None through intact skin, but can be absorbed through damaged skin

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Perdiem® may be confused with Pyridium®

Senexon® may be confused with Cenestin®

Senokot® may be confused with Depakote®

Pronunciation(SEN na)

U.S. Brand NamesBlack-Draught Tablets [OTC]; Evac-U-Gen [OTC]; ex-lax® Maximum Strength [OTC]; ex-lax® [OTC]; Fletcher's® [OTC]; Little Tummys® Laxative [OTC]; Perdiem® Overnight Relief [OTC]; Senexon [OTC]; Senna-Gen® [OTC]; SenokotXTRA® [OTC]; Senokot® [OTC]; SenoSol™ [OTC] [DSC]; SenoSol™-X [OTC] [DSC]; Uni-Cenna [OTC] [DSC]

Pharmacologic CategoryLaxative, Stimulant

Use: Labeled IndicationsShort-term treatment of constipation; evacuate the colon for bowel or rectal examinations

Dosing: Adults

Bowel evacuation: Oral: OTC labeling: Usual dose: Sennosides 130 mg (X-Prep® 75 mL) between 2-4 PM the afternoon of the day prior to procedure

Constipation: Oral: OTC ranges: Sennosides 15 mg once daily (maximum: 70-100 mg/day, divided twice daily)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Bowel evacuation: OTC labeling: Children ≥12 years: Refer to adult dosing.

Constipation: OTC ranges: Children:

2-6 years:

Sennosides: Initial: 3.75 mg once daily (maximum: 15 mg/day, divided twice daily)

Senna concentrate: 33.3 mg/mL: 5-10 mL up to twice daily

6-12 years:

Sennosides: Initial: 8.6 mg once daily (maximum: 50 mg/day, divided twice daily)

Senna concentrate: 33.3 mg/mL: 10-30 mL up to twice daily

≥12 years: Refer to adult dosing.

Administration: OralOnce daily doses should be taken at bedtime. Granules may be eaten plain, sprinkled on food, or mixed in liquids

Dietary ConsiderationsLiquid may be administered with fruit juice or milk to mask taste. X-Prep® liquid contains sugar 50 g/75 mL.

ContraindicationsPer Commission E: Intestinal obstruction, acute intestinal inflammation (eg, Crohn's disease), colitis ulcerosa, appendicitis, abdominal pain of unknown origin; pregnancy

Allergy Considerations

- Anthraquinone Allergy

Warnings/Precautions

Other warnings/precautions:

- Self-medication (OTC use): Not recommended for use in patients experiencing stomach pain, nausea, vomiting, or a sudden change in bowel movements which lasts >2 weeks. Not recommended for OTC use in children <2 years of age.

Geriatric ConsiderationsElderly are often predisposed to constipation due to disease, immobility, drugs, and a decreased “thirst reflex” with age enhancing the possibility of dehydration. Avoid stimulant cathartic use on a chronic basis if possible. Use osmotic, lubricant, stool softeners, and bulk agents as prophylaxis. Patients should be instructed for proper dietary fiber and fluid intake as well as regular exercise. Monitor closely for fluid/electrolyte imbalance, CNS signs of fluid/electrolyte loss, and hypotension.

Adverse ReactionsFrequency not defined: Gastrointestinal: Nausea, vomiting, diarrhea, abdominal cramps

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringDetermine cause of constipation before treating. Teach patient proper use, side effects/interventions, and symptoms to report.

Patient EducationTake exactly as directed. DO NOT exceed recommended dosage; may cause dependence with prolonged or excessive use. Your urine may be discolored (red-brown) this is normal. Stop use and contact prescriber if you develop nausea, vomiting, persistent diarrhea, or abdominal cramps. If constipation worsens or you experience no relief contact prescriber. **Note:** Increased fluids, fruits, fiber, and exercise may help relieve constipation. OTC labeling does not recommend for use longer than 1 week in children <2 years of age or in women who are pregnant or nursing.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Liquid:

Senexon: Sennosides 8.8 mg/5 mL (240 mL) [contains propylene glycol]

Liquid [concentrate]:

Fletcher's®: Senna concentrate 33.3 mg/mL (75 mL) [alcohol free; contains sodium benzoate; root beer flavor]

Liquid [concentrate; drops]:

Little Tummys® Laxative: Sennosides 8.8 mg/1 mL (30 mL) [alcohol free, dye free; contains propylene glycol and soya lecithin; chocolate flavor]

Syrup: Sennosides 8.8 mg/5 mL (240 mL)

Tablet: Sennosides 8.6 mg

ex-lax®: Sennosides USP 15 mg

ex-lax® Maximum Strength: Sennosides USP 25 mg

Perdiem® Overnight Relief: Sennosides USP 15 mg

Senokot®, Senexon®, Senna-Gen®, SenoSol™ [DSC], Uni-Cenna [DSC]: Sennosides 8.6 mg

SenokotXTRA®, SenoSol™-X [DSC]: Sennosides 17 mg

Tablet, chewable:

Black-Draught™: Sennosides 10 mg

Sermorelin Acetate

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(ser moe REL in AS e tate)
U.S. Brand NamesGeref® Diagnostic [DSC]
Pharmacologic CategoryDiagnostic Agent
Use: Labeled Indications Geref® Diagnostic: For evaluation of the ability of the pituitary gland to secrete growth hormone (GH)
Dosing: Adults**Diagnostic aid:** I.V.: 1 mcg/kg as a single dose in the morning following an overnight fast
Dosing: ElderlyResponse to diagnostic test may be decreased in patients >40 years.
Dosing: Pediatric

Diagnostic: Children: Refer to adult dosing.

Administration: I.V.Diagnostic: Venous blood samples for growth hormone determinations should be drawn 15 minutes before and immediately prior to sermorelin administration. Administer a bolus of 1 mcg/kg/body weight sermorelin I.V. over 1-3 minutes at a final concentration not to exceed 100 mcg/mL followed by a 3 mL normal saline flush. Draw venous blood samples for growth hormone determinations at 15, 30, 45, and 60 minutes after sermorelin administration.
StorageLyophilized preparation must be stored in the refrigerator. Use immediately after reconstitution.
ReconstitutionEach ampul should be reconstituted with a minimum of 0.5 mL of the accompanying sterile diluent.
ContraindicationsHypersensitivity to sermorelin acetate, mannitol, or any component of the formulation
Allergy Considerations

- GH-RH Analog Allergy

Warnings/Precautions

Disease-related concerns:

- Acromegaly: Not used for the diagnosis of acromegaly.

Other warnings/precautions:

- Appropriate use: Thyroid status should be evaluated prior to treatment.

Pregnancy Risk FactorC
Pregnancy ConsiderationsSermorelin has been shown to produce minor variations in fetuses of rats and rabbits. There are no adequate and well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Tightness in the chest

Central nervous system: Headache, dizziness, hyperactivity, somnolence

Dermatologic: Transient flushing of the face, urticaria

Gastrointestinal: Dysphagia, nausea, vomiting

Local: Pain, redness, and/or swelling at the injection site

Drug InteractionsThere are no known significant interactions.
Test InteractionsSee Drug Interactions
Reference RangePeak growth hormone levels of >7-10 mcg/L are rarely achieved upon provocation in patients with classic growth hormone deficiency; a marked growth hormone response in these patients (>10-12 mcg/L) is strongly suggestive of hypothalamic dysfunction, as opposed to pituitary dysfunction
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, powder for reconstitution, as acetate: 50 mcg [packaged with diluent] [DSC]

Generic AvailableNo
ManufacturerSerono
Pharmacodynamics/KineticsOnset of action: Peak response: Diagnostic: Children 30 ± 27 minutes; Adults: 35 ± 29 minutes
Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Dysphagia.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness, sedation, or hyperactivity
Mental Health: Effects on Psychiatric TreatmentNone reported
International Brand NamesGeref (AT, BG, CH, DE, DK, ES, FI, GB, GR, IE, IT, MY, NO, PT, SE); Gerel (FR)

Sertaconazole

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(ser ta KOE na zole)
U.S. Brand NamesErtaczo®
Pharmacologic CategoryAntifungal Agent, Topical
Use: Labeled IndicationsTopical treatment of tinea pedis (athlete's foot)
Dosing: Adults**Tinea pedis:** Topical: Apply between toes and to surrounding healthy skin twice daily for 4 weeks
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Tinea pedis:** Topical: Children ≥12 years: Refer to adult dosing.
Administration: TopicalFor external use only. Apply to affected area between toes and to surrounding healthy skin. Make sure skin is dry before applying. Avoid use of occlusive dressing. Avoid contact with eyes, nose, mouth, and other mucous membranes.
StorageStore at 25°C (77°F).
ContraindicationsHypersensitivity to sertaconazole, other imidazoles (manufacturer-based contraindication), or any component of the formulation
Allergy Considerations

- Azole Antifungal Allergy

Warnings/Precautions

Concerns related to adverse effects:

• Irritation: Discontinue drug if sensitivity or irritation occurs.

Special populations:

• Immunocompromised patients: Has not been studied in immunocompromised patients.

• Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

• Appropriate use: For topical use only; avoid contact with eyes or vagina.

Pregnancy Risk FactorC
Pregnancy ConsiderationsThere are no adequate or well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

1% to 10%: Dermatologic: Burning, contact dermatitis, dry skin, tenderness

Postmarketing and/or case reports: Desquamation, erythema, hyperpigmentation, pruritus, vesiculation

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersReassess diagnosis if no clinical improvement after 2 weeks.
Nursing: Physical Assessment/MonitoringFor external use only; not for ophthalmic or intravaginal use. Teach patient proper use, appropriate interventions to reduce side effects, and adverse symptoms to report.
Patient EducationThis medication is for topical use only. Avoid contact with eyes, nose, mouth, and other mucous membranes. Use exactly as directed. Wash feet and dry thoroughly. Apply to affected area between toes and to surrounding healthy skin. Avoid use of occlusive dressing. Wash hands thoroughly after application; infection can be spread to other parts of your body or to other persons. Wear socks that keep your feet dry, and change them frequently if you perspire heavily. Do not share foot wear with others. May cause dry skin, mild tenderness, or slight discomfort (burning) after application. Stop using and contact prescriber if burning or tenderness persists or if other adverse skin reactions occur. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical, as nitrate:

Ertaczo®: 2% (30 g, 60 g)

Generic AvailableNo
ManufacturerDPT Laboratories
Pricing: U.S. (www.drugstore.com)

Cream (Ertaczo)

2% (30): $72.99

Mechanism of ActionAlters fungal cell wall membrane permeability; inhibits the CYP450-dependent synthesis of ergosterol

Pharmacodynamics/Kinetics

Absorption: Topical: Minimal

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsSertaconazole Nitrate

International Brand NamesDermofix (BE, ES, ID, KP, PT); Gyno-Zalain (PE); Monazol (FR); Zalain (AR, BO, BR, CN, CO, CR, CZ, DE, DO, EC, GT, HK, HN, MX, NI, PA, PE, PH, PL, PR, PY, SV, TH, TW, UY, VE)

Sertraline

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Sertraline may be confused with selegiline, Serentil®, Serevent®

Zoloft® may be confused with Zocor®

Pronunciation(SER tra leen)

U.S. Brand NamesZoloft®

Canadian Brand NamesApo-Sertraline®; CO Sertraline; Dom-Sertraline; Gen-Sertraline; GMD-Sertraline; Novo-Sertraline; Nu-Sertraline; PHL-Sertraline; PMS-Sertraline; ratio-Sertraline; Rhoxal-sertraline; Riva-Sertraline; Sandoz-Sertraline; Zoloft®

Pharmacologic CategoryAntidepressant, Selective Serotonin Reuptake Inhibitor

Use: Labeled IndicationsTreatment of major depression; obsessive-compulsive disorder (OCD); panic disorder; post-traumatic stress disorder (PTSD); premenstrual dysphoric disorder (PMDD); social anxiety disorder

Use: Unlabeled/InvestigationalEating disorders; generalized anxiety disorder (GAD); impulse control disorders; treatment of mild dementia-associated agitation in nonpsychotic patients

Dosing: Adults

Depression/obsessive-compulsive disorder: Oral: Initial: 50 mg/day

Note: May increase daily dose, at intervals of not less than 1 week, to a maximum of 200 mg/day. If somnolence is noted, give at bedtime.

Panic disorder, post-traumatic stress disorder, social anxiety disorder: Oral: Initial: 25 mg once daily; increased after 1 week to 50 mg once daily (see “Note” above)

Premenstrual dysphoric disorder: 50 mg/day either daily throughout menstrual cycle **or** limited to the luteal phase of menstrual cycle, depending on physician assessment. Patients not responding to 50 mg/day may benefit from dose increases (50 mg increments per menstrual cycle) up to 150 mg/day when dosing throughout menstrual cycle **or** up to 100 mg day when dosing during luteal phase only. If a 100 mg/day dose has been established with luteal phase dosing, a 50 mg/day titration step for 3 days should be utilized at the beginning of each luteal phase dosing period.

Dosing: ElderlyOral: Initial: 25 mg/day in the morning; increase by 25 mg/day increments every 2-3 days if tolerated to 50-100 mg/day; additional increases may be necessary; maximum: 200 mg/day. **Note:** Patients with Alzheimer’s dementia-related depression may require a lower starting dosage of 12.5 mg/day, with titration intervals of 1-2 weeks, up to 150-200 mg/day maximum.

Dosing: Pediatric

Obsessive-compulsive disorder: Oral: Children:

6-12 years: Initial: 25 mg once daily

13-17 years: Initial: 50 mg once daily

May increase daily dose, at intervals of not less than 1 week, to a maximum: 200 mg/day. If somnolence is noted, give at bedtime.

Dosing: Renal ImpairmentMultiple-dose pharmacokinetics are unaffected by renal impairment.

Hemodialysis effect: Not removed by hemodialysis

Dosing: Hepatic ImpairmentSertraline is extensively metabolized by the liver. Caution should be used in patients with hepatic impairment. A lower dose or less frequent dosing should be used.

Administration: OralOral concentrate: Must be diluted before use. Immediately before administration, use the dropper provided to measure the required amount of concentrate; mix with 4 ounces ($^{1}/_{2}$ cup) of water, ginger ale, lemon/lime soda, lemonade, or orange juice **only**. Do not mix with any other liquids than these. The dose should be taken immediately after mixing; do not mix in advance. A slight haze may appear after mixing; this is normal. **Note:** Use with caution in patients with latex sensitivity; dropper dispenser contains dry natural rubber.

StorageTablets and oral solution should be stored at controlled room temperature of 15°C to 30°C (59°F to 86°F).

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to sertraline or any component of the formulation; use of MAO inhibitors within 14 days; concurrent use of pimozide; concurrent use of sertraline oral concentrate with disulfiram

Allergy Considerations

- Selective Serotonin Reuptake Inhibitor (SSRI) Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Sertraline is not FDA approved for use in children with major depressive disorder (MDD). However, it is approved for the treatment of obsessive-compulsive disorder (OCD) in children ≥6 years of age.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Sertraline is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anticholinergic effects: Relatively devoid of these side effects

- Bleeding risk: May impair platelet aggregation resulting in increased risk of bleeding events, particularly if used concomitantly with aspirin, NSAIDs, warfarin or other anticoagulants. Bleeding related to SSRI use has been reported to range from relatively minor bruising and epistaxis to life-threatening hemorrhage.

- CNS depression: Has a low potential to impair cognitive or motor performance; caution operating hazardous machinery or driving.

- Sexual dysfunction: May cause or exacerbate sexual dysfunction.

- SIADH and hyponatremia: SSRIs and SNRIs have been associated with the development of SIADH; hyponatremia has been reported rarely (including severe cases with serum sodium <110 mmol/L), predominately in the elderly. Volume depletion and/or concurrent use of diuretics likely increases risk.

- Weight loss: May cause weight loss; use caution in patients where weight loss is undesirable.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; clearance is decreased and plasma concentrations are increased; a lower dosage may be needed.

- Other concurrent illness: Use caution in patients with certain concomitant systemic illness; due to limited experience.

- Renal impairment: Use with caution in patients with renal impairment; clearance is decreased and plasma concentrations are increased; a lower dosage may be needed.

- Seizure disorder: Use with caution in patients with a previous seizure disorder or condition predisposing to seizures such as brain damage or alcoholism.

- Uric acid nephropathy: Use with caution in patients at risk of uric acid nephropathy; sertraline acts as a mild uricosuric.

Concurrent drug therapy issues:

- Agents which lower seizure threshold: Concurrent therapy with other drugs which lower the seizure threshold.

- Anticoagulants/Antiplatelets: Use caution with concomitant use of NSAIDs, ASA, or other drugs that affect coagulation; the risk of bleeding may be potentiated.

- CNS depressants: Use caution with concomitant therapy.

- MAO inhibitors: Potential for severe reaction when used with MAO inhibitors; autonomic instability, coma, death, delirium, diaphoresis, hyperthermia, mental status changes/agitation, muscular rigidity, myoclonus, neuroleptic malignant syndrome features, and seizures may occur. Concomitant use is contraindicated.

- Serotonin syndrome: Symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia may occur with concomitant proserotonergic drugs (ie, SSRIs/SNRIs or triptans) or agents which reduce sertraline's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.

Special populations:

- Elderly: Use caution in elderly patients; risk of hyponatremia and other adverse events may be increased.
- Pediatrics: Monitor growth in pediatric patients.

Dosage form specific issues:

- Latex sensitivity: Use oral concentrate formulation with caution in patients with latex sensitivity; dropper dispenser contains dry, natural rubber.

Other warnings/precautions:

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.
- Withdrawal syndrome: May cause dysphoric mood, irritability, agitation, dizziness, sensory disturbances, anxiety, confusion, headache, lethargy, emotional lability, insomnia, hypomania, tinnitus, and seizures. Upon discontinuation of sertraline therapy, gradually taper dose. If intolerable symptoms occur following a decrease in dosage or upon discontinuation of therapy, then resuming the previous dose with a more gradual taper should be considered.

Geriatric ConsiderationsSertraline's favorable side effect profile makes it a useful alternative to the traditional tricyclic antidepressants; its potential stimulation effect and anorexia may be bothersome. Has the shortest half-life of the currently marketed serotonin-reuptake inhibitors. Data from a clinical trial comparing fluoxetine to tricyclics suggest that fluoxetine is significantly less effective than nortriptyline in hospitalized elderly patients with unipolar major affective disorder, especially those with melancholia and concurrent cardiovascular diseases. The elderly are more prone to SSRI/SNRI-induced hyponatremia.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDue to adverse effects observed in animal studies, sertraline is classified as pregnancy category C. Sertraline crosses the human placenta. Nonteratogenic effects in the newborn following SSRI exposure late in the third trimester include respiratory distress, cyanosis, apnea, seizures, temperature instability, feeding difficulty, vomiting, hypoglycemia, hypo- or hypertonia, hyper-reflexia, jitteriness, irritability, constant crying, and tremor. An increased risk of low birth weight, lower APGAR scores, and blunted behavioral response to pain for a prolonged period after delivery has also been reported. Exposure to SSRIs after the twentieth week of gestation has been associated with persistent pulmonary hypertension of the newborn (PPHN). Adverse effects may be due to toxic effects of the SSRI or drug discontinuation. The long-term effects of *in utero* SSRI exposure on infant development and behavior are not known.

Due to pregnancy-induced physiologic changes, women who are pregnant may require increased doses of sertraline to achieve euthymia. Women treated for major depression and who are euthymic prior to pregnancy are more likely to experience a relapse when medication is discontinued as compared to pregnant women who continue taking antidepressant medications. The ACOG recommends that therapy with SSRIs or SNRIs during pregnancy be individualized; treatment of depression during pregnancy should incorporate the clinical expertise of the mental health clinician, obstetrician, primary healthcare provider, and pediatrician (ACOG, 2007). If treatment during pregnancy is required, consider tapering therapy during the third trimester in order to prevent withdrawal symptoms in the infant. If this is done and the woman is considered to be at risk from her major depressive disorder, the medication can be restarted following delivery, although the dose should be readjusted to that required before pregnancy.

LactationEnters breast milk/use caution (AAP rates “of concern”)

Breast-Feeding ConsiderationsSertraline and desmethylsertraline are excreted in breast milk. Infants exposed to sertraline while breast-feeding generally receive a low relative dose and serum concentrations are not detectable in most infants. Adverse reactions have not been reported in nursing infants. Sertraline concentrations in the hindmilk are higher than in foremilk. If the benefits of the mother receiving the sertraline and breast-feeding outweigh the risks, the mother may consider pumping and discarding breast milk with the feeding 7-9 hours after the daily dose to decrease sertraline exposure to the infant. The long-term effects on development and behavior have not been studied. The manufacturer recommends that caution be exercised when administering sertraline to nursing women. The AAP recommends sertraline be considered “a drug for which the effect on nursing infants is unknown but may be of concern."

Adverse Reactions

>10%:

Central nervous system: Dizziness, fatigue, headache, insomnia, somnolence

Endocrine & metabolic: Libido decreased

Gastrointestinal: Anorexia, diarrhea, nausea, xerostomia

Genitourinary: Ejaculatory disturbances

Neuromuscular & skeletal: Tremors

Miscellaneous: Diaphoresis

1% to 10%:

Cardiovascular: Chest pain, palpitation

Central nervous system: Agitation, anxiety, hypoesthesia, malaise, nervousness, pain

Dermatologic: Rash

Endocrine & metabolic: Impotence

Gastrointestinal: Appetite increased, constipation, dyspepsia, flatulence, vomiting, weight gain

Neuromuscular & skeletal: Back pain, hypertonia, myalgia, paresthesia, weakness

Ocular: Visual difficulty, abnormal vision

Otic: Tinnitus

Respiratory: Rhinitis

Miscellaneous: Yawning

<1% (Limited to important or life-threatening), postmarketing, and/or case reports: Abdominal pain, acute renal failure, agranulocytosis, allergic reaction, anaphylactoid reaction, angioedema, aplastic anemia, atrial arrhythmia, AV block, bilirubin increased, blindness, bradycardia, cataract, dystonia, extrapyramidal symptoms, galactorrhea, gum hyperplasia, gynecomastia, hallucinations, hepatic failure, hepatitis, hepatomegaly, hyperglycemia, hyperprolactinemia, hypothyroidism, jaundice, leukopenia, lupus-like syndrome, micturition disorders, neuroleptic malignant syndrome, oculogyric crisis, serotonin syndrome, SIADH, Stevens-Johnson syndrome (and other severe dermatologic reactions), optic neuritis, pancreatitis (rare), photosensitivity, priapism, psychosis, PT/INR increased, pulmonary hypertension, QT_c prolongation, serum sickness, thrombocytopenia, torsade de pointes, transaminases increased, vasculitis, ventricular tachycardia

Additional adverse reactions reported in pediatric patients (frequency >2%): Aggressiveness, epistaxis, hyperkinesia, purpura, sinusitis, urinary incontinence

Metabolism/Transport Effects **Substrate** of CYP2B6 (minor), 2C9 (minor), 2C19 (major), 2D6 (major), 3A4 (minor); **Inhibits** CYP1A2 (weak), 2B6 (moderate), 2C8 (weak), 2C9 (weak), 2C19 (moderate), 2D6 (moderate), 3A4 (moderate)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alpha-/Beta-Blockers: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Alpha-/Beta-Blockers. *Risk C: Monitor therapy*

Analgesics (Opioid): May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Anticoagulants: Antiplatelet Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin Reuptake Inhibitor/Antagonist): Selective Serotonin Reuptake Inhibitors may enhance the serotonergic effect of Antidepressants (Serotonin Reuptake Inhibitor/Antagonist). This may cause serotonin syndrome. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of other Antiplatelet Agents. *Risk C: Monitor therapy*

Aspirin: Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Beta-Blockers: Selective Serotonin Reuptake Inhibitors may enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Acebutolol; Atenolol; Carteolol; Esmolol; Levobunolol; Metipranolol; Nadolol; Penbutolol. *Risk C: Monitor therapy*

BusPIRone: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. Selective Serotonin Reuptake Inhibitors may decrease the metabolism of BusPIRone. *Risk C: Monitor therapy*

CarBAMazepine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of CarBAMazepine. Specifically those SSRIs that inhibit CYP3A4 isoenzymes. CarBAMazepine may increase the metabolism of Selective Serotonin Reuptake Inhibitors. Specifically those agents metabolized via CYP1A2, 2C, and/or 3A4 isoenzymes. *Risk D: Consider therapy modification*

Cimetidine: May decrease the metabolism of Selective Serotonin Reuptake Inhibitors. *Risk D: Consider therapy modification*

Clozapine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2B6 Substrates: CYP2B6 Inhibitors (Moderate) may decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Cyproheptadine: May diminish the therapeutic effect of Selective Serotonin Reuptake Inhibitors. *Risk C: Monitor therapy*

Darunavir: May decrease the serum concentration of Sertraline. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Desmopressin: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dextromethorphan: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Dextromethorphan. *Risk D: Consider therapy modification*

Disulfiram: May enhance the adverse/toxic effect of Sertraline. This is specifically related to sertraline oral concentrate due to its alcohol content (12%). Management: Sertraline Oral Concentrate contains 12% alcohol, and its use should be avoided with disulfiram. *Risk X: Avoid* *combination*

Drotrecogin Alfa: Antiplatelet Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Efavirenz: May decrease the serum concentration of Sertraline. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Galantamine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Galantamine. *Risk C: Monitor therapy*

Haloperidol: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Haloperidol. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Antiplatelet Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Iobenguane I 123: Selective Serotonin Reuptake Inhibitors may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Selective Serotonin Reuptake Inhibitors. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methadone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Methadone. Fluvoxamine appears to be the only interacting SSRI. *Risk D: Consider therapy modification*

Metoclopramide: May enhance the adverse/toxic effect of Sertraline. Specifically, the risk of serotonin syndrome may be increased. *Risk C: Monitor therapy*

NSAID (COX-2 Inhibitor): Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of NSAID (COX-2 Inhibitor). *Risk D: Consider therapy modification*

NSAID (Nonselective): Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Phenytoin: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Pimozide. *Risk X: Avoid combination*

Propafenone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Propafenone. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Risperidone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Risperidone. *Risk C: Monitor therapy*

Salicylates: Antiplatelet Agents may enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Thrombolytic Agents: Antiplatelet Agents may enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

TraMADol: Selective Serotonin Reuptake Inhibitors may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. TraMADol may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tryptophan: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Selective Serotonin Reuptake Inhibitors may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Sertraline average peak serum levels may be increased if taken with food.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersMonitor nutritional intake and weight; mental status for depression, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased), anxiety, social functioning, mania, panic attacks; akathisia; growth in pediatric patients

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess mental status for worsening of depression, suicidal ideation, anxiety, social functioning, mania, or panic attack (especially during initiation of therapy and when dosage is changed). Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. Pediatric patients: Monitor growth pattern.

Patient EducationTake exactly as directed; do not increase dose or frequency; or discontinue use abruptly. It may take 2-3 weeks to achieve desired results. Take in the morning to reduce the incidence of insomnia. Avoid alcohol, caffeine, and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or lightheadedness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, anorexia, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); postural hypotension (use caution when climbing stairs or changing position from sitting or lying to standing); urinary pattern changes (void before taking medication); or male sexual dysfunction (reversible). Report persistent insomnia or daytime sedation, agitation, nervousness, fatigue; muscle cramping, tremors, weakness, or change in gait; chest pain, palpitations, or swelling of extremities; vision changes or eye pain; hearing changes (ringing in ears); respiratory difficulty or breathlessness; skin rash or irritation; suicidal ideation; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral [concentrate]: 20 mg/mL (60 mL)

Zoloft®: 20 mg/mL (60 mL) [contains ethanol 12%; natural rubber/natural latex in packaging]

Tablet: 25 mg, 50 mg, 100 mg

Zoloft®: 25 mg, 50 mg, 100 mg

Generic AvailableYes

ManufacturerMerck & Co

Pricing: U.S. (www.drugstore.com)

Concentrate (Zoloft)

20 mg/mL (60): $87.71

Tablets (Sertraline HCl)

25 mg (30): $19.99

50 mg (30): $14.99

100 mg (30): $15.99

Tablets (Zoloft)

25 mg (30): $101.33

50 mg (30): $99.99

100 mg (30): $104.84

Mechanism of ActionAntidepressant with selective inhibitory effects on presynaptic serotonin (5-HT) reuptake and only very weak effects on norepinephrine and dopamine neuronal uptake. *In vitro* studies demonstrate no significant affinity for adrenergic, cholinergic, GABA, dopaminergic, histaminergic, serotonergic, or benzodiazepine receptors.

Pharmacodynamics/Kinetics

Onset of action: Depression: The onset of action is within a week, however, individual response varies greatly and full response may not be seen until 8-12 weeks after initiation of treatment.

Absorption: Slow

Protein binding: 98%

Metabolism: Hepatic; may involve CYP2C19 and CYP2D6; extensive first pass metabolism; forms metabolite N-desmethylsertraline

Bioavailability: Bioavailability of tablets and solution are equivalent

Half-life elimination: Sertraline: 26 hours; N-desmethylsertraline: 66 hours (range: 62-104 hours)

Time to peak, plasma: Sertraline: 4.5-8.4 hours

Excretion: Urine and feces

Pharmacotherapy PearlsBuspirone (15-60 mg/day) may be useful in treatment of sexual dysfunction during treatment with a selective serotonin reuptake inhibitor. May exacerbate tics in Tourette's syndrome.

Dental Health Professional ConsiderationsProblems with SSRI-induced bruxism have been reported and may preclude their use; clinicians attempting to evaluate any patient with bruxism or involuntary muscle movement, who is simultaneously being treated with an SSRI drug, should be aware of the potential association.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) (see Dental Comment).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsAlthough caution should be used in patients taking tricyclic antidepressants, no interactions have been reported with vasoconstrictor and sertraline, a nontricyclic antidepressant which acts to increase serotonin; no precautions appear to be needed

Mental Health: Child/Adolescent ConsiderationsTwenty-nine children (6-12 years of age) and 32 adolescents (13-17 years of age) with major depression, obsessive-compulsive disorder, or both, received 25-200 mg/day (Alderman, 1998). Fifty-three children (6-12 years of age) and 39 adolescents (13-17 years of age) with obsessive-compulsive disorder (OCD) received up to 200 mg/day (March, 1998).

The efficacy of sertraline in the treatment of OCD was demonstrated in a 12-week, multicenter, placebo-controlled study with 187 outpatients 6-17 years of age. The safety of sertraline use in children and adolescents (6-18 years of age) was evaluated in a 12-week, multicenter, placebo-controlled study with 187 outpatients (6-17 years of age), and in a flexible dose, 52-week open extension study of 137 patients (6-18 years of age), who had completed the initial 12-week, double-blind, placebo-controlled study. Sertraline was administered at doses of either 25 mg/day (children 6-12 years of age) or 50 mg/day (adolescents 13-18 years of age). The dose was then titrated in weekly 25 mg/day or 50 mg/day increments, respectively, to a maximum dose of 200 mg/day based upon clinical response. The mean dose for completers was 157 mg/day. In the acute 12-week pediatric study and in the 52 week study, sertraline had an adverse event profile generally similar to that observed in adults (Zoloft® package insert, Pfizer, November, 2001).

A recent report describes 5 children (8-15 years of age) who developed epistaxis (n=4) or bruising (n=1) while receiving sertraline (Lake, 2000). Another recent report describes the SSRI discontinuation syndrome in 6 children; the syndrome was similar to that reported in adults (Diler, 2002).

Mental Health CommentThe SSRIs as a class are generally considered to be safe and equally effective. Allow sufficient dose-response time (6-12 weeks). Differences lie in approved indications, receptor profiles, pharmacokinetics, and cytochrome P450 activity profile. Subtle differences exist in adverse effect profiles. All SSRIs have the potential to cause sexual dysfunction. Among the SSRIs, sertraline is felt to be associated with the most GI side effects.

Anesthesia and Critical Care Concerns/Other ConsiderationsBuspirone (15-60 mg/day) may be useful in treatment of sexual dysfunction during treatment with a selective serotonin reuptake inhibitor; may exacerbate tics in Tourette's syndrome.

Index TermsSertraline Hydrochloride

Pronunciation(se VEL a mer)

U.S. Brand NamesRenagel®; Renvela®

Canadian Brand NamesRenagel®

Pharmacologic CategoryPhosphate Binder

Use: Labeled IndicationsReduction or control of serum phosphorous in patients with chronic kidney disease on hemodialysis

Dosing: Adults **Note:** The dosing of sevelamer carbonate and sevelamer hydrochloride are expected to be similar, when switching from one product to another, the same dose (on a mg per mg basis) should be utilized.

Control of serum phosphorous: Oral:

Patients not taking a phosphate binder: 800-1600 mg 3 times/day with meals; the initial dose may be based on serum phosphorous levels:

>5.5 mg/dL to <7.5 mg/dL: 800 mg 3 times/day

≥7.5 mg/dL to <9.0 mg/dL: 1200-1600 mg 3 times/day

≥9.0 mg/dL: 1600 mg 3 times/day

Maintenance dose adjustment based on serum phosphorous concentration (goal range of 3.5-5.5 mg/dL; maximum dose studied was equivalent to 13 g/day [sevelamer hydrochloride] or 14 g/day [sevelamer carbonate]):

>5.5 mg/dL: Increase by 1 tablet per meal at 2-week intervals

3.5-5.5 mg/dL: Maintain current dose

<3.5 mg/dL: Decrease by 1 tablet per meal

Dosage adjustment when switching between phosphate binder products: 667 mg of calcium acetate is equivalent to 800 mg sevelamer (carbonate or hydrochloride)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Control of serum phosphorous (unlabeled use):** Oral: Sevelamer hydrochloride: Doses of 121-163 mg/kg/day divided 3 times/day given with meals have been used in small studies. Doses should be rounded to nearest tablet size.

Maintenance dose adjustment based on serum phosphorous concentration (based on age).

Administration: OralMust be administered with meals. Tablets should be swallowed whole; do not crush, chew, or break.

Dietary ConsiderationsTake with meals. Reduced levels of folic acid, and vitamins D, E, and K may occur; most hemodialysis patients in clinical trials received vitamin supplementation.

StorageStore at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from moisture.

ContraindicationsHypophosphatemia; bowel obstruction

Warnings/Precautions

Disease-related concerns:

- Gastrointestinal disease: Use with caution in patients with gastrointestinal disorders including dysphagia, swallowing disorders, severe gastrointestinal motility disorders (including constipation), or major gastrointestinal surgery.

Concurrent drug therapy issues:

- Gastrointestinal binding: Sevelamer may bind to some drugs in the gastrointestinal tract and decrease their absorption. When changes in absorption of oral medications may have significant clinical consequences (such as antiarrhythmic and antiseizure medications), these medications should be taken at least 1 hour before or 3 hours after a dose of sevelamer.

- Vitamins: May cause reductions in vitamin D, E, K, and folic acid absorption.

Dosage form specific issues:

- Tablets: Should not be taken apart or chewed; broken or crushed tablets will rapidly expand in water/saliva and may be a choking hazard.

Geriatric ConsiderationsNo specific dose changes needed for the elderly. Since electrolyte changes (ie, phosphorus, calcium) can have dramatic effects in the elderly, monitor closely.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal studies have shown reduced or irregular ossification of fetal bones. Because sevelamer may cause a reduction in the absorption of some vitamins, it should be used with caution in pregnant women.
LactationExcretion in breast milk unknown/use caution (not absorbed systemically but may alter maternal nutrition)
Breast-Feeding ConsiderationsIt is not known whether sevelamer is excreted in human milk. Because sevelamer may cause a reduction in the absorption of some vitamins, it should be used with caution in nursing women.
Adverse Reactions**Note:** A decreased incidence of gastrointestinal adverse events was observed in a clinical trial of sevelamer carbonate compared to sevelamer hydrochloride.

>10%:

Dermatologic: Pruritus (13%)

Gastrointestinal: Vomiting (22%), nausea (7% to 20%), diarrhea (4% to 19%), dyspepsia (5% to 16%)

Neuromuscular & skeletal: Limb pain (13%), arthralgia (12%)

Respiratory: Nasopharyngitis (14%), bronchitis (11%)

1% to 10%:

Cardiovascular: Hypertension (10%)

Central nervous system: Headache (9%), pyrexia (5%)

Endocrine & metabolic: Hypercalcemia (5% to 7%)

Gastrointestinal: Abdominal pain (9%), flatulence (4% to 8%), constipation (2% to 8%)

Neuromuscular & skeletal: Back pain (4%)

Respiratory: Dyspnea (10%), cough (7%), upper respiratory tract infection (5%)

Miscellaneous: Peritonitis (peritoneal dialysis: 8%)

Postmarketing and/or case reports: Fecal impaction, ileus (rare), intestinal obstruction (rare), intestinal perforation (rare), rash

Drug Interactions

Mycophenolate: Sevelamer may decrease the serum concentration of Mycophenolate. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Sevelamer may decrease the absorption of Quinolone Antibiotics. *Risk D: Consider therapy modification*

Monitoring ParametersSerum chemistries, including phosphorus, calcium, bicarbonate, chloride
Nursing: Physical Assessment/MonitoringAssess knowledge/teach patient appropriate use, possible side effects/interventions, and adverse symptoms to report. Monitor blood pressure.
Monitoring: Lab TestsSerum chemistries, including phosphorus, calcium, bicarbonate, chloride
Patient EducationTake as directed, with meals. Do not break or chew tablets (contents will expand in water). You may experience headache or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or heartburn (small frequent meals, frequent mouth care, or sucking hard candy may help); diarrhea (yogurt or buttermilk may help); itching; or mild neuromuscular pain or stiffness (mild analgesic may help). Report persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as carbonate:

Renvela®: 800 mg

Tablet, as hydrochloride:

Renagel®: 400 mg, 800 mg

Generic AvailableNo
ManufacturerGenzyme Corp
Pricing: U.S. (www.drugstore.com)

Tablets (Renagel)

400 mg (180): $248.74

800 mg (30): $93.74

Mechanism of ActionSevelamer (a polymeric compound) binds phosphate within the intestinal lumen, limiting absorption and decreasing serum phosphate concentrations without altering calcium, aluminum, or bicarbonate concentrations. Increased serum bicarbonate levels have been observed with the use of sevelamer carbonate, compared to sevelamer hydrochloride.

Pharmacodynamics/Kinetics

Absorption: Not systemically absorbed

Excretion: Feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsSevelamer Carbonate; Sevelamer Hydrochloride

Medication Safety Issues

Sound-alike/look-alike issues:

Ultane® may be confused with Ultram®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(see voe FLOO rane)
U.S. Brand NamesSojourn™; Ultane®
Canadian Brand NamesSevorane® AF
Pharmacologic CategoryGeneral Anesthetic, Inhalation
Use: Labeled IndicationsInduction and maintenance of general anesthesia
Dosing: Adults**Anesthesia:** Inhalation: Minimum alveolar concentration (MAC), the concentration that abolishes movement in response to a noxious stimulus (surgical incision) in 50% of patients, is 2.6% (25 years of age) for sevoflurane. Surgical levels of anesthesia are generally achieved with concentrations from 0.5% to 3%; the concentration at which amnesia and loss of awareness occur is 0.6%.

Minimum alveolar concentrations (MAC) values for surgical levels of anesthesia:

25 years:

Sevoflurane in oxygen: 2.6%

Sevoflurane in 65% N_20/35% oxygen: 1.4%

40 years:

Sevoflurane in oxygen: 2.1%

Sevoflurane in 65% N_20/35% oxygen: 1.1%

60 years:

Sevoflurane in oxygen: 1.7%

Sevoflurane in 65% N_20/35% oxygen: 0.9%

80 years:

Sevoflurane in oxygen: 1.4%

Sevoflurane in 65% N_20/35% oxygen: 0.7%

Dosing: ElderlyRefer to adult dosing. MAC is reduced in the elderly (50% reduction by age 80).
Dosing: Pediatric**Anesthesia:** Inhalation: Minimum alveolar concentration (MAC), the concentration that abolishes movement in response to a noxious stimulus (surgical incision) in 50% of patients, is 2.6% (25 years of age) for sevoflurane. Surgical levels of anesthesia are generally achieved with concentrations from 0.5% to 3%; the concentration at which amnesia and loss of awareness occur is 0.6%.

Minimum alveolar concentrations (MAC) values for surgical levels of anesthesia:

0 to 1 month old full-term neonates: Sevoflurane in oxygen: 3.3%

1 to <6 months: Sevoflurane in oxygen: 3%

6 months to <3 years:

Sevoflurane in oxygen: 2.8%

Sevoflurane in 60% N_20/40% oxygen: 2%

3-12 years: Sevoflurane in oxygen: 2.5%

Dosing: Renal ImpairmentUse with caution in renal insufficiency.
Dosing: Hepatic ImpairmentUse with caution in patients with underlying hepatic conditions.
Administration: InhalationVia sevoflurane-specific calibrated vaporizers; use cautiously in low-flow or closed-circuit systems since sevoflurane is unstable and potentially toxic breakdown products have been liberated.

StorageStore at 15°C to 30°C (59°F to 86°F).

ContraindicationsPrevious hypersensitivity to sevoflurane, other halogenated anesthetics, or any component of the formulation; known or suspected susceptibility to malignant hyperthermia

Warnings/Precautions

Concerns related to adverse effects:

- Agitation/delirium: Monitor for emergence agitation or delirium.
- Hepatitis: Postoperative hepatitis or hepatic dysfunction with or without jaundice has rarely been reported.
- Hyperkalemia: Use of other inhaled anesthetics has been associated with rare cases of perioperative hyperkalemia; concomitant use of succinylcholine was associated with many of the reported cases, but not all. Risk of hyperkalemia is increased in pediatric patients with underlying neuromuscular disease (eg, Duchenne muscular dystrophy). Other abnormalities may include elevation in CPK and myoglobinuria. Monitor closely for arrhythmias. Aggressively identify and treat hyperkalemia.
- Increased intracranial pressure: May dilate the cerebral vasculature and may, in certain conditions, increase intracranial pressure.
- Malignant hyperthermia: May trigger malignant hyperthermia; avoid use in patients susceptible to malignant hyperthermia.
- Respiratory depression: Causes dose-dependent respiratory depression and blunted ventilatory response to hypoxia and hypercapnia. Hypoxic pulmonary vasoconstriction is blunted which may lead to increased pulmonary shunt.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; safety with severe impairment has not been established.
- Renal impairment: Use with caution in patients with renal impairment; safety with severe impairment has not been established.
- Seizure disorder: Use with caution in patients at risk for seizures; seizures have been reported in children and young adults.

Other warnings/precautions:

- Desiccated absorbents: Reaction of sevoflurane with CO_2 absorbents that become desiccated within circle breathing equipment can lead to formation of formaldehyde (causing respiratory irritation) and carbon monoxide; maintain fresh absorbent as per manufacturer guidelines regardless of state of colorimetric indicator. An exothermic reaction of sevoflurane with desiccated CO_2 absorbents has been reported to generate extreme heat, smoke and/or fire within breathing circuit. This reaction also leads to formation of a fluorinated byproduct, compound A, which has been reported to cause nephrotoxicity (eg, proteinuria, glycosuria) in animal studies. Compound A-induced renal toxicity is dose- and exposure time-dependent; minimize exposure risk by not exceeding 2 MAC hours and fresh flow rates <2 L/minute (low fresh gas flow rates maximize rebreathing of the anesthetic).

Pregnancy Risk FactorB

Breast-Feeding ConsiderationsConcentrations in breast milk are of no clinical importance 24 hours after anesthesia.

Adverse Reactions

>10%:

Cardiovascular: Hypotension (4% to 11% dose dependent)

Central nervous system: Agitation (7% to 15%)

Gastrointestinal: Nausea (25%), vomiting (18%)

Respiratory: Cough increased (5% to 11%)

1% to 10%:

Cardiovascular: Bradycardia (5%), tachycardia (2% to 6%), hypertension (2%)

Central nervous system: Somnolence (8%), dizziness (4%), hypothermia (1%), headache (1%), fever (1%), emergence delirium

Gastrointestinal: Salivation (2% to 4%)

Respiratory: Laryngospasm (2% to 8%), airway obstruction (8%), breath-holding (2% to 5%), apnea (2%)

Miscellaneous: Shivering (6%)

<1%, postmarketing, and/or case reports: Acidosis, albuminuria, alkaline phosphatase increased, allergic reactions, ALT increased, AST increased, amblyopia, anaphylactic/anaphylactoid reaction, arrhythmia, asthenia, atrial arrhythmia, atrial fibrillation, bigeminy, bilirubinemia, bronchospasm, BUN increased, complete AV block, confusion, conjunctivitis, creatinine increased, creatinine phosphokinase increased, crying, dry mouth, dyspnea, fluorosis, glycosuria, hemorrhage, hepatic dysfunction, hepatic failure, hepatic necrosis, hepatitis, hiccup, hyperglycemia, hyperkalemia (pediatric patients, postoperative), hypertonia, hyper-/hypoventilation, hypophosphatemia, hypoxia, insomnia, inverted T wave, jaundice, leukocytosis, LDH increased, liver enzymes increased, malignant hyperthermia, myoglobinuria, nervousness, oliguria, pain, pharyngitis, pruritus, rash, second-degree AV block, seizure, sputum, ST depression, stridor, supraventricular extrasystoles, syncope, taste perversion, thrombocytopenia, urinary retention, ventricular extrasystoles, wheezing

Metabolism/Transport Effects**Substrate** of CYP2A6 (minor), 2B6 (minor), 2E1 (major), 3A4 (minor)

Drug Interactions

CYP2E1 Inhibitors (Moderate): May decrease the metabolism of CYP2E1 Substrates. *Risk C: Monitor therapy*

CYP2E1 Inhibitors (Strong): May decrease the metabolism of CYP2E1 Substrates. *Risk D: Consider therapy modification*

EPINEPHrine: Inhalational Anesthetics may enhance the arrhythmogenic effect of EPINEPHrine. *Risk D: Consider therapy modification*

Methylphenidate: May enhance the hypertensive effect of Inhalational Anesthetics. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): Inhalational Anesthetics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Monitoring Parameters Blood pressure, temperature, heart rate and rhythm, oxygen saturation, end-tidal CO_2 and end-tidal sevoflurane concentrations should be monitored prior to and throughout anesthesia; temperature of CO_2 absorbent canister

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid for inhalation: 100% (250 mL)

Sojourn™, Ultane®: 100% (250 mL)

Generic Available Yes

Mechanism of Action Inhaled anesthetics alter activity of neuronal ion channels particularly the fast synaptic neurotransmitter receptors (nicotinic acetylcholine, GABA, and glutamate receptors). Limited effects on sympathetic stimulation including cardiovascular system. Seroflurane does not cause respiratory irritation or circulatory stimulation. May depress myocardial contractility, decrease blood pressure through a decrease in systemic vascular resistance and decrease sympathetic nervous activity.

Pharmacodynamics/Kinetics Sevoflurane has a low blood/gas partition coefficient and therefore is associated with a rapid onset of anesthesia and recovery

Onset of action: Time to induction: Within 2 minutes

Duration: Emergence time: Depends on blood concentration when sevoflurane is discontinued. The rate of change of anesthetic concentration in the lung is rapid with sevoflurane because of its low blood gas solubility (0.63). The 90% decrement time (time required for anesthetic concentration in vessel-rich tissues to decrease by 90%) for sevoflurane is short when the duration of anesthesia is <2 hours but increases dramatically as the duration of administration is lengthened.

Metabolism: 3% to 5% hepatic via CYP2E1

Excretion: Exhaled gases

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause agitation, somnolence, or dizziness

Mental Health: Effects on Psychiatric Treatment None reported

Anesthesia and Critical Care Concerns/Other Considerations When sevoflurane is used in conjunction with desiccated CO_2, isolated reports of fire or extreme heat in the respiratory circuit of anesthesia machines have been reported. Steps that might reduce the risk of these events include: Replace CO_2 absorbent if it has not been used for an extended period of time, shut off anesthesia machine at the end of clinical use or after any case when a subsequent extended period of nonuse is expected, turn off all vaporizers when not in use, verify the integrity of new CO_2 absorbents prior to use, monitor the temperature of the CO_2 absorbent canisters, and monitor the correlation between sevoflurane vaporizer setting and the inspired concentration.

Medication Safety Issues

Sound-alike/look-alike issues:

Meridia® may be confused with Aredia®

Pronunciation(si BYOO tra meen)
U.S. Brand NamesMeridia®
Canadian Brand NamesMeridia®
Pharmacologic CategoryAnorexiant; Sympathomimetic
Use: Labeled IndicationsManagement of obesity
Dosing: Adults**Obesity:** Oral:

Initial: 10 mg once daily; after 4 weeks may titrate up to 15 mg once daily as needed and tolerated (may be used for up to 2 years, per manufacturer labeling)

Maintenance: 5-15 mg once daily

Dosing: ElderlyUse with caution; adjust dose based on renal or hepatic function.
Dosing: PediatricChildren ≥16 years: Refer to adult dosing.
Dosing: Renal ImpairmentShould not be used in patients with severe renal impairment.
Dosing: Hepatic ImpairmentNo adjustment necessary for mild-to-moderate liver failure. Sibutramine should not be used in patients with severe liver failure.
Calculations

- Body Mass Index

Administration: OralMay take with or without food.
Dietary ConsiderationsSibutramine, as an appetite suppressant, is the most effective when combined with a low calorie diet and behavior modification counseling.
StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).
RestrictionsC-IV

Pharmacotherapy for weight loss is recommended only for obese patients with a body mass index ≥30 kg/m^2, or ≥27 kg/m^2 in the presence of other risk factors such as hypertension, diabetes, and/or dyslipidemia or a high waist circumference; therapy should be used in conjunction with a comprehensive weight management program. Rule out organic causes of obesity (eg, untreated hypothyroidism) prior to use.

ContraindicationsHypersensitivity to sibutramine or any component of the formulation; during or within 2 weeks of MAO inhibitors or concomitant centrally-acting appetite suppressants; anorexia nervosa, bulimia nervosa; poorly-controlled or uncontrolled hypertension, coronary artery disease, CHF arrhythmia; stroke
Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May impair the ability to engage in potentially hazardous activities.
- Hypertension: May cause increase in blood pressure; monitor baseline and on-therapy blood pressure. For patients experiencing a sustained increase in blood pressure dose reduction or discontinuation should be considered. Caution should be used in patients with hypertension and other cardiovascular conditions that might be exacerbated by increases in blood pressure. Should not be used in patients with coronary artery disease, HF, arrhythmia, or stroke.
- Primary pulmonary hypertension (PPH): A rare and frequently fatal pulmonary disease (PPH), has been reported to occur in patients receiving other agents with serotonergic activity which have been used as anorexiants. Although not reported in clinical trials, it is possible that sibutramine may share this potential; patients should be monitored closely.
- Tachycardia: May cause increased heart rate; monitor baseline and on-therapy pulse. For patients experiencing a sustained increase in pulse, dose reduction or discontinuation should be considered. Caution should be used in patients with hypertension and other cardiovascular conditions that might be exacerbated by increases heart rate. Should not be used in patients with coronary artery disease, CHF, arrhythmia. or stroke.
- Valvular heart disease: The use of some anorexigens has been associated with the development of valvular heart disease. Avoid stimulants in patients with known serious structural cardiac abnormalities, cardiomyopathy, serious heart rhythm abnormalities, or other serious cardiac problems that could increase the risk of sudden death that these conditions alone carry.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with bleeding disorders; rare cases of bleeding have occurred.
- Diabetes: Use with caution in patients with diabetes mellitus; antidiabetic agent requirements may be altered with anorexigens and concomitant dietary restrictions.
- Gallstones: Use with caution in patients with a history of gallstones; weight loss may precipitate or exacerbate gallstone formation.
- Glaucoma: Use with caution in patients with narrow-angle glaucoma; mydriasis has been reported.
- Hepatic impairment: Use with caution in patients with mild-moderate hepatic impairment; avoid use in severe impairment.
- Renal impairment: Use with caution in patients with mild-moderate renal impairment; avoid use in severe impairment.
- Psychiatric disorders: Use with caution and monitor closely in patients with a history of psychiatric symptoms; rare reports of depression, suicide and suicidal ideation have been documented in patients on sibutramine.
- Seizure disorders: Use with caution in patients with a history of seizure disorder; seizures have been reported with use.
- Tourette's syndrome: Use with caution in patients with Tourette's syndrome; stimulants may unmask tics.

Concurrent drug therapy issues:

- Serotonergic agents: As sibutramine blocks neuronal serotonin uptake, there is a potential for development of serotonin syndrome if used with other serotonergic agents; concurrent use of serotonergic agents (eg, SSRIs, sumatriptan, dihydroergotamine, dextromethorphan, meperidine, pentazocine, fentanyl, lithium) should be avoided.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <16 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies except at doses also causing maternal toxicity. There are no adequate and well-controlled studies in pregnant women. Use in pregnancy is not recommended.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Central nervous system: Headache (30%), insomnia (11%)

Gastrointestinal: Xerostomia (17%), anorexia (13%), constipation (12%)

1% to 10%:

Cardiovascular: Tachycardia (3%), vasodilation (2%), hypertension (2%), palpitation (2%), chest pain (2%)

Central nervous system: Dizziness (7%), nervousness (5%), anxiety (5%), depression (4%), somnolence (2%), CNS stimulation (2%), emotional lability (1%)

Dermatologic: Rash (4%)

Endocrine & metabolic: Dysmenorrhea (4%)

Gastrointestinal: Appetite increased (9%), nausea (6%), abdominal pain (5%), dyspepsia (5%), gastritis (2%), taste perversion (2%)

Genitourinary: Vaginal *Monilia* (1%)

Hepatic: Abnormal LFTs (2%)

Neuromuscular & skeletal: Back pain (8%), weakness (6%), arthralgia (6%), neck pain (2%), myalgia (2%), paresthesia (2%), tenosynovitis (1%), joint disorder (1%)

Otic: Ear disorder (2%)

Respiratory: Pharyngitis (10%), rhinitis (10%), sinusitis (5%), cough (4%)

Miscellaneous: Flu-like syndrome (8%), diaphoresis (3%), allergic reactions (2), thirst (2%)

<1%: Bruising

Frequency not defined:

Cardiovascular: Peripheral edema

Central nervous system: Thinking abnormal, agitation, fever

Dermatologic: Pruritus

Endocrine & metabolic: Menstrual disorders/irregularities

Gastrointestinal: Diarrhea, flatulence, gastroenteritis, tooth disorder

Neuromuscular & skeletal: Arthritis, hypertonia, leg cramps

Ocular: Amblyopia

Respiratory: Bronchitis, dyspnea

Postmarketing and/or case reports (frequency not defined; limited to important or life-threatening): Amnesia, anaphylactic shock, anaphylactoid reaction, anemia, angina, angioedema, arrhythmia, arthrosis, atrial fibrillation, blurred vision, cardiac arrest, cerebrovascular accident, CHF, cholecystitis, cholelithiasis, GI hemorrhage, goiter, hematuria, hyper-/hypoglycemia, hyper-/hypothyroidism, hypersensitivity reaction, impotence, interstitial nephritis, intestinal obstruction, intraocular pressure increased, leukopenia, lymphadenopathy, mania, mouth/stomach ulcer, mydriasis, photosensitivity, seizure, serotonin syndrome, stroke, suicidal ideation, syncope, thrombocytopenia, tongue edema, torsade de pointes, Tourette's syndrome, urinary retention, urticaria, transient ischemic attack, vascular headache, ventricular arrhythmia, vertigo

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ergot Derivatives: Sibutramine may enhance the serotonergic effect of Ergot Derivatives. This may cause serotonin syndrome. *Risk X: Avoid combination*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Serotonin Modulators: Sibutramine may enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid excess ethanol ingestion.

Herb/Nutraceutical: St John's wort and SAMe may decrease sibutramine levels.

Monitoring ParametersWeight, waist circumference, blood pressure, heart rate. Do initial blood pressure and heart rate evaluation and then monitor regularly during therapy. If patient has sustained increases in either blood pressure or pulse rate, consider discontinuing or reducing the dose of the drug.

Reference Range

Adult classification of weight by BMI (kg/m^2):

Underweight: <18.5

Normal: 18.5-24.9

Overweight: 25-29.9

Obese, class I: 30-34.9

Obese, class II: 35-39.9

Extreme obesity (class III): ≥40

Waist circumference: In adults with a BMI of 25-34.9 kg/m^2, high-risk waist circumference is defined as:

Men >102 cm (>40 in)

Women >88 cm (>35 in)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic response and periodically evaluate the need for continued use. Monitor vital signs, weight, and adverse reactions at start of therapy, when changing dosage, and at regular intervals during therapy. Assess knowledge/teach patient appropriate use, possible side effects, and symptoms to report.

Patient EducationTake exactly as directed; do not increase dose or frequency without consulting prescriber. May be taken with meals (do not take at bedtime). Avoid alcohol, caffeine, or OTC medications that act as stimulants. You may experience restlessness, dizziness, sleepiness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); insomnia (taking medication early in morning may help, warm milk, and quiet environment at bedtime may help); increased appetite, nausea or vomiting (small frequent meals, frequent mouth care may help); constipation (increased exercise, fluids, fruit, or fiber may help); diarrhea (buttermilk, boiled milk, or yogurt may help); or altered menstrual periods (reversible when drug is discontinued). Report chest pain, palpitations, or irregular heartbeat; excessive nervousness, excitation, or sleepiness; back pain, muscle weakness, or tremors; CNS changes (acute headache, aggressiveness, restlessness, excitation, sleep disturbances); menstrual pattern changes; rash; blurred vision; runny nose, sinusitis, cough, or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride:

Meridia®: 5 mg, 10 mg, 15 mg

Generic AvailableNo

ManufacturerKnoll Pharmaceutical Company

Pricing: U.S. (www.drugstore.com)

Capsules (Meridia)

5 mg (30): $104.47

10 mg (30): $109.99

15 mg (30): $133.89

Mechanism of ActionSibutramine and its two primary metabolites block the neuronal uptake of norepinephrine, serotonin, and (to a lesser extent) dopamine. There is no monoamine-releasing (or depleting) activity.

Pharmacodynamics/Kinetics

Absorption: 77%; rapid

Protein binding, plasma: Parent drug and metabolites: >94%

Metabolism: Hepatic; undergoes first-pass metabolism via CYP3A4; forms two primary metabolites (M_1 and M_2; active)

Half-life elimination: Sibutramine: 1 hour; Metabolites: M_1: 14 hours; M_2: 16 hours

Time to peak: Sibutramine: 1.2 hours; Metabolites (M_1 and M_2): 3-4 hours

Excretion: Primarily urine (77% as inactive metabolites); feces

Related Information

- Obesity Treatment Guidelines for Adults

Pharmacotherapy PearlsPhysicians should carefully evaluate patients for history of drug abuse and follow such patients closely, observing them for signs of misuse or abuse (eg, development of tolerance, excessive increases of doses, drug seeking behavior).

Dental Health Professional ConsiderationsThe mechanism of action is thought to be different from the “fen” drugs. Sibutramine works to suppress the appetite by inhibiting the reuptake of norepinephrine and serotonin. Unlike dexfenfluramine and fenfluramine, it is not a serotonin releaser. Sibutramine is closer chemically to the widely used antidepressants such as fluoxetine (Prozac®). The FDA approved sibutramine over the objections of its own advisory panel, who called the drug too risky. FDA reported that the drug causes blood pressure to increase, generally by a small amount, though in some patients the increases were higher. It is now recommended that patients taking sibutramine have their blood pressure evaluated regularly.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and taste perversion (see Dental Comment).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Cardiovascular ConsiderationsSibutramine may induce a significant blood pressure increase and should be avoided in patients with cardiovascular disease. The hypertensive effect of sibutramine may theoretically potentiate the nocturnal hypertension in patients with sleep apnea. Because this drug is used in the management of obesity, it is likely that many of the patients receiving it will have coexisting obstructive sleep apnea.

Unlike dexfenfluramine and fenfluramine, the medication does not cause the release of serotonin from neurons. Tests done on humans show no evidence of valvular heart disease and experiments done on animals show no evidence of the neurotoxicity which was found in similar testing using animals treated with fenfluramine and dexfenfluramine; has minimal potential for abuse.

Index TermsSibutramine Hydrochloride Monohydrate

Medication Safety Issues

Sound-alike/look-alike issues:

Revatio® may be confused with ReVia®

Sildenafil may be confused with silodosin, tadalafil, vardenafil

Viagra® may be confused with Allegra®, Vaniqa™

Pronunciation(sil DEN a fil)
U.S. Brand NamesRevatio®; Viagra®
Canadian Brand NamesViagra®
Pharmacologic CategoryPhosphodiesterase-5 Enzyme Inhibitor
Use: Labeled Indications

Revatio®: Treatment of pulmonary arterial hypertension (WHO Group I)

Viagra®: Treatment of erectile dysfunction (ED)

Use: Unlabeled/InvestigationalPulmonary arterial hypertension in children
Dosing: Adults

Erectile dysfunction (Viagra®): Oral: Usual dose: 50 mg once daily 1 hour (range: 30 minutes to 4 hours) before sexual activity; dosing range: 25-100 mg once daily.

Pulmonary arterial hypertension (Revatio®): Oral: 20 mg 3 times/day, taken 4-6 hours apart

Dosage considerations for patients stable on alpha-blockers: Viagra®: Initial: 25 mg

Dosage adjustment for concomitant use of potent CYP34A inhibitors:

Revatio®:

Erythromycin, saquinavir: No dosage adjustment

Itraconazole, ketoconazole, ritonavir: Not recommended

Viagra®:

Erythromycin, itraconazole, ketoconazole, saquinavir: Starting dose of 25 mg should be considered

Ritonavir: Maximum: 25 mg every 48 hours

Dosing: ElderlyElderly >65 years: Use with caution.

Revatio®: Refer to adult dosing.

Viagra®: Starting dose of 25 mg should be considered.

Dosing: Pediatric**Pulmonary arterial hypertension (unlabeled use):** Oral: Children ≥1 month: 0.25-2 mg/kg/dose every 4-6 hours. Most reports used 0.5 mg/kg/dose and titrated up to 2 mg/kg/dose
Dosing: Renal Impairment
Revatio®: Dose adjustment not necessary

Viagra®: Cl_{cr} <30 mL/minute: Starting dose of 25 mg should be considered.

Dosing: Hepatic Impairment

Revatio®: Child-Pugh class A and B: Dose adjustment not necessary.

Viagra®: Child-Pugh class A and B: Starting dose of 25 mg should be considered; not studied in severe impairment (Child-Pugh class C).

Administration: Oral
Revatio®: Administer tablets at least 4-6 hours apart

Viagra®: Administer orally 30 minutes to 4 hours before sexual activity

Storage Store tablets at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

Extemporaneously Prepared A stable suspension of sildenafil citrate (2.5 mg/mL) may be prepared as follows: Triturate thirty (30) sildenafil 25 mg tablets (Viagra®) to a fine powder in a mortar and pestle. Create a uniform paste by stirring in a small volume of suspending agent (1:1 mixture of methylcellulose 1% and simple syrup NF or a 1:1 mixture of Ora-Sweet® and Ora-Plus®). Continue adding vehicle to the paste in a geometric manner, with mixing, until near the desired volume. Transfer suspension to a graduated cylinder and QS to 300 mL with vehicle. Final suspension should be transferred to amber plastic bottles, labeled with “shake well” and dated for 90-day expiration at room temperature (25°C) or under refrigeration (4°C).

Nahata MC, Morosco RS, and Brady MT, “Extemporaneous Sildenafil Citrate Oral Suspensions for the Treatment of Pulmonary Hypertension in Children,” *Am J Health-Syst Pharm*, 2006, 63:254-7.

Contraindications Hypersensitivity to sildenafil or any component of the formulation; concurrent use (regularly/intermittently) of organic nitrates in any form (eg, nitroglycerin, isosorbide dinitrate)

Warnings/Precautions

Concerns related to adverse effects:

- Color discrimination: May cause dose-related impairment of color discrimination. Use caution in patients with retinitis pigmentosa; a minority have genetic disorders of retinal phosphodiesterases (no safety information available).

- Hearing loss: Sudden decrease or loss of hearing has been reported rarely; hearing changes may be accompanied by tinnitus and dizziness. A direct relationship between therapy and hearing loss has not been determined.

- Hypotension: Decreases in blood pressure may occur due to vasodilator effects; use with caution in patients with left ventricular outflow obstruction (aortic stenosis or hypertrophic obstructive cardiomyopathy); may be more sensitive to hypotensive actions. Concurrent use with alpha-adrenergic antagonist therapy or substantial alcohol consumption may cause symptomatic hypotension; patients should be hemodynamically stable prior to initiating therapy at the lowest possible dose.

- Vision loss: Vision loss may occur rarely and be a sign of nonarteritic anterior ischemic optic neuropathy (NAION). Risk may be increased with history of vision loss. Other risk factors for NAION include low cup-to-disc ratio (“crowded disc”), coronary artery disease, diabetes, hypertension, hyperlipidemia, smoking, and >50 years of age. Safety and efficacy were not studied in patients with known degenerative retinal disorders (eg, retinitis pigmentosa); use is not recommended. A direct relationship between therapy and vision loss has not been determined.

- Priapism: Painful erection >6 hours in duration; rare. Educate patient to seek medical assistance for erection lasting >4 hours.

Disease-related concerns:

- Anatomical penis deformation: Use with caution in patients with anatomical deformation of the penis (angulation, cavernosal fibrosis, or Peyronie's disease).

- Bleeding disorders: Use with caution in patients with bleeding disorders; safety and efficacy have not been established. *In vitro* studies have suggested a decreased effect on platelet aggregation.

- Cardiovascular disease: Use with caution in patients with hypotension (<90/50 mm Hg); uncontrolled hypertension (>170/110 mm Hg); life-threatening arrhythmias, stroke or MI within the last 6 months; cardiac failure or coronary artery disease causing unstable angina; safety and efficacy have not been studied in these patients. Use caution in patients with left ventricular outflow obstruction (eg, aortic stenosis). There is a degree of cardiac risk associated with sexual activity; therefore, physicians should consider the cardiovascular status of their patients prior to initiating any treatment for erectile dysfunction.

- Cardiovascular disease: Use is not recommended in patients with hypotension (<90/50 mm Hg); uncontrolled hypertension (>170/100 mm Hg); unstable angina or angina during intercourse; life-threatening arrhythmias, stroke or MI within the last 6 months; cardiac failure or coronary artery disease causing unstable angina. Safety and efficacy have not been studied in these patients. Use caution in patients with left ventricular outflow obstruction (eg, aortic stenosis). There is a degree of cardiac risk associated with sexual activity; therefore, physicians may wish to consider the cardiovascular status of their patients prior to initiating any treatment for erectile dysfunction.

- Conditions predisposing to priapism: Use with caution in patients who have conditions which may predispose them to priapism (sickle cell anemia, multiple myeloma, leukemia). All patients should be instructed to seek immediate medical attention if erection persists >4 hours.

- Hepatic impairment: Use with caution in patients with hepatic impairment; use lowest starting dose (25 mg).

- Peptic ulcer disease: Use with caution in patients with active peptic ulcer disease; safety and efficacy have not been established.

- Renal impairment: Use with caution in patients with renal impairment; dose adjustment may be needed; use lowest starting dose (25 mg) in severe dysfunction (Cl_{cr} <30 mL/minute).

Concurrent drug therapy issues:

- Alpha-blockers: Use with caution in patients taking alpha-blockers; may cause symptomatic hypotension. Safety of this combination may be affected by other antihypertensives and intravascular volume depletion. Patients should be hemodynamically stable prior to initiating therapy. Initiate sildenafil at the lowest recommended dose. Alpha-blockers should be initiated at the lowest recommended dose in patients currently receiving sildenafil.

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors (eg, ritonavir can increase sildenafil levels, initiate sildenafil at decreased dose; see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

- Nitrates: Concomitant (regularly/intermittently) use with all forms of nitrates is contraindicated. If nitrate administration is medically necessary, it is not known when nitrates can be safely administered following the use of sildenafil (per manufacturer); the ACC/AHA 2007 guidelines supports administration of nitrates only if 24 hours have elapsed.

- Other treatments for erectile dysfunction: Safety and efficacy with other treatments for erectile dysfunction have not been established; use is not recommended.

- Pulmonary arterial hypertension: Efficacy with concurrent bosentan therapy has not been evaluated; use with caution.

Special populations:

- Elderly: Use with caution; dose adjustment may be required.

Other warnings/precautions:

- Appropriate use: Potential underlying causes of erectile dysfunction should be evaluated prior to treatment.

Geriatric ConsiderationsSince the elderly often have concomitant diseases, many of which may contraindicate the use of sildenafil, a thorough knowledge of diseases and medications used must be assessed. Adjust dose for renal/hepatic function.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Less than 0.001% appears in the semen.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsBased upon normal doses for either indication. (Adverse effects such as flushing, diarrhea, myalgia, and visual disturbances may be increased with doses >100 mg/24 hours.)

>10%:

Central nervous system: Headache (16% to 46%)

Gastrointestinal: Dyspepsia (7% to 17%; dose related)

2% to 10%:

Cardiovascular: Flushing (10%)

Central nervous system: Insomnia (≤7%), pyrexia (6%), dizziness (2%)

Dermatologic: Erythema (6%), rash (2%)

Gastrointestinal: Diarrhea (3% to 9%), gastritis (≤3%)

Genitourinary: Urinary tract infection (3%)

Hepatic: LFTs increased

Neuromuscular & skeletal: Myalgia (≤7%), paresthesia (≤3%)

Ocular: Abnormal vision (color changes, blurred vision, or increased sensitivity to light 3% to 11%; dose related)

Respiratory: Epistaxis (9% to 13%), dyspnea exacerbated (≤7%), nasal congestion (4%), rhinitis (4%), sinusitis (3%)

<2%, postmarketing, and/or case reports (limited to important or life-threatening): Allergic reaction, amnesia (transient global), anemia, angina pectoris, anorgasmia, asthma, AV block, cardiac arrest, cardiomyopathy, cataract, cerebral thrombosis, cerebrovascular hemorrhage, colitis, cystitis, depression, dysphagia, edema, exfoliative dermatitis, eye hemorrhage, gout, hearing decreased, hearing loss, heart failure, hematuria, hemorrhage, hyper-/hypoglycemia, hypernatremia, hyper-/hypotension, hyperuricemia, intracerebral hemorrhage, intraocular pressure increased, leukopenia, migraine, myocardial ischemia, MI, myasthenia, mydriasis, neuralgia, nonarteritic ischemic optic neuropathy (NAION), palpitation, postural hypotension, priapism, pulmonary hemorrhage, rectal hemorrhage, retinal vascular disease or bleeding, seizure, shock, stomatitis, subarachnoid hemorrhage, syncope, tachycardia, tendon rupture, TIA, urinary incontinence, ventricular arrhythmia, vertigo, visual field loss, vitreous detachment/traction, vomiting

Metabolism/Transport Effects**Substrate** of CYP2C9 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2C9 (weak), 2C19 (weak), 2D6 (weak), 2E1 (weak), 3A4 (weak)

Drug Interactions

Alpha1-Blockers: Phosphodiesterase 5 Inhibitors may enhance the hypotensive effect of Alpha1-Blockers. **Exceptions:** Dapiprazole [Off Market]. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Phosphodiesterase 5 Inhibitors. *Risk D: Consider therapy modification*

Bosentan: May increase the metabolism of Sildenafil. Sildenafil may increase the serum concentration of Bosentan. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Etravirine: May decrease the serum concentration of Phosphodiesterase 5 Inhibitors. Management: No empiric dosage adjustments are recommended with concomitant therapy; however, dose of the phosphodiesterase inhibitor may need to be altered based on clinical response. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Sildenafil may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Pravastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Macrolide Antibiotics: May decrease the metabolism of Phosphodiesterase 5 Inhibitors. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the metabolism of Phosphodiesterase 5 Inhibitors. Management: Dose restrictions for tadalafil, and/or sildenafil and vardenafil are recommended in combination with ritonavir, atazanavir, indinavir, darunavir and saquinavir. Consult specific prescribing information for detailed recommendations. *Risk D: Consider therapy modification*

Sapropterin: May enhance the hypotensive effect of Phosphodiesterase 5 Inhibitors. *Risk C: Monitor therapy*

Vasodilators (Organic Nitrates): Phosphodiesterase 5 Inhibitors may enhance the vasodilatory effect of Vasodilators (Organic Nitrates). *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Amount and rate of absorption of sildenafil is reduced when taken with a high-fat meal. Serum concentrations/toxicity may be increased with grapefruit juice; avoid concurrent use.

Herb/Nutraceutical: St John's wort may decrease sildenafil levels.

Nursing: Physical Assessment/MonitoringMonitor other medications patient may be taking for effectiveness and interactions. Instruct patient on appropriate use and cautions, possible side effects, and symptoms to report

Patient EducationInform prescriber of all other medications you are taking; serious side effects can result when sildenafil is used with nitrates and some other medications. Avoid grapefruit juice. Do not combine sildenafil with other approaches to treating erectile dysfunction without consulting prescriber. **Note:** Sildenafil provides no protection against sexually-transmitted diseases, including HIV. You may experience headache, flushing, or abnormal vision (color changes, blurred or increased sensitivity to light); use caution when driving at night or in poorly lit environments. Report immediately acute allergic reactions; chest pain or palpitations; persistent dizziness; sign of urinary tract infection; skin rash; respiratory difficulty; change in vision; change in hearing or ringing in the ears; genital swelling; or other adverse reactions. If erection lasts longer than 4 hours, contact prescriber immediately; permanent damage to the penis can occur.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Revatio®: 20 mg

Viagra®: 25 mg, 50 mg, 100 mg

Generic AvailableNo

ManufacturerPfizer U.S. Pharmaceuticals Group

Pricing: U.S. (www.drugstore.com)

Tablets (Revatio)

20 mg (30): $448.07

Tablets (Viagra)

25 mg (10): $133.99

50 mg (10): $133.99

100 mg (10): $133.99

Mechanism of Action

Erectile dysfunction: Does not directly cause penile erections, but affects the response to sexual stimulation. The physiologic mechanism of erection of the penis involves release of nitric oxide (NO) in the corpus cavernosum during sexual stimulation. NO then activates the enzyme guanylate cyclase, which results in increased levels of cyclic guanosine monophosphate (cGMP), producing smooth muscle relaxation and inflow of blood to the corpus cavernosum. Sildenafil enhances the effect of NO by inhibiting phosphodiesterase type 5 (PDE-5), which is responsible for degradation of cGMP in the corpus cavernosum; when sexual stimulation causes local release of NO, inhibition of PDE-5 by sildenafil causes increased levels of cGMP in the corpus cavernosum, resulting in smooth muscle relaxation and inflow of blood to the corpus cavernosum; at recommended doses, it has no effect in the absence of sexual stimulation.

Pulmonary arterial hypertension (PAH): Inhibits phosphodiesterase type 5 (PDE-5) in smooth muscle of pulmonary vasculature where PDE-5 is responsible for the degradation of cyclic guanosine monophosphate (cGMP). Increased cGMP concentration results in pulmonary vasculature relaxation; vasodilation in the pulmonary bed and the systemic circulation (to a lesser degree) may occur.

Pharmacodynamics/Kinetics

Onset of action: ~60 minutes

Duration: 2-4 hours

Absorption: Rapid; slower with a high-fat meal

Distribution: V_{dss}: 105 L

Protein binding, plasma: ~96%

Metabolism: Hepatic via CYP3A4 (major) and CYP2C9 (minor route); forms metabolite (active)

Bioavailability: 40%

Half-life elimination: 4 hours

Time to peak: 30-120 minutes; delayed by 60 minutes with a high-fat meal

Excretion: Feces (80%); urine (13%)

Pharmacotherapy PearlsSildenafil is ~10 times more selective for PDE-5 as compared to PDE6. This enzyme is found in the retina and is involved in phototransduction. At higher plasma levels, interference with PDE6 is believed to be the basis for changes in color vision noted in some patients.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentUseful for psychotropic-induced sexual dysfunction

Cardiovascular ConsiderationsSildenafil, when used in conjunction with nitrates, may be associated with severe hypotension, myocardial infarction, and possibly death. While there are no clear significant increased cardiovascular events with PDE-5 inhibitors alone, this drug should be absolutely avoided in conjunction with nitrates and may also induce significant and possibly fatal hypotension in patients with heart failure. Hemodynamic effects of PDE-5 inhibitors alone include a very slight drop in blood pressure without significant changes in heart rate. The most recent guidelines on the use of sildenafil in patients with cardiovascular disease are outlined in detail (Cheitlin, 1999). The general clinical recommendations are as follows.

> Use of sildenafil is contraindicated in patients currently taking nitrate preparations.
>
> Cardiovascular effects of sildenafil may be potentially hazardous in patients with:
>
> - active coronary ischemia (not on nitrates)
> - heart failure and with borderline low blood pressure and borderline low volume status
> - complicated, multidrug antihypertensive regimens
> - potential for drug-drug interactions that may prolong sildenafil half-life (eg, drugs that predominantly inhibit cytochrome P450 3A4 - HMG-CoA reductase inhibitors, calcium channel blockers, ketoconazole, erythromycin etc)

Additional guidelines for the treatment of ED in patients with cardiovascular disease have also been published (Jackson, 2006). These guidelines, referred to as the Princeton II Guidelines, support the use of PDE-5 inhibition only in patients with asymptomatic coronary disease and <3 of the following risk factors: Controlled hypertension, mild stable angina, successful coronary revascularization, previous uncomplicated MI (>6-8 weeks), mild valvular disease, and left ventricular dysfunction (with or without NYHA Class I limitations).

When nitrate administration becomes medically necessary, the ACC/AHA 2004 guidelines on treatment of ST-segment elevation MI and the ACC/AHA 2007 guidelines on treatment of unstable angina/non ST-segment elevation MI supports administration of nitrates only if 24 hours have elapsed after use of sildenafil and 48 hours after use of tadalafil. The appropriate delay for the use of nitrates after vardenafil has not been determined.

Sildenafil is selective for PDE-5 and has limited effect on PDE-3, which controls cardiac contractility.

Anesthesia and Critical Care Concerns/Other Considerations

Use of sildenafil is contraindicated in patients currently taking nitrate preparations.

Cardiovascular effects of sildenafil may be potentially hazardous in patients with:

- active coronary ischemia (not on nitrates)
- congestive heart failure and with low blood pressure and low volume status
- complicated, multidrug antihypertensive regimens
- potential for drug-drug interactions that may prolong sildenafil half-life (eg, drugs that predominantly inhibit CYP3A4, such as HMG-CoA reductase inhibitors, protease inhibitors, certain macrolide antibiotics, imidazole antibiotics)

Silodosin

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Rapaflo® may be confused with Rapamune®, Raptiva®

Silodosin may be confused with sildenafil

Pronunciation(SI lo doe sin)

U.S. Brand NamesRapaflo®

Pharmacologic CategoryAlpha $_1$ Blocker

Use: Labeled IndicationsTreatment of signs and symptoms of benign prostatic hyperplasia (BPH)

Dosing: Adults**BPH:** Oral: 8 mg once daily with a meal

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} >50 mL/minute: No adjustment needed.

Cl_{cr} 30-50 mL/minute: 4 mg once daily.

Cl_{cr} <30 mL/minute: Use is contraindicated.

Dosing: Hepatic Impairment

Mild-to-moderate impairment (Child-Pugh classes A and B): No adjustment needed.

Severe impairment (Child-Pugh class C): Use is contraindicated.

Administration: OralAdminister once daily with a meal.

Dietary ConsiderationsTake with a meal.

StorageStore at room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light. Protect from moisture.

ContraindicationsConcurrent use with strong CYP3A4 inhibitors (eg, clarithromycin, itraconazole, ketoconazole, ritonavir); severe renal impairment (Cl_{cr} <30 mL/minute); severe hepatic impairment (Child-Pugh class C)

Warnings/Precautions

Concerns related to adverse effects:

- Floppy iris syndrome: Intraoperative floppy iris syndrome has been observed in cataract surgery patients who were on or were previously treated with alpha$_1$-blockers; causality has not been established and there appears to be no benefit in discontinuing alpha-blocker therapy prior to surgery.

- Orthostatic hypotension/syncope: May cause significant orthostatic hypotension and syncope, especially with first dose; anticipate a similar effect if therapy is interrupted for a few days, if dosage is rapidly increased, or if another antihypertensive drug (particularly vasodilators) or a PDE-5 inhibitor (eg, sildenafil, tadalafil, vardenafil) is introduced. “First-dose” orthostatic hypotension may occur 4-8 hours after dosing; may be dose related. Patients should be cautioned about performing hazardous tasks when starting new therapy or adjusting dosage upward.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with mild-to-moderate hepatic impairment; contraindicated with severe impairment; not studied.

- Prostate cancer: It is recommended to rule out prostatic carcinoma before beginning therapy.

- Renal impairment: Use with caution in patients with moderate renal impairment; dosage adjustment recommended. Contraindicated in patients with severe impairment (Cl_{cr} <30 mL/minute).

Concurrent drug therapy issues:

- High potential for interactions: Contraindicated in patients on strong CYP3A4 inhibitors.

Special populations:

- Females: Not indicated for use in women.

- Pediatrics: Not indicated for use in children.

Other warnings/precautions:

- Antihypertensive use: Not intended for use as an antihypertensive drug.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies; however, silodosin is not approved for use in women.

Adverse Reactions

>10%: Miscellaneous: Retrograde ejaculation (28%)

1% to 10%:

Cardiovascular: Orthostatic hypotension (3%)

Central nervous system: Dizziness (3%), headache (2%), insomnia (1% to 2%)

Gastrointestinal: Diarrhea (3%), abdominal pain (1% to 2%)

Genitourinary: PSA increased (1% to 2%)

Neuromuscular & skeletal: Weakness (1% to 2%)

Respiratory: Nasal congestion (2%), nasopharyngitis (2%), rhinorrhea (1% to 2%), sinusitis (1% to 2%)

<1%, postmarketing, and/or case reports: Hepatic impairment, intraoperative floppy iris syndrome (IFIS), jaundice, priapism, purpura, syncope, toxic skin eruption, transaminases increased

Drug Interactions

Alfuzosin: Alpha1-Blockers may enhance the antihypertensive effect of Alfuzosin. Risk of orthostatic hypotension or syncope may be increased. Alfuzosin may enhance the antihypertensive effect of Alpha1-Blockers. *Risk X: Avoid combination*

Alpha1-Blockers: May enhance the adverse/toxic effect of Silodosin. Of particular concern are the risk of postural hypotension, syncope, and/or hypotension. Silodosin may enhance the hypotensive effect of Alpha1-Blockers. Of particular concern are the risk of postural hypotension, syncope, and/or hypotension. *Risk X: Avoid combination*

Beta-Blockers: May enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. **Exceptions:** Levobunolol; Metipranolol. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Alpha1-Blockers may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Phosphodiesterase 5 Inhibitors: May enhance the hypotensive effect of Alpha1-Blockers. *Risk D: Consider therapy modification*

Tamsulosin: Alpha1-Blockers may enhance the antihypertensive effect of Tamsulosin. Risk of orthostatic hypotension or syncope may be increased. Tamsulosin may enhance the antihypertensive effect of Alpha1-Blockers. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: AUC decrease by 4% to 49% and C_{max} decreased by ~18% to 43% with moderate calorie/fat meal.

Herb/Nutraceutical: Avoid St. John's wort (may decrease the levels/effects of silodosin). Avoid herbs with hypotensive properties (black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, Shepherd's purse); may enhance the hypotensive effect of silodosin. Avoid saw palmetto (due to limited experience with this combination).

Monitoring ParametersBlood pressure; urinary symptoms

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Rapaflo®: 4 mg, 8 mg

Generic AvailableNo

ManufacturerWatson Laboratories, Inc

Mechanism of ActionSilodosin is a selective antagonist of alpha$_{1A}$-adrenoreceptors in the prostate and bladder. Smooth muscle tone in the prostate is mediated by alpha$_{1A}$-adrenoreceptors; blocking them leads to relaxation of smooth muscle in the bladder neck and prostate causing an improvement of urine flow and decreased symptoms of BPH. Approximately 75% of the alpha1-receptors in the prostate are of the alpha$_{1A}$ subtype.

Pharmacodynamics/Kinetics

Distribution: V_d: 49.5 L

Protein binding: ~97%

Metabolism: Extensive, via CYP3A4, glucuronidation, and alcohol and aldehyde dehydrogenase pathways; KMD-3213G (active *in vitro*) and KMD-3293 (not significant) metabolites formed

Bioavailability: ~32%

Half-life elimination: Healthy volunteers: Silodosin: 5-21 hours; KMD-3213G: ~24 hours

Time to peak, plasma: ~3 hours

Excretion: Feces (55%); urine (34%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Postural hypotension, particularly with initial dosing; dizziness; nasal congestion or rhinitis

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or insomnia

Mental Health: Effects on Psychiatric TreatmentContraindicated with potent CYP3A4 inhibitors (eg, nefazodone). May cause orthostatic hypotension; concomitant use with psychotropics may produce additive effects. Avoid use with St John's wort; levels of silodosin may be decreased.

Index TermsKMD 3213

Silver Nitrate

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(SIL ver NYE trate)

Pharmacologic Category[Antibiotic, Topical](); [Cauterizing Agent, Topical](); [Topical Skin Product, Antibacterial]()

Use: Labeled IndicationsCauterization of wounds and sluggish ulcers, removal of granulation tissue and warts; aseptic prophylaxis of burns

Dosing: Adults**Antiseptic:** Topical:

Sticks: Apply to mucous membranes and other moist skin surfaces only on area to be treated 2-3 times/week for 2-3 weeks.

Topical solution: Apply a cotton applicator dipped in solution on the affected area 2-3 times/week for 2-3 weeks.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Antiseptic:** Topical: Refer to adult dosing.

Administration: OtherApplicators are **not** for ophthalmic use.

StorageMust be stored in a dry place. Store in a tight, light-resistant container. Exposure to light causes silver to oxidize and turn brown. Dipping in water causes oxidized film to readily dissolve.

ContraindicationsHypersensitivity to silver nitrate or any component of the formulation; not for use on broken skin, cuts, or wounds

Warnings/Precautions

Concerns related to adverse effects:

- Skin discoloration: Prolonged use may result in skin discoloration.

Other warnings/precautions:

- Appropriate use: Do not use applicator sticks on the eyes.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Dermatologic: Burning and skin irritation, staining of the skin

Endocrine & metabolic: Hyponatremia

Hematologic: Methemoglobinemia

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersWith prolonged use, monitor methemoglobin levels

Nursing: Physical Assessment/MonitoringAssess knowledge/teach appropriate technique for topical application. Monitor for overuse symptoms.

Monitoring: Lab TestsWith prolonged use, monitor methemoglobin levels.

Patient EducationUse as directed; do not use more often than instructed. Store container in dry, dark place. Handle with care; silver nitrate stains skin, clothing and utensils. Discontinue and contact prescriber if treated areas worsen or if redness, or irritation develops in surrounding area. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Sticks: Apply to mucous membranes and other moist skin surfaces to be treated 2-3 times each week for 2-3 weeks. Not for ophthalmic use.

Solution: Apply to affected area with cotton applicator dipped in solution 2-3 times each week for 2-3 weeks.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Applicator sticks, topical: Silver nitrate 75% and potassium nitrate 25% (6”, 12”, 18”)

Solution, topical: 0.5% (960 mL); 10% (30 mL); 25% (30 mL); 50% (30 mL)

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Misc (Arzol Silver Nit Applicators)

75-25% (100): $49.27

Mechanism of ActionFree silver ions precipitate bacterial proteins by combining with chloride in tissue forming silver chloride; coagulates cellular protein to form an eschar; silver ions or salts or colloidal silver preparations can inhibit the growth of both gram-positive and gram-negative bacteria. This germicidal action is attributed to the precipitation of bacterial proteins by liberated silver ions. Silver nitrate coagulates cellular protein to form an eschar, and this mode of action is the postulated mechanism for control of benign hematuria, rhinitis, and recurrent pneumothorax.

Pharmacodynamics/Kinetics

Absorption: Because silver ions readily combine with protein, there is minimal GI and cutaneous absorption of the 0.5% and 1% preparations

Excretion: Highest amounts of silver noted on autopsy have been in kidneys, excretion in urine is minimal

Pharmacotherapy PearlsSilver nitrate solutions stain skin and utensils.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsAgNO$_3$

International Brand NamesMova Nitrat Pipette (PL)

Silver Sulfadiazine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(SIL ver sul fa DYE a zeen)

U.S. Brand NamesSilvadene®; SSD®; SSD® AF; Thermazene®

Canadian Brand NamesFlamazine®

Pharmacologic CategoryAntibiotic, Topical

Use: Labeled IndicationsPrevention and treatment of infection in second and third degree burns

Dosing: Adults**Antiseptic, burns:** Topical: Apply once or twice daily

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: TopicalApply with a sterile-gloved hand. Apply to a thickness $^{1}/_{16}$". Burned area should be covered with cream at all times.

StorageDiscard if cream is darkened (reacts with heavy metals resulting in release of silver).

ContraindicationsHypersensitivity to silver sulfadiazine or any component of the formulation; premature infants or neonates <2 months of age (sulfonamides may displace bilirubin and cause kernicterus); pregnancy (approaching or at term)

Allergy Considerations

- Sulfonamide Antibiotic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

- Systemic effects: Systemic absorption may be significant and adverse reactions may occur.

DIsease-related concerns:

- G6PD deficiency: Use with caution in patients with G6PD deficiency; hemolysis may occur.

- Hepatic impairment: Use with caution in patients with hepatic impairment; sulfadiazine may accumulate.

- Renal impairment: Use with caution in patients with renal impairment; sulfadiazine may accumulate.

Concurrent drug therapy issues:

- Analgesics: Use of an analgesic might be needed before application.

Geriatric ConsiderationsNo specific recommendations for use in the elderly.

Pregnancy Risk FactorB

LactationFor external use

Adverse ReactionsFrequency not defined.

Dermatologic: Itching, rash, erythema multiforme, discoloration of skin, photosensitivity

Hematologic: Hemolytic anemia, leukopenia, agranulocytosis, aplastic anemia

Hepatic: Hepatitis

Renal: Interstitial nephritis

Miscellaneous: Allergic reactions may be related to sulfa component

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersSerum electrolytes, urinalysis, renal function tests, CBC in patients with extensive burns on long-term treatment

Nursing: Physical Assessment/MonitoringAssess allergy history before treatment (sulfonamides). Assess results of laboratory tests, therapeutic effectiveness (development of granulation), adverse response (eg, rash, irritation, burning, itching of unburned areas). Monitor for hepatic, renal, or hematological response effects with long-term use or use over large areas.

Monitoring: Lab TestsSerum electrolytes, urinalysis, renal function, CBC in patients with extensive burns on long-term treatment

Patient EducationUsually applied by professional in burn care setting. Patient instruction should be appropriate to extent of burn, patient understanding, etc. Report persistent diarrhea.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical: 1% (25 g, 50 g, 85 g, 400 g)

Silvadene®, Thermazene®: 1% (20 g, 50 g, 85 g, 400 g, 1000 g)

SSD®: 1% (25 g, 50 g, 85 g, 400 g)

SSD® AF: 1% (50 g, 400 g)

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Cream (Silvadene)

1% (20): $23.94

1% (85): $25.05

1% (400): $60.00

Cream (Silver Sulfadiazine)

1% (50): $20.99

1% (85): $19.99

1% (400): $30.00

Mechanism of ActionActs upon the bacterial cell wall and cell membrane. Bactericidal for many gram-negative and gram-positive bacteria and is effective against yeast. Active against *Pseudomonas aeruginosa*, *Pseudomonas maltophilia*, *Enterobacter* species, *Klebsiella* species, *Serratia* species, *Escherichia coli*, *Proteus mirabilis*, *Morganella morganii*, *Providencia rettgeri*, *Proteus vulgaris*, *Providencia* species, *Citrobacter* species, *Acinetobacter calcoaceticus*, *Staphylococcus aureus*, *Staphylococcus epidermidis*, *Enterococcus* species, *Candida albicans*, *Corynebacterium diphtheriae*, and *Clostridium perfringens*
Pharmacodynamics/Kinetics

Absorption: Significant percutaneous absorption of silver sulfadiazine can occur especially when applied to extensive burns

Half-life elimination: 10 hours; prolonged with renal impairment

Time to peak, serum: 3-11 days of continuous therapy

Excretion: Urine (~50% as unchanged drug)

Related Information

- Sulfonamide Derivatives

Pharmacotherapy PearlsContains methylparaben and propylene glycol
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine

Special Alerts

Infants' Mylicon® Gas Relief Dye Free Drops: Recall Due to Possible Metal Fragments - November 2008

Johnson & Johnson Merck Consumer Pharmaceuticals Company (JJMCP) is voluntarily recalling Infants' Mylicon® Gas Relief Dye Free Drops distributed after October 5, 2008 due to concern that metal fragments may have been generated during the manufacturing process.

For more information, including lots involved, please refer to the FDA MedWatch alert: http://www.fda.gov/medwatch/safety/2008/safety08.htm#mylicon

Medication Safety Issues

Sound-alike/look-alike issues:

Simethicone may be confused with cimetidine

Mylanta® may be confused with Mynatal®

Mylicon® may be confused with Modicon®, Myleran®

Phazyme® may be confused with Pherazine®

Pronunciation(sye METH i kone)

U.S. Brand NamesEqualizer Gas Relief [OTC]; Gas-X® Extra Strength [OTC]; Gas-X® Infant [OTC]; Gas-X® Maximum Strength [OTC]; Gas-X® Thin Strips™ [OTC]; Gas-X® [OTC]; Gas-X®, Children's Tongue Twisters™ [OTC]; Genasyme® [OTC]; Infantaire Gas Drops [OTC]; Little Tummys® Gas Relief [OTC]; Mylanta® Gas Maximum Strength [OTC]; Mylicon® Infants [OTC]; Phazyme® Ultra Strength [OTC]

Canadian Brand NamesOvol®; Phazyme™

Pharmacologic CategoryAntiflatulent

Use: Labeled IndicationsPostoperative gas pain or for use in endoscopic examination; relief of bloating, pressure, and discomfort of gas

Dosing: Adults**Flatulence/bloating:** Oral: 40-360 mg after meals and at bedtime, as needed

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Flatulence/bloating:** Oral:

Infants and Children <2 years or <11 kg: 20 mg 4 times/day, as needed

Children >2 years or >11 kg: 40 mg 4 times/day, as needed

Children >12 years: Refer to adult dosing.

Administration: OralShake oral suspension (drops) before using; mix with water, infant formula, or other liquids.

Dietary ConsiderationsShould be taken after meals.

StorageStore at room temperature. Avoid high humidity and excessive heat.

ContraindicationsHypersensitivity to simethicone or any component of the formulation

Geriatric ConsiderationsBefore treating excess gas or pain due to gas accumulation, a thorough evaluation must be made to determine cause since many bowel diseases may present with flatulence and bloating.

Adverse ReactionsNo data reported

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb InteractionsFood: Avoid carbonated beverages and gas-forming foods.

Patient EducationSome tablets may be chewed thoroughly before swallowing, follow with a glass of water

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Softgels: 125 mg

Gas-X® Extra Strength, Mylanta® Gas Maximum Strength: 125 mg

Gas-X® Maximum Strength: 166 mg

Phazyme® Ultra Strength: 180 mg

Strips, oral:

Gas-X®, Children's Tongue Twisters™: 40 mg (16s) [sweet cinnamon flavor]

Gas-X® Thin Strips™: 62.5 mg (18s, 32s) [peppermint flavor]; 62.5 mg (18s) [cinnamon flavor]

Suspension, oral [drops]: 40 mg/0.6 mL (30 mL)

Equalizer Gas Relief, Genasyme®, Infantaire Gas: 40 mg/0.6 mL (30 mL)

Gas-X® Infant: 40 mg/0.6 mL (30 mL) [alcohol free; contains sodium benzoate]

Little Tummys® Gas Relief: 40 mg/0.6 mL (30 mL, 45 mL) [contains sodium benzoate; strawberry flavor]

Mylicon® Infants: 40 mg/0.6 mL (15 mL, 30 mL) [alcohol free; contains sodium benzoate; available in a nonstaining formula]

Tablet, chewable: 80 mg, 125 mg

Gas-X®: 80 mg [sodium free; contains calcium 30 mg/tablet; peppermint creme or cherry creme flavor]

Gas-X® Extra Strength: 125 mg [contains calcium 45 mg/tablet; peppermint creme or cherry creme flavor]

Genasyme®: 80 mg

Mylanta® Gas Maximum Strength: 125 mg [cherry and mint flavors]

Generic AvailableYes

Mechanism of ActionDecreases the surface tension of gas bubbles thereby disperses and prevents gas pockets in the GI system

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Jump To Field (Select Field Name)

Special Alerts

Ezetimibe (Zetia®), Ezetimibe/Simvastatin (Vytorin®), and Simvastatin (Zocor®): Completed Review of the ENHANCE Trial - January 2009

On January 25, 2008, the U.S. Food and Drug Administration (FDA) communicated that they would be reviewing the data from the Ezetimibe and Simvastatin in Hypercholesterolemia Enhances Atherosclerosis Regression (ENHANCE) trial (Kastelein, 2008).

The FDA has completed its review of the ENHANCE trial which evaluated the effects of simvastatin (Zocor®) and ezetimibe/simvastatin (Vytorin®) on carotid-artery intima-media thickness (CIMT) in patients with familial hypercholesterolemia. CIMT is a surrogate endpoint believed to translate in a reduction of future cardiovascular events. It is important to note that this was an imaging trial and was not powered for clinical outcomes (eg, MI, stroke). Following two years of treatment, CIMT was increased by 0.011 mm in the ezetimibe and simvastatin combination group and by 0.006 mm in the simvastatin alone group. This difference was not statistically significant even though the combination group demonstrated statistically significant greater reductions in LDL.

Possible explanations for this observation include: 1) Issues with enrolled patient population (eg, prior exposure to lipid-lowering therapy; baseline CIMT), 2) duration of trial, and 3) other unknown properties of ezetimibe that may negate the beneficial effects of statin therapy on LDL reduction.

Based on this information, the FDA has not changed its position that an elevated LDL level is a risk factor for cardiovascular disease and that lowering LDL reduces this risk. Three large clinical outcome trials evaluating the use of ezetimibe/simvastatin will be presented over the next 2-3 years.

Patients should not stop taking their ezetimibe/simvastatin (Vytorin®), ezetimibe (Zetia®), or simvastatin (Zocor®). Instead, patients should talk with their healthcare provider if they have questions about the ENHANCE trial.

For more information, U.S. healthcare professionals may refer to the following:

HMG-CoA Reductase Inhibitors: Evidence Does Not Suggest Increased Incidence of Amyotrophic Lateral Sclerosis (ALS) - Results of FDA Analysis - September 30, 2008

The U.S. Food and Drug Administration's (FDA) review of 41 long-term controlled clinical trials of HMG-CoA reductase inhibitors finds no evidence of an increased incidence of ALS (also known as Lou Gehrig's disease) related to these medications. This analysis occurred after the FDA had received notice of numerous adverse events of which 109 of these reports mentioned ALS, Lou Gehrig's disease, or motor neurone disease. The clinical trials included in the analysis had a median duration of treatment of 3.3 years (range of duration: 6 months to 5 years) and involved 120,964 patients. The analysis identified a total of 19 cases of ALS – 9 cases per 64,602 patients (0.014%) with statin therapy and 10 cases per 56,362 patients (0.017%) with placebo. The incidence rates, based on approximately 400,000 person-years, were 4.2 per 100,000 person-years in the statin-treated group and 5 per 100,000 person-years in the placebo-treated group.

The FDA recommends that health care providers continue to prescribe, and patients continue to use these products as described within their labeling.

For more information, healthcare professionals may refer to the following:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#Statin

Ezetimibe (Zetia®), Simvastatin (Zocor®), and Ezetimibe/Simvastatin (Vytorin®): Preliminary Results From the SEAS Trial - Updated September 2008

The U.S. Food and Drug Administration (FDA) has communicated important information regarding an ongoing safety review of the Simvastatin and Ezetimibe in Aortic Stenosis (SEAS) trial. The SEAS trial (Rossebo, 2008), recently available online, evaluated the effects of the combination ezetimibe/simvastatin (Vytorin®) on clinical outcomes in patients with mild-to-moderate asymptomatic aortic stenosis. The 5-year trial demonstrated that ezetimibe/simvastatin was no better than placebo in reducing the primary composite outcomes – major cardiovascular events (eg, death from cardiovascular causes, aortic-valve replacement, heart failure) or the composite outcome of aortic-valve-related clinical events and ischemia. Additionally, a higher incidence of newly diagnosed cancer of any type (105 patients taking ezetimibe/simvastatin vs 70 patients taking placebo, p=0.01) and cancer-related death (39 patients taking ezetimibe/simvastatin vs 23 patients taking placebo, p=0.05) was observed in the patients receiving ezetimibe/simvastatin compared to those receiving placebo. Of note, 8 patients diagnosed with cancer prior to randomization experienced recurrence (3 in the ezetimibe/simvastatin group vs 5 in the placebo group).

Subsequently, an interim analysis of the ongoing Study of Heart and Renal Protection (SHARP) trial and the Improved Reduction of Outcomes: Vytorin Efficacy International Trial (IMPROVE-IT) with a total of 20,617 randomized patients demonstrated no overall excess of cancer (313 active-treatment vs 326 control, p=0.61) (Peto, 2008). The SHARP trial randomized patients with chronic kidney disease to either ezetimibe/simvastatin or placebo. The IMPROVE-IT trial randomized patients with acute coronary syndrome to either ezetimibe/simvastatin or simvastatin alone. When the SEAS trial data is included in this analysis, there still is no significant excess of cancer (414 active-treatment vs 391 control, p=0.46). However, cancer-associated deaths were significantly higher when compared to controls (134 vs 92, respectively; p=0.007). Previous trials and meta-analyses involving the use of ezetimibe, simvastatin, or ezetimibe/simvastatin also have not shown an increased risk of cancer.

The FDA estimates that it will take approximately 6 months to fully evaluate the clinical trial data after receipt of the final SEAS trial report. At this time, the FDA recommends that patients continue taking their cholesterol-lowering medications.

For more information, U.S. healthcare professionals may refer to the following:

Rossebo AB, Pederson TR, Boman K, et al, “Intensive Lipid Lowering With Simvastatin and Ezetimibe in Aortic Stenosis,” *N Engl J Med*, 2008, http://content.nejm.org/cgi/content/full/NEJMoa0804602

Simvastatin and Amiodarone Concurrent Therapy: Dose-Related Increased Risk of Rhabdomyolysis - August 2008

The U.S. Food and Drug Administration (FDA) has issued an alert to remind practitioners of a dose-related increased risk of rhabdomyolysis when amiodarone is used concurrently with simvastatin at doses >20 mg. If patients require simvastatin >20 mg, an alternative HMG-CoA reductase inhibitor (statin) should be used. This information has previously been incorporated into the Lexi-Comp monograph.

Additional information may be found at http://www.fda.gov/cder/drug/InfoSheets/HCP/simvastatin_amiodaroneHCP.htm

Ezetimibe/Simvastatin (Vytorin®), Ezetimibe (Zetia®), and Simvastatin (Zocor®): ENHANCE Results - January, 2008

The U.S. Food and Drug Administration (FDA) is communicating important information regarding the preliminary results of the Effect of Combination Ezetimibe and High-Dose Simvastatin vs. Simvastatin Alone on the Atherosclerotic Process in Patients with Heterozygous Familial Hypercholesterolemia (ENHANCE) trial, originally released on January 14, 2008, by Merck/Schering Plough. This multinational, randomized, double-blind trial was conducted in 720 patients with heterozygous familial hypercholesterolemia (HeFH) over a two-year period. Patients were randomized to either ezetimibe 10 mg/simvastatin 80 mg (Vytorin®) or simvastatin 80 mg alone (Zocor®). The primary endpoint of the trial was mean change in carotid intima-media thickness (CIMT) which is a surrogate endpoint believed to translate in a reduction of future cardiovascular events. It is important to note that this was an imaging trial and was not powered for clinical outcomes (eg, MI, stroke). Although ezetimibe/simvastatin lowered LDL cholesterol more effectively as compared to simvastatin alone, there was no difference seen in mean change in CIMT. Adverse events were similar between both groups.

Upon completion of full data analysis, the manufacturer will submit a final report to the FDA. Once the report is received, the FDA estimates it will take about 6 months to fully evaluate the data and decide whether or not further regulatory action is necessary. Three large clinical outcome trials evaluating the use of ezetimibe/simvastatin will be presented over the next 2-3 years.

At this point in time, patients should not stop taking their ezetimibe/simvastatin (Vytorin®), ezetimibe (Zetia®), or simvastatin (Zocor®). Instead patients should talk with their healthcare provider if they have questions about the ENHANCE trial.

For more information, U.S. healthcare professionals may refer to the following:

FDA: http://www.fda.gov/medwatch/safety/2008/safety08.htm#Ezetimibe

American College of Cardiology (ACC) Statement on ENHANCE Trial: http://www.acc.org/enhance.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Zocor® may be confused with Cozaar®, Yocon®, Zoloft®

International issues:

Cardin® [Poland] may be confused with Cardene® which is a brand name for nicardipine in the U.S.

Cardin® [Poland] may be confused with Cardem® which is a brand name for celiprolol in Spain

Pronunciation(sim va STAT in)
U.S. Brand NamesZocor®
Canadian Brand NamesApo-Simvastatin®; CO Simvastatin; Dom-Simvastatin; Gen-Simvastatin; Novo-Simvastatin; Nu-Simvastatin; PHL-Simvastatin; PMS-Simvastatin; ratio-Simvastatin; Riva-Simvastatin; Sandoz-Simvastatin; Taro-Simvastatin; Zocor®
Pharmacologic CategoryAntilipemic Agent, HMG-CoA Reductase Inhibitor
Use: Labeled IndicationsUsed with dietary therapy for the following:

Secondary prevention of cardiovascular events in hypercholesterolemic patients with established coronary heart disease (CHD) or at high risk for CHD: To reduce cardiovascular morbidity (myocardial infarction, coronary revascularization procedures) and mortality; to reduce the risk of stroke and transient ischemic attacks

Hyperlipidemias: To reduce elevations in total cholesterol, LDL-C, apolipoprotein B, and triglycerides, and increase HDL-C in patients with primary hypercholesterolemia (elevations of 1 or more components are present in Fredrickson type IIa, IIb, III, and IV hyperlipidemias); treatment of homozygous familial hypercholesterolemia

Heterozygous familial hypercholesterolemia (HeFH): In adolescent patients (10-17 years of age, females >1 year postmenarche) with HeFH having LDL-C ≥190 mg/dL **or** LDL ≥160 mg/dL with positive family history of premature cardiovascular disease (CVD), or 2 or more CVD risk factors in the adolescent patient

Dosing: Adults**Note:** Doses should be individualized according to the baseline LDL-cholesterol levels, the recommended goal of therapy, and the patient's response; adjustments should be made at intervals of 4 weeks or more; doses may need adjusted based on concomitant medications

Homozygous familial hypercholesterolemia: Oral: 40 mg once daily in the evening **or** 80 mg/day (given as 20 mg, 20 mg, and 40 mg evening dose)

Prevention of cardiovascular events, hyperlipidemias: Oral: 20-40 mg once daily in the evening; range: 5-80 mg/day

Patients requiring only moderate reduction of LDL-cholesterol: May be started at 10 mg once daily

Patients requiring reduction of >45% in low-density lipoprotein (LDL) cholesterol: May be started at 40 mg once daily in the evening

Patients with CHD or at high risk for CHD: Dosing should be started at 40 mg once daily in the evening; simvastatin should be started simultaneously with diet therapy.

Dosage adjustment for simvastatin with concomitant medications:

Cyclosporine or danazol: Initial: 5 mg, should **not** exceed 10 mg/day

Gemfibrozil: Dose should **not** exceed 10 mg/day

Amiodarone or verapamil: Dose should **not** exceed 20 mg/day

Dosing: ElderlyOral: Initial: Maximum reductions in LDL-cholesterol may be achieved with daily dose ≤20 mg.
Dosing: PediatricHeFH: Oral: Children 10-17 years (females >1 year postmenarche): 10 mg once daily in the evening; range: 10-40 mg/day (maximum: 40 mg/day)

Dosage adjustment with concomitant medications: With concomitant amiodarone, cyclosporine, danazol, gemfibrozil, or verapamil: Refer to adult dosing.

Note: Doses should be individualized according to the baseline LDL-cholesterol levels, the recommended goal of therapy, and the patient's response; adjustments should be made at intervals of 4 weeks or more; doses may need adjusted based on concomitant medications

Dosing: Renal ImpairmentBecause simvastatin does not undergo significant renal excretion, modification of dose should not be necessary in patients with mild to moderate renal insufficiency.

Severe renal impairment: Cl_{cr} <10 mL/minute: Initial: 5 mg/day with close monitoring.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralMay be taken without regard to meals. Administer in the evening for maximal efficacy.
Dietary Considerations Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice.
StorageTablets should be stored in tightly-closed containers at temperatures between 5°C to 30°C (41°F to 86°F).
ContraindicationsHypersensitivity to simvastatin or any component of the formulation; active liver disease; unexplained persistent elevations of serum transaminases; pregnancy; breast-feeding
Allergy Considerations

- HMG-CoA Reductase Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Myopathy/rhabdomyolysis: Patients receiving HMG-CoA reductase inhibitors have developed rhabdomyolysis with acute renal failure and/or myopathy; patients should be monitored closely. This risk is dose-related and is increased with concurrent use of other lipid lowering medications. Temporarily discontinue for elective major surgery, acute medical or surgical conditions, or in any patient experiencing an acute or serious condition predisposing to renal failure (eg, sepsis, hypotension, trauma, uncontrolled seizures). Based upon current evidence, HMG-CoA reductase inhibitor therapy should be continued in the perioperative period unless risk outweighs cardioprotective benefit. Use caution in patients with renal impairment, inadequately treated hypothyroidism, and those taking other drugs associated with myopathy (eg, colchicine); these patients are predisposed to myopathy. Patients should be instructed to report unexplained muscle pain, tenderness, weakness, or brown urine.

Disease-related concerns:

- Hepatic impairment and/or ethanol use: Use with caution in patients who consume large amounts of ethanol or have a history of liver disease. Use is contraindicated with active liver disease and with unexplained transaminase elevations.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors (see drug interactions); consider alternative agents that avoid or lessen potential for CYP-mediated interactions.

Special Populations:

- Elderly: Use with caution in patients with advanced age, these patients are predisposed to myopathy.

- Pediatrics: Safety and efficacy have not been established in patients <10 years of age or premenarcheal girls.

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy.

- Liver function tests: Must be monitored by periodic laboratory assessment.

Geriatric ConsiderationsEffective and well tolerated in the elderly. The definition of and, therefore, when to treat hyperlipidemia in the elderly is a controversial issue. The National Cholesterol Education Program recommends that all adults maintain a plasma cholesterol <160 mg/dL. In elderly with one additional risk factor, goal LDL would be <130 mg/dL. It is the authors' belief that pharmacologic treatment be reserved for those who are unable to obtain a desirable plasma cholesterol concentration by diet alone and for whom the benefits of treatment are believed to outweigh the potential adverse effects, drug interactions, and cost of treatment.

Pregnancy Risk FactorX

Pregnancy ConsiderationsCholesterol biosynthesis may be important in fetal development. Contraindicated in pregnancy. Administer to women of childbearing potential only when conception is highly unlikely and patients have been informed of potential hazards. If pregnancy occurs during treatment, discontinue simvastatin immediately.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsExcretion in breast milk is unknown, but would be expected; other medications in this class are excreted in human milk. Breast-feeding is contraindicated.

Adverse Reactions

1% to 10%:

Gastrointestinal: Constipation (2%), flatulence (1% to 2%), dyspepsia (1%)

Hepatic: Transaminases increased (>3x ULN; 1%)

Neuromuscular & skeletal: CPK elevation (>3x normal on one or more occasions; 5%)

Respiratory: Upper respiratory infection (2%)

<1%: Abdominal pain, diarrhea, dizziness, fatigue, headache, insomnia, nausea, pruritus, thrombocytopenia, vertigo, weakness

Postmarketing and/or case reports: Depression, dermatomyositis, hypotension, lichen planus, muscle pain, muscle tenderness, muscle weakness, myopathy, photosensitivity

Additional class-related events or case reports (not necessarily reported with simvastatin therapy): Alopecia, alkaline phosphatase increased, alteration in taste, alopecia, anaphylaxis, angioedema, anorexia, anxiety, arthralgia, arthritis, bilirubin increased, cataracts, chills, cholestatic jaundice, cirrhosis, decreased libido, depression, dermatomyositis, dryness of skin/mucous membranes, dyspnea, eosinophilia, erectile dysfunction/impotence, erythema multiforme, facial paresis, fatty liver, fever, flushing, fulminant hepatic necrosis, gynecomastia, hemolytic anemia, hepatic failure, hepatitis, hepatoma, hyperbilirubinemia, hypersensitivity reaction, impaired extraocular muscle movement, increased alkaline phosphatase, increased CPK (>10x normal), increased ESR, increased GGT, leukopenia, malaise, memory loss, myopathy, nail changes, nodules, ophthalmoplegia, pancreatitis, paresthesia, peripheral nerve palsy, peripheral neuropathy, photosensitivity, polymyalgia rheumatica, positive ANA, pruritus, psychic disturbance, purpura, rash, renal failure (secondary to rhabdomyolysis), rhabdomyolysis, skin discoloration, Stevens-Johnson syndrome, systemic lupus erythematosus-like syndrome, thrombocytopenia, thyroid dysfunction, toxic epidermal necrolysis, transaminases increased, tremor, urticaria, vasculitis, vertigo, vomiting

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP2C8 (weak), 2C9 (weak), 2D6 (weak)

Drug Interactions

Amiodarone: May decrease the metabolism of HMG-CoA Reductase Inhibitors. Management: Dose of HMG-CoA reductase inhibitor may need to be reduced (e.g., simvastatin prescribing information recommends not exceeding 20 mg/day during concurrent therapy). *Risk D: Consider*

therapy modification

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Bosentan: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Colchicine: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Colchicine may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CycloSPORINE: May increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Danazol: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

DAPTOmycin: HMG-CoA Reductase Inhibitors may enhance the adverse/toxic effect of DAPTOmycin. Specifically, the risk of skeletal muscle toxicity may be increased. Management: Consider temporarily stopping HMG-CoA reductase inhibitor therapy prior to daptomycin. If used together, regular (i.e., at least weekly) monitoring of CPK concentrations is recommended. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Etravirine: May decrease the serum concentration of HMG-CoA Reductase Inhibitors. This applies to atorvastatin, lovastatin and simvastatin. Conversely, levels of fluvastatin may be increased. Management: Dose adjustment of the HMG-CoA reductase inhibitor may be warranted. No interaction is expected with rosuvastatin or pravastatin. *Risk C: Monitor therapy*

Fenofibrate: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Fenofibric Acid: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Gemfibrozil: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Gemfibrozil may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Grapefruit Juice: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Imatinib: May decrease the metabolism of Simvastatin. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Niacin: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Niacinamide: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Protease Inhibitors: May increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. *Risk D: Consider therapy modification*

Ranolazine: May increase the serum concentration of Simvastatin. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Sildenafil: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

St Johns Wort: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): HMG-CoA Reductase Inhibitors may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid excessive ethanol consumption (due to potential hepatic effects).

Food: Simvastatin serum concentration may be increased when taken with grapefruit juice; avoid concurrent intake of large quantities (>1 quart/day). Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice.

Herb/Nutraceutical: St John's wort may decrease simvastatin levels.

Monitoring ParametersCreatine phosphokinase levels due to possibility of myopathy; serum cholesterol (total and fractionated)

Obtain liver function tests prior to initiation, dose, and thereafter when clinically indicated. Patients titrated to the 80 mg dose should be tested prior to initiation and 3 months after initiating the 80 mg dose. Thereafter, periodic monitoring (ie, semiannually) is recommended for the first year of treatment. Patients with elevated transaminase levels should have a second (confirmatory) test and frequent monitoring until values normalize. Discontinue if increase in ALT/AST is persistently >3 times ULN.

Nursing: Physical Assessment/MonitoringUse with caution and monitor closely in presence of impaired liver function. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, other lipid-lowering drugs may increase risk of myopathy or rhabdomyolysis). Assess results of laboratory tests (LFTs, cholesterol profile) prior to treatment and periodically thereafter. Evaluate therapeutic response (reduction in lipid levels) and adverse reactions on a regular basis throughout therapy. Teach patient proper use (as adjunct to diet and exercise program), possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to women of childbearing age unless they are capable of complying with effective contraceptive use. Instruct patient in appropriate contraceptive measures.

Monitoring: Lab TestsCreatine phosphokinase levels due to possibility of myopathy; serum cholesterol (total and fractionated)

Obtain liver function tests prior to initiation, dose, and thereafter when clinically indicated. Patients titrated to the 80 mg dose should be tested prior to initiation and 3 months after initiating the 80 mg dose. Thereafter, periodic monitoring (ie, semiannually) is recommended for the first year of treatment. Patients with elevated transaminase levels should have a second (confirmatory) test and frequent monitoring until values normalize. Discontinue if increase in ALT/AST is persistently >3 times ULN.

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take at same time each day, in the evening with or without food. Follow cholesterol-lowering diet and exercise regimen as prescribed. Avoid excessive grapefruit juice (>1 quart/day) and excessive alcohol while taking this medication. You will have periodic blood tests to assess effectiveness. You may experience mild GI upset (should diminish with use); constipation (increased exercise, fluids, fiber, and fruit may help); or headache, dizziness, insomnia (use caution when driving or engaged in potentially hazardous tasks until response to drug in known). Contact prescriber immediately with persistent muscle or skeletal pain, joint pain, or numbness. Report other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during and for 1 month following therapy. Consult prescriber for appropriate contraceptive measures. This drug may cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 5 mg, 10 mg, 20 mg, 40 mg, 80 mg

  Zocor®: 5 mg, 10 mg, 20 mg, 40 mg, 80 mg

Generic AvailableYes

ManufacturerMerck & Co

Pricing: U.S. (www.drugstore.com)

Tablets (Simvastatin)

  5 mg (30): $17.99

  10 mg (30): $19.99

  20 mg (30): $27.99

  40 mg (30): $27.99

  80 mg (30): $32.99

Tablets (Zocor)

  5 mg (30): $66.99

  10 mg (90): $240.98

  20 mg (30): $139.99

  40 mg (90): $405.99

  80 mg (30): $146.99

Mechanism of ActionSimvastatin is a methylated derivative of lovastatin that acts by competitively inhibiting 3-hydroxy-3-methylglutaryl-coenzyme A (HMG-CoA) reductase, the enzyme that catalyzes the rate-limiting step in cholesterol biosynthesis

Pharmacodynamics/Kinetics

Onset of action: >3 days

  Peak effect: 2 weeks

Absorption: 85%

Protein binding:~95%

Metabolism: Hepatic via CYP3A4; extensive first-pass effect

Bioavailability: <5%

Half-life elimination: Unknown

Time to peak: 1.3-2.4 hours

Excretion: Feces (60%); urine (13%)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness
Mental Health: Effects on Psychiatric TreatmentRhabdomyolysis with acute renal failure has occurred; risk is increased with concurrent use of fluvoxamine nefazodone and verapamil
Cardiovascular Considerations

Primary Prevention: HMG-CoA reductase inhibitors are effective in primary and secondary prevention of cardiovascular events in patients with hyperlipidemia. For primary prevention, a patient's major risk factors (cigarette smoking, hypertension or currently taking antihypertensives, low HDL-C, family history, age, gender) should be evaluated. Patients with multiple risk factors (≥2) require more intensive therapy guided by the calculation of a 10-year absolute CHD risk (eg, the percent probability of having a CHD event in next 10 years). An individual's 10-year absolute CHD risk can be calculated at www.med-decisions.com/cvtool/phys/phys.html. LDL cholesterol goals, therapeutic lifestyle changes, and drug therapy are determined based upon a patient's risk factor profile.

Primary prevention trials show that cholesterol-lowering drugs reduce the risk of major coronary events, coronary death, and cerebrovascular events even in the first 6-12 months of use. The WOSCOP trial suggested a trend towards enhanced survival using pravastatin in their patients (mean LDL-cholesterol of 192 mg/dL and no history of MI). In a recent trial (Sever, 2003), patients with HTN and at least three other risk factors were randomized to 10 mg daily of atorvastatin or placebo. These patients had a total nonfasting cholesterol <250 mg/dL before treatment. LDL-C levels were 132 mg/dL before treatment and fell to an average of 90 mg/dL in the atorvastatin-treated group. There was a significant reduction in stroke, cardiovascular events, and coronary events in the atorvastatin-treated group as compared to the placebo group. There was no difference in mortality between the groups.

HMG-CoA reductase inhibitors decrease C-reactive protein (CRP), an inflammatory marker and an acute phase reactant. Elevated levels of high sensitive CRP (hsCRP), which detects CRP levels as low as 0.175 mg/L, have been shown to be associated with an increased risk of cardiovascular events. Recently, the JUPITER trial demonstrated that the use of rosuvastatin in healthy patients (men ≥50 years and women ≥60 years) without a history of cardiovascular disease with LDL <130 mg/dL and a hsCRP level ≥2 mg/L reduced the risk of major cardiovascular events (eg, nonfatal MI, stroke, death from cardiovascular causes), The number needed to treat over 5 years to prevent 1 cardiovascular event is 25. Current guidelines do not recommend drug treatment for patients with an LDL <130 mg/dL. However, identification of the patient at higher risk of cardiovascular events within this subgroup using hsCRP is now important given that statins may prevent the occurrence of these serious cardiovascular events (Ridker, 2008).

Secondary prevention: Secondary prevention trials indicate that “statin” therapy reduces mortality, major coronary events, coronary artery procedures, and stroke. The Heart Protection Study proved that lowering serum cholesterol levels reduces the rate of major vascular events among high-risk individuals with documented vascular disease (CHD, cerebrovascular, peripheral vascular) or diabetes regardless of initial cholesterol concentrations. PROVE IT is a randomized, double-blind trial evaluating hospitalized patients with acute coronary syndrome to determine the effects of intense LDL-C lowering therapy. Four thousand patients with an LDL-C levels of 106 mg/dL were randomized to pravastatin 40 mg daily or atorvastatin 80 mg daily. After 2 years, the combined cardiovascular endpoint (death, MI, unstable angina requiring hospitalization, revascularization and stroke) was ~26% in the pravastatin patients (median LDL-C 95 mg/dL) and ~22% in the atorvastatin treated patients (median LDL-C 62 mg/dL).

LaRosa and colleagues assessed the efficacy and safety of lowering LDL cholesterol <100 mg/dL in patients with stable coronary heart disease (LaRosa, 2005). Ten thousand and one patients with baseline LDL levels <130 mg/dL were randomized to atorvastatin 10 mg or 80 mg daily and followed for a median of 4.9 years. The primary endpoint was the occurrence of the first major cardiovascular event (death from CVD, MI, resuscitation after cardiac arrest, or stroke). A primary event occurred in 434 patients (8.7%) receiving 80 mg daily (mean LDL 77 mg/dL) and 548 patients (10.9%) receiving 10 mg dose (mean LDL 101 mg/dL) (95% CI, 0.69-0.89; p <0.001). There was no mortality difference between the two treatment groups.

In addition to the ability of HMG-CoA reductase inhibitors to decrease levels of high-sensitivity C-reactive protein (hs-CRP), they also possess pleiotropic properties including improved endothelial function, reduced inflammation at the site of the coronary plaque, inhibition of platelet aggregation, and anticoagulant effects. These nonlipid effects may be beneficial when HMG-CoA reductase inhibitors are introduced early in the management of acute coronary syndromes (de Denus, 2002).

Myopathy: Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years of age), women more frequently than men, small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, drug interactions (use with caution or avoid). The combination of a HMG-CoA reductase inhibitor plus nicotinic acid seems to carry a lower risk of myopathy than does a HMG-CoA reductase inhibitor plus a fibrate. Other medications, when used concurrently, may enhance the risk of myopathy associated with statins; these include drugs that inhibit CYP3A4 isoenzymes (lovastatin, simvastatin, atorvastatin) or CYP2C9 isoenzymes (fluvastatin). HMG-CoA reductase inhibitors may exacerbate exercise-induced skeletal muscle injury. Many experts favor getting a baseline creatine kinase (CK) measurement before initiating therapy (asymptomatic CK elevations are common). Obtain a CK measurement if patient complains of muscle soreness, tenderness, or pain.

Anesthesia and Critical Care Concerns/Other Considerations**Myopathy:** Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years), gender (occurs in women more frequently than men), small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, and drug interactions (use with caution or avoid).

Based on current research, HMG-CoA reductase inhibitors should be continued in the perioperative period. Postoperative discontinuation of statin therapy is associated with an increased risk of cardiac morbidity and mortality.

Sincalide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(SIN ka lide)
U.S. Brand NamesKinevac®
Pharmacologic CategoryDiagnostic Agent
Use: Labeled IndicationsPostevacuation cholecystography; gallbladder bile sampling; stimulate pancreatic secretion for analysis; accelerate the transit of barium through the small bowel
Dosing: Adults

Contraction of gallbladder:

I.V.: 0.02 mcg/kg over 30-60 seconds; may repeat in 15 minutes with a 0.04 mcg/kg dose

Infusion: 0.12 mcg/kg in 100 mL of NS; administer over 50 minutes

I.M.: 0.1 mcg/kg

Pancreatic function: I.V.: 0.02 mcg/kg over 30 minutes

Accelerate barium transit through small bowel:

I.V.: 0.04 mcg/kg over 30-60 seconds; if movement of barium has not occurred in 30 minutes, may repeat dose

Infusion: 0.12 mcg/kg in 30 mL of NS; administer over 30 minutes

Dosing: ElderlyRefer to adult dosing.
Administration: I.V.Administration via infusion may help manage some adverse events or increase GI tolerance.
Administration: I.V. Detail

I.V. push: Administer over 30-60 seconds

I.V. infusion: Administer over 30-50 minutes. For pancreatic testing, administer over 30 minutes beginning after secretin infusion is started.

pH: 6-8

StorageStore unopened vial at 15°C to 30°C (59°F to 86°F). Once reconstituted, store at room temperature for up to 8 hours. Discard any unused portion. If further diluted for infusion, may be kept at room temperature; use within 1 hour.
ReconstitutionAdd 5 mL SWFI to vial. For I.V. infusion, put dose in 30-100 mL NS.
ContraindicationsHypersensitivity to sincalide or any component of the formulation; intestinal obstruction
Warnings/Precautions

Concerns related to adverse effects:

- Obstruction: Some risk of evacuating small gallstones into cystic duct or common bile duct and obstructing flow.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: Use with caution in pregnancy; may induce premature labor (especially if near term) or spontaneous abortion.

Dosage form specific issues:

- Sodium metabisulfite: Solution for injection contains sodium metabisulfite which may cause allergic reactions in some individuals.

Pregnancy Risk FactorB
Pregnancy ConsiderationsFetal harm was not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Because of its effect on smooth muscle, use during pregnancy should be avoided (may cause spontaneous abortion or premature labor). Use during pregnancy only if clearly needed. Should not be administered near term; may induce labor.
LactationExcretion in breast milk unknow/use caution
Adverse Reactions

>10%: Gastrointestional: Abdominal pain (20%), cramps, nausea (20%)

1% to 10%: Central nervous system: Dizziness (2%)

<1%: Diaphoresis, diarrhea, dyspnea, fecal urgency, flushing, headache, hyper-/hypotension, numbness, rash, sneezing, vomiting

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersFor cholecystography, xrays are taken at 5-minute intervals after the injection. For visualization of the cystic duct,

xrays may be required at 1-minute intervals for the first 5 minutes after injection.

Reference RangeGallbladder size: ≥40% reduction considered a satisfactory contraction.

Monitoring: Lab TestsFor cholecystography, xrays are taken at 5-minute intervals after the injection. For visualization of the cystic duct, xrays may be required at 1-minute intervals for the first 5 minutes after injection.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 5 mcg [contains sodium metabisulfitel]

Generic AvailableNo

Mechanism of ActionStimulates contraction of the gallbladder; inhibits gastric emptying by causing pyloric contraction, and increases intestinal motility; stimulates pancreatic secretion; causes smooth muscle contraction

Pharmacodynamics/Kinetics

Onset of action: Contraction of the gallbladder: ~5-15 minutes

Duration: ~1 hour

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsC8-CCK; OP-CCK

Sinecatechins

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(sin e KAT e kins)

U.S. Brand NamesVeregen®

Pharmacologic CategoryImmunomodulator, Topical; Topical Skin Product

Use: Labeled IndicationsTreatment of external genital and perianal warts secondary to *Condylomata acuminata*

Dosing: Adults*Condylomata acuminata:* Topical: Apply a thin layer (~0.5 cm strand) 3 times/day to all external genital and perianal warts until all warts have been cleared (maximum duration: 16 weeks)

Dosing: Renal ImpairmentNo adjustment required.

Dosing: Hepatic ImpairmentNo adjustment required.

Administration: TopicalWash hands before and after application; apply with fingers, leaving a thin layer of ointment; do not wash ointment off affected area after application. Discontinue treatment if the severity of local skin reactions becomes unacceptable. Do not apply internally; do not apply to open wounds; do not apply occlusive dressing. Sexual contact should be avoided while ointment is on skin. For females requiring tampon use during treatment, tampon should be inserted prior to application of ointment to prevent accidental application of ointment into the vagina. May stain clothing or bedding.

StorageStore at 2°C to 8°C (36°F to 46°F) until dispensed; after dispensing, patient may store under refrigeration or up to 25°C (77°F). Do not freeze.

ContraindicationsThere are no contraindications listed in the manufacturer’s labeling.

Warnings/Precautions

Concerns related to adverse effects:

- Skin irritation: Local skin reactions are common, if possible, continue treatment; severe reactions may require treatment interruption or discontinuation.

Disease-related concerns:

- HPV infection: Not intended for the treatment of urethral, intravaginal, cervical, rectal, or intra-anal human papilloma viral disease. Women should continue to undergo regular gynecological examination, including monitoring and screening for cervical dysplasia.

Special populations:

- Immunosuppressed patients: Safety and efficacy have not been established in immunosuppressed patients.

- Pediatrics: Safety and efficacy have not been established in children <18 years of age.

- Women: Severe reactions were reported more commonly in women; it is possible that women are at a higher risk of serious local events (eg, erosion/ulceration, burning, itching, pain).

Other warnings/precautions:

- Appropriate use: For topical use only; ointment is **not** intended for internal use; avoid topical application to open wounds; has been shown to increase the risk of adverse reactions. Avoid exposure of treated area to sun and/or UV-light.

- Duration of therapy: Continue treatment until all warts have been cleared (maximum duration: 16 weeks); the safety and efficacy of treatment lasting >16 weeks have not been established.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women; use only if possible benefit outweighs potential risk to the fetus. Sinecatechins ointment may weaken condoms and diaphragms.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Dermatologic: Erythema (70%), pruritus (69%), edema (45%), vesicular rash (20%)

Local: Burning (67%), pain/discomfort (56%), erosion/ulceration (49%), induration (35%)

1% to 10%:

Dermatologic: Desquamation (5%), rash (1%), scar formation (1%)

Local: Discharge (3%), lymphadenitis (3%), bleeding (2%), reaction (2%), irritation (1%)

Miscellaneous: Phimosis (uncircumcised males; 3%), hypersensitivity (2%)

<1%: Discoloration, dryness, eczema, facial rash, hyperesthesia, necrosis, papules, pelvic pain, perianal infection, pigmentation changes,

staphylococcemia, urethritis, vulvitis

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersRoutine gynecological exams (females)
Nursing: Physical Assessment/MonitoringMonitor therapeutic response and adverse reactions at the beginning and periodically throughout therapy. Assess knowledge/teach appropriate application of this medication.
Patient EducationUse on affected areas as prescribed. Apply thin layer of medication; do not wash off. Wash your hands immediately after application. Avoid contact with eyes, nostrils, or mouth. Women using tampons should insert the tampon prior to application so as not to introduce the ointment into the vagina. Avoid exposure to sunlight. Do not apply to open wounds, vagina, or anal area. Avoid sexual contact. Genital warts are sexually transmitted; you may infect your partner. If you choose to have sexual contact, wash off the ointment carefully before protected contact as the ointment may weaken condoms and vaginal diaphragms. Avoid use of occlusive dressing. You may experience redness, swelling, or itching at the site of application. Report development of open sores or severe reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Ointment, topical:

Veregen®: 15% (15 g)

Generic AvailableNo
Manufacturer

Bradley Pharmaceuticals, Inc

Mechanism of ActionThe mechanism by which sinecatechins ointment aids in the clearance of genital and perianal warts is unknown. Antioxidant properties have been demonstrated *in vitro*; however, the significance of this finding is not known.
Pharmacodynamics/KineticsAbsorption: Topical: Not sufficiently studied; based on limited data, minimal systemic absorption is expected.
Pharmacotherapy PearlsSinecatechins ointment represents the first botanical drug product to be approved by the FDA. The product contains an extract of dried green tea leaves. The active ingredient(s) are not known; however, sinecatechins is a mixture of catechins (85% to 95% by weight) with the major component being (-)-Epigallocatechin gallate (EGCg). Approximately 2.5% of the mixture contains gallic acid, caffeine, and theobromine.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsCatechins; Green Tea Extract; Kunecatechins; Polyphenols; Polyphenon E

Sirolimus

Lexi-Drugs Online

English English

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Rapamune® may be confused with Rapaflo®

Sirolimus may be confused with tacrolimus, temsirolimus

Pronunciation(sir OH li mus)

U.S. Brand NamesRapamune®

Canadian Brand NamesRapamune®

Pharmacologic CategoryImmunosuppressant Agent; mTOR Kinase Inhibitor

Use: Labeled IndicationsProphylaxis of organ rejection in patients receiving renal transplants, in combination with corticosteroids and cyclosporine (cyclosporine may be withdrawn in low-to-moderate immunological risk patients after 2-4 months, in conjunction with an increase in sirolimus dosage; in high-risk patients, use in combination with cyclosporine and corticosteroids is recommended for the first year)

Use: Unlabeled/InvestigationalProphylaxis of organ rejection in heart transplant recipients; immunosuppression in peripheral stem cell/bone marrow transplantation

Dosing: Adults

Low-to-moderate risk renal transplant patients: Oral:

<40 kg: Loading dose: 3 mg/m^2 on day 1, followed by maintenance dosing of 1 mg/m^2 once daily

≥40 kg: Loading dose: 6 mg on day 1; maintenance: 2 mg once daily

High-risk renal transplant patients: Oral: Loading dose: Up to 15 mg on day 1; maintenance: 5 mg/day; obtain trough concentration between days 5-7 and adjust accordingly. Continue concurrent cyclosporine/sirolimus therapy for 1 year following transplantation. Further adjustment of the regimen must be based on clinical status.

Dosage adjustment: Sirolimus dosages should be adjusted to maintain trough concentrations within desired range based on risk and concomitant therapy. Maximum daily dose: 40 mg. Dosage should be adjusted at intervals of 7-14 days to account for the long half-life of sirolimus. In general, dose proportionality may be assumed. New sirolimus dose **equals** current dose **multiplied by** (target concentration/current concentration). **Note:** If large dose increase is required, consider loading dose calculated as:

Loading dose **equals** (new maintenance dose **minus** current maintenance dose) **multiplied by** 3

Maximum dose in 1 day: 40 mg; if required dose is >40 mg (due to loading dose), divide over 2 days. Serum concentrations should not be used as the sole basis for dosage adjustment (monitor clinical signs/symptoms, tissue biopsy, and laboratory parameters).

Maintenance therapy after withdrawal of cyclosporine: Cyclosporine withdrawal is not recommended in high immunological risk patients. Following 2-4 months of combined therapy, withdrawal of cyclosporine may be considered in low-to-moderate risk patients. Cyclosporine should be discontinued over 4-8 weeks, and a necessary increase in the dosage of sirolimus (up to fourfold) should be anticipated due to removal of metabolic inhibition by cyclosporine and to maintain adequate immunosuppressive effects. Dose-adjusted trough target concentrations are typically 16-24 ng/mL for the first year post-transplant and 12-20 ng/mL thereafter (measured by chromatographic methodology).

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Immunosuppression: Children ≥13 years: Oral: Refer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment (in loading or maintenance dose) is necessary in renal impairment. However, adjustment of regimen (including discontinuation of therapy) should be considered when used concurrently with cyclosporine and elevated or increasing serum creatinine is noted.

Dosing: Hepatic Impairment

Loading dose : No adjustment required

Maintenance dose:

Mild-to-moderate hepatic impairment: reduce maintenance dose by ~33%.

Severe hepatic impairment: reduce maintenance dose by ~50%.

Calculations

- Body Mass Index
- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: OralInitial dose should be administered as soon as possible after transplant. Sirolimus should be taken 4 hours after oral cyclosporine (Neoral® or Gengraf®).

Solution: Mix with at least 2 ounces of water or orange juice. No other liquids should be used for dilution. Patient should drink diluted solution immediately. The cup should then be refilled with an additional 4 ounces of water or orange juice, stirred vigorously, and the patient should drink the contents at once.

Tablet: Do not crush, split. or chew.

Dietary ConsiderationsTake consistently, with or without food, to minimize variability of absorption.

Storage

Oral solution: Store under refrigeration, 2°C to 8°C (36°F to 46°F). Protect from light. A slight haze may develop in refrigerated solutions, but the quality of the product is not affected. After opening, solution should be used in 1 month. If necessary, may be stored at temperatures up to 25°C (77°F) for ≤15 days after opening. Product may be stored in amber syringe for a maximum of 24 hours (at room temperature or refrigerated). Solution should be used immediately following dilution.

Tablet: Store at room temperature of 20°C to 25°C (68°F to 77°F). Protect from light.

ContraindicationsHypersensitivity to sirolimus or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Infection: See “Concerns related to adverse effects” below.
- Liver transplants: See “Special populations” below.
- Lung transplants: See “Special populations” below.
- Malignancy: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactic/hypersensitivity reactions: Hypersensitivity reactions, including anaphylactic/anaphylactoid reactions, angioedema, exfoliative dermatitis, and hypersensitivity vasculitis have been reported.
- Angioedema: Has been reported; concurrent use with other drugs known to cause angioedema (eg, ACE inhibitors) may increase risk.
- Infection: **[U.S. Boxed Warning]: Immunosuppressive agents, including sirolimus, increase the risk of infection.** Immune suppression may also increase the risk of opportunistic infections and sepsis. Prophylactic treatment for *Pneumocystis jirovec* pneumonia (PCP) should be administered for 1 year post-transplant; prophylaxis for cytomegalovirus (CMV) should be taken for 3 months in patients at risk for CMV.
- Interstitial lung disease: Cases of interstitial lung disease (eg, pneumonitis, bronchiolitis obliterans organizing pneumonia, pulmonary fibrosis) have been observed (some fatal); risk may be increased with higher trough levels.
- Lymphocele/fluid accumulation: Use has been associated with an increased risk of fluid accumulation and lymphocele. Peripheral edema, lymphedema, and pleural and pericardial effusions (including significant effusions and tamponade) were reported; use with caution in patients in whom fluid accumulation may be poorly tolerated, such as in cardiovascular disease (heart failure or hypertension) and pulmonary disease.
- Malignancy: **[U.S. Boxed Warning]: Immunosuppressive agents, including sirolimus, may be associated with the development of lymphoma.** Immunosuppressant therapy is associated with an increased risk of skin cancer; limit sun and ultraviolet light exposure; use appropriate sun protection.
- Proteinuria: Increased urinary protein excretion has been observed when converting renal transplant patients from calcineurin inhibitors to sirolimus during maintenance therapy. A higher level of proteinuria prior to sirolimus conversion correlates with a higher degree of proteinuria after conversion. In some patients, proteinuria may reach nephrotic levels.
- Renal effects: May increase serum creatinine and decrease GFR.
- Wound dehiscence/healing: May be associated with wound dehiscence and impaired healing; use caution in the perioperative period. Patients with a body mass index (BMI) >30 kg/m^2 are at increased risk for abnormal wound healing.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; a reduction in the maintenance dose is recommended.
- Hyperlipidemia: Use with caution in patients with hyperlipidemia; may increase serum lipids (cholesterol and triglycerides).

Concurrent drug therapy issues:

- Calcineurin inhibitors: Concurrent use with a calcineurin inhibitor (cyclosporine, tacrolimus) may increase the risk of calcineurin inhibitor-induced hemolytic uremic syndrome/thrombotic thrombocytopenic purpura/thrombotic microangiopathy (HUS/TTP/TMA).
- Cyclosporine: Monitor renal function closely when combined with cyclosporine; consider dosage adjustment or discontinue in patients

with increasing serum creatinine. Safety and efficacy of combination therapy with cyclosporine in high-risk patients has not been studied beyond 12 months of treatment; adjustment of immunosuppressive therapy beyond 12 months should be considered based on clinical judgement.

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors and moderate or strong CYP3A4 inducers (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

- Nephrotoxic drugs: Use with caution in patients concurrently taking medications which may alter renal function.

Special populations:

- Liver transplants: **[U.S. Boxed Warning]: Sirolimus is not recommended for use in *de novo* liver transplant patients;** studies indicate an association with an increase risk of hepatic artery thrombosis, graft failure, and increased mortality in these patients when sirolimus is used in combination with cyclosporine and/or tacrolimus.

- Lung transplants: **[U.S. Boxed Warning]: Sirolimus is not recommended for use in *de novo* lung transplant patients.** Cases of bronchial anastomotic dehiscence have been reported in lung transplant patients when sirolimus was used as part of an immunosuppressive regimen; most of these reactions were fatal.

- Pediatrics: Not labeled for use in children <13 years of age, or in adolescent patients <18 years of age considered at high immunological risk.

- Renal transplant: In renal transplant patients, *de novo* use without cyclosporine has been associated with higher rates of acute rejection. Sirolimus may delay recovery of renal function in patients with delayed allograft function.

Pregnancy Risk FactorC

Pregnancy ConsiderationsEmbryotoxicity and fetotoxicity may occur, as evidenced by increased mortality, reduced fetal weights and delayed ossification in animal studies. There are no adequate and well-controlled studies in pregnant women. Effective contraception must be initiated before therapy with sirolimus and continued for 12 weeks after discontinuation.

The National Transplantation Pregnancy Registry (NTPR, Temple University) is a registry for pregnant women taking immunosuppressants following any solid organ transplant. The NTPR encourages reporting of all immunosuppressant exposures during pregnancy in transplant recipients at 877-955-6877.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for adverse reactions in the breast-fed infant, including possible immunosuppression, breast-feeding is not recommended.

Adverse ReactionsIncidence of many adverse effects is dose related.

>20%:

Cardiovascular: Peripheral edema (54% to 64%), hypertension (39% to 49%), edema (16% to 24%), chest pain (16% to 24%)

Central nervous system: Fever (23% to 34%), headache (23% to 34%), pain (24% to 33%), insomnia (13% to 22%)

Dermatologic: Acne (20% to 31%), rash (10% to 20%)

Endocrine & metabolic: Hypertriglyceridemia (38% to 57%), hypercholesterolemia (38% to 46%), hypophosphatemia (15% to 23%), hypokalemia (11% to 21%)

Gastrointestinal: Diarrhea (25% to 42%), constipation (28% to 38%), abdominal pain (28% to 36%), nausea (25% to 36%), vomiting (19% to 25%), dyspepsia (17% to 25%), weight gain (8% to 21%)

Genitourinary: Urinary tract infection (20% to 33%)

Hematologic: Anemia (23% to 37%), thrombocytopenia (13% to 30%)

Neuromuscular & skeletal: Weakness (22% to 40%), arthralgia (25% to 31%), tremor (21% to 31%), back pain (16% to 26%)

Renal: Serum creatinine increased (35% to 40%)

Respiratory: Dyspnea (22% to 30%), upper respiratory infection (20% to 26%), pharyngitis (16% to 21%)

3% to 20%:

Cardiovascular: Atrial fibrillation, CHF, DVT, facial edema, hypervolemia, hypotension, palpitation, peripheral vascular disorder, postural hypotension, syncope, tachycardia, thrombosis, vasodilation, venous thromboembolism

Central nervous system: Chills, malaise, anxiety, confusion, depression, dizziness, emotional lability, hypoesthesia, hypotonia, neuropathy, somnolence

Dermatologic: Dermatitis (fungal), hirsutism, pruritus, skin hypertrophy, dermal ulcer, ecchymosis, cellulitis, skin carcinoma (up to 3%; includes basal cell carcinoma, squamous cell carcinoma, melanoma), wound healing abnormal

Endocrine & metabolic: Cushing's syndrome, diabetes mellitus, glycosuria, acidosis, dehydration, hypercalcemia, hyperglycemia, hyperphosphatemia, hypocalcemia, hypoglycemia, hypomagnesemia, hyponatremia, hyperkalemia (12% to 17%)

Gastrointestinal: Enlarged abdomen, anorexia, dysphagia, eructation, esophagitis, flatulence, gastritis, gastroenteritis, gingivitis, gingival hyperplasia, ileus, mouth ulceration, oral moniliasis, stomatitis, weight loss

Genitourinary: Pelvic pain, scrotal edema, testis disorder, impotence

Hematologic: Leukocytosis, polycythemia, TTP, hemolytic-uremic syndrome, hemorrhage, leukopenia (9% to 15%)

Hepatic: Abnormal liver function tests, alkaline phosphatase increased, ascites, LDH increased, transaminases increased

Local: Thrombophlebitis

Neuromuscular & skeletal: Arthrosis, bone necrosis, CPK increased, leg cramps, myalgia, osteoporosis, tetany, hypertonia, paresthesia

Ocular: Abnormal vision, cataract, conjunctivitis

Otic: Ear pain, deafness, otitis media, tinnitus

Renal: Albuminuria, bladder pain, BUN increased, dysuria, hematuria, hydronephrosis, kidney pain, tubular necrosis, nocturia, oliguria, pyelonephritis, pyuria, nephropathy (toxic), urinary frequency, urinary incontinence, urinary retention

Respiratory: Asthma, atelectasis, bronchitis, cough, epistaxis, hypoxia, lung edema, pleural effusion, pneumonia, pulmonary embolism, rhinitis, sinusitis

Miscellaneous: Abscess, diaphoresis, flu-like syndrome, herpesvirus infection, hernia, infection (including opportunistic), lymphadenopathy, lymphocele, lymphoproliferative disease/lymphoma (1% to 3%), peritonitis, sepsis

Infrequent, postmarketing, and/or case reports: Anaphylactoid reaction, anaphylaxis, anastomotic disruption, angioedema, azoospermia, cytomegalovirus, Epstein-Barr virus, exfoliative dermatitis, fascial dehiscence, hepatic necrosis, hepatotoxicity, hypersensitivity reaction, hypersensitivity vasculitis; interstitial lung disease (dose–related; includes pneumonitis, pulmonary fibrosis, and bronchiolitis obliterans organizing pneumonia [BOOP] with no identified infectious etiology); joint disorders, lymphedema, nephrotic syndrome, neutropenia, pancreatitis, pancytopenia, pericardial effusion, *Pneumocystis* pneumonia, proteinuria, pulmonary hemorrhage, tamponade, tuberculosis, wound dehiscence

Note: Hepatic artery thrombosis and graft failure have been reported in liver transplant patients (not an approved use); bronchial anastomotic dehiscence has been reported in lung transplant patients (not an approved use); and calcineurin inhibitor-induced hemolytic uremic syndrome/thrombotic thrombocytopenic purpura/thrombotic microangiopathy (HUS/TTP/TMA) has been reported with concurrent cyclosporine and/or tacrolimus.

Metabolism/Transport Effects **Substrate** of CYP3A4 (major), P-glycoprotein; **Inhibits** CYP3A4 (weak)

Drug Interactions

ACE Inhibitors: Sirolimus may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Sirolimus. Management: Sirolimus dose reductions of up to 50-90% may be necessary when starting an azole antifungal. Use of sirolimus with the azole antifungals voriconazole and posaconazole is contraindicated. *Risk D: Consider therapy modification*

CycloSPORINE: Sirolimus may enhance the adverse/toxic effect of CycloSPORINE. An increased risk of calcineurin inhibitor-induced hemolytic uremic syndrome/thrombotic thrombocytopenic purpura/thrombotic microangiopathy (HUS/TTP/TMA) has been described. CycloSPORINE may increase the serum concentration of Sirolimus. This is of specific concern with cyclosporine [MODIFIED]. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Sirolimus. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Sirolimus. *Risk D: Consider therapy modification*

Protease Inhibitors: May increase the serum concentration of Sirolimus. *Risk C: Monitor therapy*

Rifampin: May increase the metabolism of Sirolimus. *Risk D: Consider therapy modification*

Tacrolimus: Sirolimus may enhance the adverse/toxic effect of Tacrolimus. An increased risk of calcineurin inhibitor-induced hemolytic uremic syndrome/thrombotic thrombocytopenic purpura/thrombotic microangiopathy (HUS/TTP/TMA) has been described. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Avoid grapefruit juice; may decrease clearance of sirolimus. Ingestion with high-fat meals decreases peak concentrations but increases AUC by 23% to 35%. Sirolimus should be taken consistently either with or without food to minimize variability.

Herb/Nutraceutical: St John's wort may decrease sirolimus levels; avoid concurrent use. Avoid cat's claw, echinacea (have immunostimulant properties; consider therapy modifications). Herbs with hypoglycemic properties may increase the risk of sirolimus-induced hypoglycemia; includes alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle.

Monitoring ParametersMonitor LFTs and CBC during treatment. Monitor sirolimus levels in all patients (especially in pediatric patients, patients ≥13 years of age weighing <40 kg, patients with hepatic impairment, or on concurrent potent inhibitors or inducers of CYP3A4, and/or if cyclosporine dosing is markedly reduced or discontinued), and when changing dosage forms of sirolimus. Also monitor serum cholesterol and triglycerides, blood pressure, serum creatinine, and urinary protein. Serum drug concentrations should be determined 3-4 days after loading doses and 7-14 days after dosage adjustments; however, these concentrations should not be used as the sole basis for dosage adjustment, especially during withdrawal of cyclosporine (monitor clinical signs/symptoms, tissue biopsy, and laboratory parameters). **Note:** Specific ranges will vary with assay methodology (chromatographic or immunoassay) and are not interchangeable.

Reference Range**Note:** Differences in sensitivity and specificity exist between methods of detection (eg, immunoassay vs HPLC); on average, chromatographic methods yield values ~20% lower than (whole blood) immunoassay determinations. Target range may vary based on assay conditions.

Serum trough concentrations (based on HPLC methods):

Concomitant cyclosporine: 4-12 ng/mL

After cyclosporine withdrawal: 16-24 ng/mL for the first year after transplant; after 1 year: 12-20 ng/mL

Note: Trough concentrations vary based on clinical context and use of additional immunosuppressants. The following represents typical ranges.

When combined with tacrolimus and mycophenolate mofetil (MMF) without steroids: 6-8 ng/mL

As a substitute for tacrolimus (starting 4-8 weeks post-transplant), in combination with MMF and steroids: 8-12 ng/mL

Following conversion from tacrolimus to sirolimus >6 months post-transplant due to chronic allograft nephropathy: 4-6 ng/mL

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications. Assess results of laboratory tests at beginning and periodically during therapy, therapeutic effectiveness, and adverse reactions and toxicity. Assess lipid profiles; evaluate the need for medication intervention. Monitor blood pressure, weight, and renal function. Assess for signs of fluid retention and infection. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse reactions to report.

Monitoring: Lab TestsMonitor LFTs and CBC during treatment. Monitor sirolimus levels in all patients (especially in pediatric patients, patients ≥13 years of age weighing <40 kg, patients with hepatic impairment, or on concurrent potent inhibitors or inducers of CYP3A4, and/or if cyclosporine dosing is markedly reduced or discontinued), and when changing dosage forms of sirolimus. Also monitor serum cholesterol and triglycerides, blood pressure, serum creatinine, and urinary protein. Serum drug concentrations should be determined 3-4 days after loading doses and 7-14 days after dosage adjustments; however, these concentrations should not be used as the sole basis for dosage adjustment, especially during withdrawal of cyclosporine (monitor clinical signs/symptoms, tissue biopsy, and laboratory parameters). **Note:** Specific ranges will vary with assay methodology (chromatographic or immunoassay) and are not interchangeable.

Patient EducationDo not alter dose or discontinue without consulting prescriber. Do not ever mix sirolimus solution with anything other than water or orange juice. Do not crush, split, or chew tablets. May be taken with or without food, but should be taken consistently with regard to food (always on an empty stomach or always with food). Avoid grapefruit juice. Consult prescriber about timing of any other prescribed or OTC medications. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You will be susceptible to infection (avoid crowds and exposure to infection). If you have diabetes, monitor glucose levels closely (drug may alter glucose levels). Limit exposure to sunlight by wearing protective clothing or sunscreen. You may experience nausea, vomiting, loss of appetite (small frequent meals, good mouth care, chewing gum, or sucking hard candy may help); constipation (increase exercise, fluids, fruit, or fiber may help); or diarrhea (yogurt or buttermilk); or muscle or back pain (mild analgesic). Inform prescriber of any adverse effects including, but not limited to, unresolved GI problems; respiratory difficulty, cough, infection; persistent fever; skin rash or irritation; headache, insomnia, anxiety, confusion, emotional lability; unusual bleeding; changes in voiding pattern, burning, itching, or pain on urination; persistent bone, joint, or muscle cramping, pain or weakness; chest pain, palpitations, swelling of extremities; weight gain of 3-5 lbs per week; vision changes or hearing; or any other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral:

Rapamune®: 1 mg/mL (60 mL) [contains ethanol 1.5% to 2.5%; packaged with oral syringes and a carrying case]

Tablet:

Rapamune®: 1 mg, 2 mg

Generic AvailableNo

ManufacturerWyeth-Ayerst Laboratories

Pricing: U.S. (www.drugstore.com)

Solution (Rapamune)

1 mg/mL (60): $534.04

Tablets (Rapamune)

1 mg (30): $277.58

2 mg (100): $1812.11

Mechanism of ActionSirolimus inhibits T-lymphocyte activation and proliferation in response to antigenic and cytokine stimulation and inhibits antibody production. Its mechanism differs from other immunosuppressants. Sirolimus binds to FKBP-12, an intracellular protein, to form an immunosuppressive complex which inhibits the regulatory kinase, mTOR (mammalian target of rapamycin). This inhibition suppresses cytokine mediated T-cell proliferation, halting progression from the G1 to the S phase of the cell cycle. It inhibits acute rejection of allografts and prolongs graft survival.

Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: 12 L/kg (range: 4-20 L/kg)

Protein binding: 92%, primarily to albumin

Metabolism: Extensively hepatic via CYP3A4; to 7 major metabolites

Bioavailability: Oral solution: 14%; Oral tablet: 18%

Half-life elimination: Mean: 62 hours (range: 46-78 hours); extended in hepatic impairment (Child-Pugh class A or B) to 113 hours

Time to peak: 1-2 hours

Excretion: Feces (91% due to P-glycoprotein-mediated efflux into gut lumen); urine (2%)

Pharmacotherapy Pearls

Sirolimus tablets and oral solution are not bioequivalent, due to differences in absorption. Clinical equivalence was seen using 2 mg tablet and 2 mg solution. It is not known if higher doses are also clinically equivalent. Monitor sirolimus levels if cages in dosage forms are made.

Sirolimus solution may cause irritation if administered undiluted.

High-risk renal transplant patients are defined (per the manufacturer's labeling) as African-American transplant recipients and/or repeat renal transplant recipients who lost a previous allograft based on an immunologic process and/or patients with high PRA (panel-reactive antibodies; peak PRA level >80%). Individual transplant centers may have differences in their definitions. For example, some centers would consider a PRA >50% to be at higher risk of rejection.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mouth ulceration, oral moniliasis, stomatitis, gingival hyperplasia, gingivitis, and dysphagia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusInsomnia is common; may cause anxiety, confusion, depression, emotional lability, and somnolence

Mental Health: Effects on Psychiatric TreatmentLeukopenia is common; use caution with clozapine and carbamazepine; nefazodone may increase serum levels of sirolimus

Medication Safety Issues

Sound-alike/look-alike issues:

Janumet™ may be confused with Jantoven™

Pronunciation(sit a GLIP tin & met FOR min)

U.S. Brand NamesJanumet™

Pharmacologic CategoryAntidiabetic Agent, Biguanide; Antidiabetic Agent, Dipeptidyl Peptidase IV (DPP-IV) Inhibitor; Hypoglycemic Agent, Oral

Use: Labeled IndicationsManagement of type 2 diabetes mellitus (noninsulin dependent, NIDDM) in patients not adequately controlled on metformin or sitagliptin monotherapy and as an adjunct to diet and exercise

Dosing: Adults**Type 2 diabetes mellitus:** Oral: Initial doses should be based on current dose of sitagliptin and metformin; daily doses should be divided and given twice daily with meals. Maximum: Sitagliptin 100 mg/metformin 2000 mg daily

Patients inadequately controlled on metformin alone: Initial dose: Sitagliptin 100 mg/day plus current dose of metformin. **Note:** Per manufacturer labeling, patients currently receiving metformin 850 mg twice daily should receive an initial dose of sitagliptin 50 mg and metformin 1000 mg twice daily

Patients inadequately controlled on sitagliptin alone: Initial dose: Metformin 1000 mg/day plus sitagliptin 100 mg/day. **Note:** Patients currently receiving a renally adjusted dose of sitagliptin should not be switched to combination product.

Dosing adjustment: Metformin component may be gradually increased up to the maximum dose. Maximum dose: Sitagliptin 100 mg/metformin 2000 mg daily

Dosing: ElderlyRefer to adult dosing. The initial and maintenance dosing should be conservative, due to the potential for decreased renal function (monitor). Do not use in patients ≥80 years of age unless normal renal function has been established.

Dosing: Renal ImpairmentDo not use with renal disease or renal dysfunction (serum creatinine ≥1.5 mg/dL in males or ≥1.4 mg/dL in females or abnormal clearance).

Dosing: Hepatic ImpairmentAvoid metformin; liver disease is a risk factor for the development of lactic acidosis during metformin therapy.

Administration: OralAdminister with meals.

Dietary ConsiderationsShould be taken with meals (to decrease GI upset). Take at the same time each day. Dietary modification based on ADA recommendations is a part of therapy. Monitor for signs and symptoms of vitamin B_{12} and/or folic acid deficiency; supplementation may be required.

StorageStore at 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to sitagliptin, metformin, or any component of the formulation; renal disease or renal dysfunction (serum creatinine ≥1.5 mg/dL in males or ≥1.4 mg/dL in females, or abnormal creatinine clearance which may also result from conditions such as cardiovascular collapse, acute myocardial infarction, and septicemia); acute or chronic metabolic acidosis including diabetic ketoacidosis (with or without coma).

Warnings/Precautions

Boxed warnings:

- Lactic acidosis: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Hypersensitivity reactions: Rare hypersensitivity reactions (including anaphylaxis, angioedema and/or severe dermatologic reactions, such as Stevens-Johnson syndrome) have been reported in postmarketing surveillance; discontinue if signs/symptoms of hypersensitivity reactions occur. Events have generally been noted within the first 3 months of therapy, and may occur with the initial dose.

- Lactic acidosis: **[U.S. Boxed Warning]: Lactic acidosis is a rare, but potentially severe consequence of therapy with metformin.** Lactic acidosis should be suspected in any patient with diabetes receiving metformin with evidence of acidosis but without evidence of ketoacidosis. Discontinue metformin in clinical situations predisposing to hypoxemia, including conditions such as cardiovascular collapse, respiratory failure, acute myocardial infarction, acute congestive heart failure, and septicemia. The risk of accumulation and lactic acidosis increases with the degree of impairment of renal function.

Disease-related concerns:

- Diabetes mellitus (type 1): Not indicated for use in patients with insulin-dependent diabetes mellitus (IDDM) (type 1)

- Heart failure: Use with caution in patients with congestive heart failure requiring pharmacologic management, particularly in patients with unstable acute heart failure; risk of lactic acidosis may be increased secondary to hypoperfusion.

- Hepatic impairment: Avoid metformin use in patients with impaired liver function due to potential for lactic acidosis.

- Renal impairment: Metformin is substantially excreted by the kidney; patients with renal function below the limit of normal for their age should not receive therapy. Use of concomitant medications that may affect renal function (ie, affect tubular secretion) may also affect metformin disposition. Metformin should be withheld in patients with dehydration and/or prerenal azotemia.

- Stress-related states: It may be necessary to discontinue metformin and administer insulin if the patient is exposed to stress (fever, trauma, infection, surgery).

Special populations:

- Elderly: Metformin should not be initiated in patients ≥80 years of age unless normal renal function is confirmed.

- Pediatrics: Safety and efficacy of this combination have not been established in children.

Other warnings/precautions:

- Ethanol use: Instruct patients to avoid excessive acute or chronic ethanol use; ethanol may potentiate metformin's effect on lactate metabolism.

- Iodinated contrast: Metformin therapy should be temporarily discontinued prior to or at the time of intravascular administration of iodinated contrast media (potential for acute alteration in renal function). Metformin should be withheld for 48 hours after the radiologic study and restarted only after renal function has been confirmed as normal.

- Surgical procedures: Therapy should be suspended for any surgical procedures (resume only after normal intake resumed and normal renal function is verified).

Geriatric Considerations Sitagliptin has not been studied exclusively in the elderly. The manufacturer reports that 725 out of 3884 patients in clinical trials were >65 years of age (only 61 were ≥75 years), with no difference in safety or efficacy compared to younger patients. Limited data suggest that metformin's total body clearance may be decreased and AUC and half-life increased in elderly patients; presumably due to decreased renal clearance. Metformin has been well tolerated by the elderly but lower doses and frequent monitoring are recommended. In one study of elderly subjects, its effects could not be distinguished from tolbutamide, except for weight loss. The initial and maintenance dosing should be conservative, due to the potential for decreased renal function. Generally, elderly patients should not be titrated to the maximum dose of metformin. Do not use in patients ≥80 years of age unless normal renal function has been established. How “tightly” an elderly patient's blood glucose should be controlled is controversial; however, a fasting blood sugar of <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well they recognize hypoglycemic or hyperglycemic symptoms, and how to respond to them and their other disease states. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk Factor B

Pregnancy Considerations

Reproduction studies have not been conducted with this combination. Adverse events were not observed in animal studies of the individual agents; therefore, sitagliptin/metformin is classified as pregnancy category B. See individual agents. Health professionals are encouraged to report any prenatal exposure to Janumet™ by contacting Merck’s pregnancy registry (1-800-986-8999).

Lactation

Sitagliptin: Execretion in breast milk unknown/use caution

Metformin: Enters breast milk

Breast-Feeding Considerations See individual agents.

Pregnancy & Lactation, In-Depth

- MetFORMIN in Pregnancy & Lactation
- SitaGLIPtin in Pregnancy & Lactation

Adverse Reactions See individual agents.

Drug Interactions

Cephalexin: May increase the serum concentration of MetFORMIN. *Risk C: Monitor therapy*

Cimetidine: May decrease the excretion of MetFORMIN. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Iodinated Contrast Agents: May enhance the adverse/toxic effect of MetFORMIN. Renal dysfunction that may be caused by iodinated contrast agents may lead to metformin-associated lactic acidosis. *Risk D: Consider therapy modification*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsSee individual agents.
Monitoring ParametersHgb A_{1c} and serum glucose, hematologic parameters (eg, hemoglobin/hematocrit, red blood cell indices); hepatic function, renal function; vitamin B_{12} and folate (if megaloblastic anemia is suspected)
Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Nursing: Physical Assessment/MonitoringSee individual agents.
Monitoring: Lab TestsHgb A_{1c} and serum glucose, hematologic parameters (eg, hemoglobin/hematocrit, red blood cell indices); hepatic function, renal function; vitamin B_{12} and folate (if megaloblastic anemia is suspected)
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Janumet™:

50/500: Sitagliptin 50 mg and metformin hydrochloride 500 mg

50/1000: Sitagliptin 50 mg and metformin hydrochloride 1000 mg

Generic AvailableNo
ManufacturerMerck
Pricing: U.S. (www.drugstore.com)

Tablets (Janumet)

50-500 mg (60): $184.25

50-1000 mg (60): $183.19

Mechanism of ActionSitagliptin inhibits dipeptidyl peptidase IV (DPP-IV) enzymes resulting in prolonged active incretin levels. Incretin hormones [eg, glucagon-like peptide-1 (GLP-1) and glucose-dependent insulinotropic polypeptide (GIP)] regulate glucose homeostasis by increasing insulin synthesis and release from pancreatic beta cells and decreasing glucagon secretion from pancreatic alpha cells. Decreased glucagon secretion results in decreased hepatic glucose production. Under normal physiologic circumstances, incretin hormones are released by the intestine throughout the day and levels are increased in response to a meal; incretin hormones are rapidly inactivated by DPP-IV enzymes.

Metformin decreases hepatic glucose production, decreasing intestinal absorption of glucose, and improves insulin sensitivity (increases peripheral glucose uptake and utilization).

Pharmacodynamics/KineticsSee individual agents.
Related Information

- Diabetes Mellitus Management, Adults

Dental Health: Effects on Dental TreatmentSitagliptin- and metformin-dependent patients with diabetes (noninsulin dependent, Type 2) should be appointed for dental treatment in morning in order to minimize chance of stress-induced hypoglycemia.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness
Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concurrent use with lithium, carbamazepine, valproic acid, and SSRIs may produce additive effects.
Index TermsMetformin and Sitagliptin; Sitagliptin Phosphate and Metformin Hydrochloride

Medication Safety Issues

Sound-alike/look-alike issues:

Januvia™ may be confused with Jantoven™

SitaGLIPtin may be confused with SUMAtriptan

Pronunciation(sit a GLIP tin)
U.S. Brand NamesJanuvia™
Pharmacologic CategoryAntidiabetic Agent, Dipeptidyl Peptidase IV (DPP-IV) Inhibitor
Use: Labeled Indications

U.S. labeling: Management of type 2 diabetes mellitus (noninsulin dependent, NIDDM) as an adjunct to diet and exercise as monotherapy or in combination therapy with other antidiabetic agents

Canadian labeling: Management of NIDDM in combination with metformin therapy, diet, and exercise. **Note:** Use as monotherapy is not approved in Canadian labeling.

Dosing: Adults **Type 2 diabetes:** Oral: 100 mg once daily

Concomitant use with sulfonylureas: Reduced dose of sulfonylurea may be needed.

Dosing: Renal Impairment

Cl_{cr} ≥50 mL/minute: No adjustment required

Cl_{cr} ≥30 to <50 mL/minute: 50 mg once daily

S_{cr}: Males: >1.7 to ≤3.0 mg/dL; Females: >1.5 to ≤2.5 mg/dL: 50 mg once daily

Cl_{cr}<30 mL/minute: 25 mg once daily

S_{cr}: Males: >3.0 mg/dL; Females: >2.5 mg/dL: 25 mg once daily

ESRD requiring hemodialysis or peritoneal dialysis: 25 mg once daily; administered without regard to timing of hemodialysis

Dosing: Hepatic Impairment

Mild-to-moderate impairment (Child-Pugh score 7-9): No dosage adjustment required

Severe impairment (Child-Pugh score >9): Not studied

Calculations

- Creatinine Clearance: Adults

Administration: Oral May be administered with or without food.
Dietary Considerations May be taken with or without food.
Storage Store at 20°C to 25°C (68°F to 77°F).
Contraindications Serious hypersensitivity (eg, anaphylaxis, angioedema) or any component of the formulation; type 1 diabetes mellitus (insulin dependent, IDDM), diabetic ketoacidosis
Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: Rare hypersensitivity reactions, including anaphylaxis, angioedema, and/or severe dermatologic reactions such as Stevens-Johnson syndrome, have been reported in postmarketing surveillance; discontinue if signs/symptoms of hypersensitivity reactions occur. Events have generally been noted within the first 3 months of therapy, and may occur with the initial dose.

Disease-related concerns:

- Renal impairment: Use with caution in patients with moderate-to-severe renal dysfunction and end-stage renal disease (ESRD) requiring hemodialysis or peritoneal dialysis; dosing adjustment required.

Concurrent drug therapy issues:

- Sulfonylureas: Use caution when used in conjunction with sulfonylureas; risk of hypoglycemia is increased. Monitor blood glucose closely; dosage adjustments of the sulfonylurea may be necessary.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <18 years of age.

Geriatric ConsiderationsSitagliptin has not been studied exclusively in the elderly. The manufacturer reports that 725 out of 3884 patients in clinical trials were >65 years (only 61 were age 75 years and older), with no difference in safety or efficacy compared to younger patients. How “tightly” a geriatric patient's blood glucose should be controlled is controversial; however, a fasting blood sugar of <150 mg/dL is now an acceptable endpoint. Such a decision should be based on the patient's functional and cognitive status, how well they recognize hypoglycemic or hyperglycemic symptoms, and how to respond to them and their other disease states. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal reproduction studies; therefore, sitagliptan is classified as pregnancy category B. There are no adequate and well controlled studies in pregnant women. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Diabetes can also be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the mother and the fetus. Until additional safety and efficacy data are obtained, the use of oral agents is generally not recommended as routine management of GDM or type 2 diabetes mellitus during pregnancy. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy. Health professionals are encouraged to report any prenatal exposure to sitagliptin by contacting Merck’s pregnancy registry (1-800-986-8999).

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if sitagliptin is excreted in breast milk. The manufacturer recommends that caution be used if administered to breast-feeding women.

Pregnancy & Lactation, In-Depth

- SitaGLIPtin in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Gastrointestinal: Diarrhea (3%), abdominal pain (2%), nausea (1%)

Respiratory: Nasopharyngitis (5%)

Postmarketing and/or case reports: Anaphylaxis, angioedema, exfoliative dermatitis, hypoglycemia (risk increased in conjunction with sulfonylureas), hypersensitivity, liver enzymes increased, rash, serum creatinine increased, Stevens-Johnson syndrome, urticaria, white blood cells increased

Metabolism/Transport Effects**Substrate** (minor) of CYP2C8, 3A4

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersHgb A_{1C} and serum glucose; renal function prior to initiation and periodically during treatment.

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Blood pressure: <130/80 mm Hg

Nursing: Physical Assessment/MonitoringUse with caution in presence of moderate-to-severe renal disease. Assess for potential adverse interactions with any other prescriptions, OTC medications, or herbal products patient may be taking (eg, sulfonylureas or anything else that may affect glucose levels). Evaluate results of laboratory tests and renal function prior to beginning treatment and regularly thereafter. Refer patient to diabetic educator for diabetic education if necessary. Teach patient correct use, possible side effects/appropriate interventions, and adverse symptoms to report (rare hypersensitivity reactions have been reported).

Monitoring: Lab TestsHgb A_{1C} and serum glucose; renal function prior to initiation and periodically during treatment.

Patient EducationThis medication will not cure diabetes and may be prescribed in conjunction with another antidiabetic medication. Do not take any new prescriptions, OTC medications, or herbal products during therapy unless approved by prescriber. Take as directed; may be taken with or without food. It is important to follow dietary and lifestyle recommendations and glucose monitoring instructions of prescriber or diabetic educator. You will be instructed in signs of hyper- or hypoglycemia; always carry a source of glucose with you in event of hypoglycemia. You may experience mild headache, upper respiratory infection, stuffy or runny nose, sore throat, or diarrhea when beginning treatment. Notify prescriber immediately of any hypersensitivity reaction (difficulty breathing, chest pain, difficulty swallowing, swelling of mouth, blistering or erosion of skin, or oral membranes); or other persistent and unresolved adverse effects. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Januvia™: 25 mg, 50 mg, 100 mg

Generic AvailableNo

ManufacturerMerck

Pricing: U.S. (www.drugstore.com)

Tablets (Januvia)

100 mg (30): $181.09

Mechanism of ActionSitagliptin inhibits dipeptidyl peptidase IV (DPP-IV) enzyme resulting in prolonged active incretin levels. Incretin hormones (eg, glucagon-like peptide-1 [GLP-1] and glucose-dependent insulinotropic polypeptide [GIP]) regulate glucose homeostasis by increasing insulin synthesis and release from pancreatic beta cells and decreasing glucagon secretion from pancreatic alpha cells. Decreased glucagon secretion results in decreased hepatic glucose production. Under normal physiologic circumstances, incretin hormones are released by the intestine throughout the day and levels are increased in response to a meal; incretin hormones are rapidly inactivated by the DPP-IV enzyme.

Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: ~198 L

Protein binding: 38%

Metabolism: Not extensively metabolized; minor metabolism via CYP3A4 and 2C8 to metabolites (inactive) suggested by *in vitro* studies

Bioavailability: ~87%

Half-life elimination: 12 hours

Time to peak, plasma: 1-4 hours

Excretion: Urine 87% (79% as unchanged drug, 16% as metabolites); feces 13%

Sitaxsentan

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(sye TACKS en tan)
Canadian Brand NamesThelin™
Pharmacologic CategoryEndothelin Antagonist; Vasodilator
Use: Labeled IndicationsTreatment of primary pulmonary arterial hypertension (PAH) or pulmonary hypertension secondary to connective tissue disease, in World Health Organization (WHO) class III patients unresponsive to conventional therapy; treatment of PAH in WHO class II patients who are unresponsive to conventional therapy and have no alternative treatment options
Dosing: Adults **Pulmonary arterial hypertension:** Oral: 100 mg once daily. (**Note:** Doses above 100 mg/day are not recommended; higher doses have not been shown to provide additional benefit and may increase risk of hepatic toxicity).
Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNo adjustment required.
Dosing: Adjustment for ToxicityDosage modifications based on transaminase elevation:

AST/ALT >3 but ≤8 times ULN: Confirm with additional test; if confirmed, interrupt treatment. Monitor transaminase levels at least every 2 weeks until levels are <3 times ULN. Reinitiate treatment as appropriate with return to pretreatment values and with more frequent checks of transaminase levels (3 days after restarting therapy and every 2 weeks thereafter).

AST/ALT >8 times ULN: Stop treatment and do not reintroduce.

Note: If any elevation, regardless of degree, is accompanied by clinical symptoms of hepatic injury (unusual fatigue, nausea, vomiting, abdominal pain, fever, or jaundice) or a serum bilirubin >2 times ULN, treatment should be stopped and not reintroduced.

Administration: OralAdminister with or without food.
Dietary ConsiderationsMay be taken without regard to meals.
StorageStore at 15°C to 25°C (59°F to 77°F). Protect from moisture.
RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to sitaxsentan or any component of the formulation; concurrent use with cyclosporine; prior hepatic impairment (mild-to-severe, Child-Pugh class A-C); elevated AST/ALT >3 times upper limit of normal (ULN); breast-feeding; pregnancy
Warnings/Precautions

Boxed warnings:

- Cyclosporine: See “Concurrent drug therapy issues” below.
- Hepatic toxicity: See “Concerns related to adverse effects” below.
- Warfarin: See “Concurrent drug therapy issues” below.

Concerns related to adverse effects:

- Hematologic changes: A reduction in hematocrit (Hct)/hemoglobin (Hgb) may be observed within the first few weeks of therapy with subsequent stabilization of levels observed by week four of therapy. Hgb reductions >15% have been observed in some patients. Obtain baseline Hgb level. After initiating therapy, measure Hgb at 1 month, 3 months, and every 3 months thereafter. Patients with significant decreases in Hgb require evaluation for the cause and appropriate treatment.
- Hepatic toxicity: **[Canadian Boxed Warning]: Use has been associated with reversible, dose-dependent transaminase (ALT or AST) elevations (observe with doses ≥300 mg/day while incidence less than placebo with 100 mg/day). Increased bilirubin levels may be observed as well. Mild-to-severe hepatitis (including one fatality) has been reported with use.** Obtain transaminase levels prior to starting therapy and monthly thereafter for the duration of treatment. Interrupt therapy if transaminases >3 times ULN. Permanently discontinue therapy with transaminase levels >8 times ULN; elevated transaminases accompanied by symptoms of hepatic injury (unusual fatigue, jaundice, nausea, vomiting, abdominal pain, and/or fever); or elevated serum bilirubin >2 times ULN.

Disease-related concerns:

- Cardiovascular disease: Initiate therapy with caution in patients with systemic systolic blood pressure (SBP) <85 mm Hg.

Concurrent drug therapy issues:

- Cyclosporine: **[Canadian Boxed Warning]: Concurrent use of sitaxsentan with cyclosporine is contraindicated.**
- Warfarin: **[Canadian Boxed Warning]: A reduction in warfarin dosing may be necessary when used concurrently with sitaxsentan due to increased risk of prolonged PT/INR.**

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <18 years of age.

Geriatric ConsiderationsNo specific data for use in elderly to date. Follow adult dosing and monitor LFTs (see Montoring Parameters).

Pregnancy ConsiderationsThe use of sitaxsentan is contraindicated in pregnancy. Based on animal studies, sitaxsentan is likely to produce major birth defects if used by pregnant women. Pregnancy must be excluded prior to initiation of therapy and follow-up pregnancy tests should be obtained monthly. Reliable contraceptive methods should be utilized during therapy.

LactationExcretion into breast milk unknown/contraindicated

Adverse Reactions

>10%: Central nervous system: Headache (15%)

1% to 10%:

Cardiovascular: Peripheral edema (9%), flushing (4%)

Central nervous system: Fatigue (3%), insomnia (2%)

Endocrine & metabolic: Menorrhagia (1%)

Gastrointestinal: Nausea (7%), constipation (3%), vomiting (3%), dyspepsia (2%), upper abdominal pain (2%), bleeding gums (1%)

Genitourinary: Vaginal hemorrhage (1%)

Hematologic: Hemoglobin decreased by >15% (dose related; 7%), INR increased (6%), PT prolonged (5%), hematoma (1%), hematocrit decreased (dose related)

Hepatic: ALT increased (2% to 3%, occurrence less then placebo), AST increased (2% to 3%, occurrence less then placebo)

Neuromuscular & skeletal: Muscle cramping (2%)

Renal: Hematuria (1%)

Respiratory: Nasal congestion (9%), epistaxis (up to 8%), hemoptysis (2%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Abortifacient, agitation, angina pectoris, anorexia, aPTT prolonged, ascites, ataxia, atrial flutter, AV block (first degree), bicarbonate decreased, bradycardia, cardiac murmur, CHF, cholelithiasis, cholecystitis, cholestasis, colitis, conjunctival hemorrhage, conjunctivitis, creatine phosphokinase increased, creatinine increased, deafness, ear pain, ECG QT prolonged, eosinophilia, eye edema, gastrointestinal hemorrhage, gingivitis, goiter, hepatic failure, hepatitis, hepatomegaly, hyperbilirubinemia, hypercholesterolemia, hyperglycemia, hyper-/hypokalemia, hyper-/hypotension, hypernatremia, hypersensitivity, hypocalcemia, hypoxia, ischemic stroke, jaundice, lacrimation increased, lactate dehydrogenase increased, lactic acidosis, leukopenia, lymphoma, MI, migraine, multiorgan failure, myeloproliferative disorder, orthostatic hypotension, pancreatitis acute, pancytopenia, pericardial effusion, peptic ulcer, phosphorous increased, photophobia, polydipsia, pulmonary embolism, rash, respiratory failure, seizure, stomatitis, supraventricular tachycardia, systemic lupus erythematosus, tachycardia, tongue discoloration, ventricular tachycardia, thrombocytopenia, tinnitus, tremor, ventricular premature contraction, vertigo, visual disturbance, xerostomia

Metabolism/Transport Effects**Substrate** of CYP3A4/5 (minor), 2C9 (minor); **Inhibits** CYP2C9 (strong), 2C19 (strong), 3A4/5 (moderate)

Drug Interactions

CycloSPORINE: May increase the serum concentration of Sitaxsentan. *Risk X: Avoid combination*

CYP2C19 Substrates: CYP2C19 Inhibitors (Strong) may decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Warfarin: Sitaxsentan may increase the serum concentration of Warfarin. *Risk D: Consider therapy modification*

Monitoring ParametersSerum transaminase (AST and ALT) and bilirubin should be determined prior to the initiation of therapy and at monthly intervals thereafter. Monitor for clinical signs and symptoms of liver injury (eg, abdominal pain, fatigue, fever, jaundice, nausea, vomiting). Interrupt therapy if transaminases >3 times ULN and ≤8 times ULN. Monitor levels every 2 weeks until they are <3 times ULN. Therapy may be resumed with more frequent monitoring of levels. Discontinue therapy with transaminase levels >8 times ULN and in patients with elevated transaminases with accompanying symptoms of hepatic injury, or bilirubin >2 times ULN.

Hemoglobin and hematocrit should be measured at baseline, 1 month, 3 months, and every 3 months thereafter (levels generally stabilize within 4 weeks from the initiation of therapy). Obtain baseline blood pressure and initiate therapy with caution with SBP <85 mm Hg. A woman of childbearing potential must have a negative pregnancy test prior to the initiation of therapy and monthly thereafter.

Nursing: Physical Assessment/MonitoringMonitor blood pressure at the beginning of therapy and periodically thereafter. Monitor laboratory tests, adverse reactions, and therapeutic response. Assess other prescription and OTC medications the patient may be taking to avoid duplications and interactions. Assess knowledge/teach patient appropriate use, side effects, the need for careful contraception, and symptoms to report.

Monitoring: Lab TestsSerum transaminase (AST and ALT) and bilirubin should be determined prior to the initiation of therapy and at monthly intervals thereafter. Monitor for clinical signs and symptoms of liver injury (eg, abdominal pain, fatigue, fever, jaundice, nausea, vomiting). Interrupt therapy if transaminases >3 times ULN and ≤8 times ULN. Monitor levels every 2 weeks until they are <3 times ULN. Therapy may be resumed with more frequent monitoring of levels. Discontinue therapy with transaminase levels >8 times ULN and in patients with elevated transaminases with accompanying symptoms of hepatic injury, or bilirubin >2 times ULN.

Hemoglobin and hematocrit should be measured at baseline, 1 month, 3 months, and every 3 months thereafter (levels generally stabilize within 4 weeks from the initiation of therapy). Obtain baseline blood pressure and initiate therapy with caution with SBP <85 mm Hg. A woman of childbearing potential must have a negative pregnancy test prior to the initiation of therapy and monthly thereafter.

Patient EducationMay cause headache, nausea, nasal congestion, nose bleeds, or peripheral edema. Report increase in shortness of breath, unexplained weight gain >3 pounds per week, unusual fatigue, jaundice, nausea, vomiting, abdominal pain, or fever. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. If menses is missed, contact prescriber immediately. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. CAN = Canadian brand name

Tablet:

Thelin™ [CAN]: 100 mg [contains lactose; not available in U.S.]

Generic AvailableNo

ManufacturerEncysive Canada Inc

Mechanism of ActionSitaxsentan is a selective antagonist of the A subtype of endothelin-1 receptors (ETA) located in pulmonary smooth muscle. Stimulation of these receptors by endogenous endothelin-1 causes vasoconstriction, thus worsening symptoms of PAH. Sitaxsentan exhibits 6500-fold greater selectivity for the ET_A over the ET_B subtype, the latter of which predominates on vascular endothelial cells. Thus, preferential antagonism of ET_A reduces vasoconstriction, without compromising the vasodilatory/antiproliferative actions mediated through endothelin-1 binding to the ET_B subtype.

Pharmacodynamics/Kinetics

Absorption: Rapid

Protein binding: >99% (primarily albumin)

Metabolism: Hepatic via CYP2C9 and 3A4 into 1,3 keto and 1-keto-2-hydroxy metabolites (metabolites have minimal activity on ET_A receptor, not active on ET_B receptor)

Bioavailability: >90%

Half-life elimination: 10 hours

Time to peak, plasma: 1-4 hours

Excretion: Urine (50% to 60%, 1% as unchanged drug); feces

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Bleeding gums has been reported.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Index TermsSitaxsentan Sodium

Smallpox Vaccine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(SMAL poks vak SEEN)

U.S. Brand NamesACAM2000™

Pharmacologic CategoryVaccine

Use: Labeled IndicationsActive immunization against vaccinia virus, the causative agent of smallpox in persons determined to be at risk for smallpox infection. The ACIP recommends vaccination of laboratory workers at risk of exposure from cultures or contaminated animals which may be a source of vaccinia or related Orthopoxviruses capable of causing infections in humans (monkeypox, cowpox, or variola). The ACIP also recommends that consideration be given for vaccination in healthcare workers having contact with clinical specimens, contaminated material, or patients receiving vaccinia or recombinant vaccinia viruses. ACIP recommends revaccination every 10 years. The Armed Forces recommend vaccination of certain personnel categories. Recommendations for use in response to bioterrorism are regularly updated by the CDC, and may be found at www.cdc.gov.

Dosing: AdultsNot for I.M., I.V., or SubQ injection: Vaccination by scarification (multiple-puncture technique) only: **Note:** A trace of blood should appear at vaccination site after 15-20 seconds; if no trace of blood is visible, an additional 3 insertions should be made using the same needle, without reinserting the needle into the vaccine bottle.

ACAM2000™:

Primary vaccination and revaccination: Use a single drop of vaccine suspension and 15 needle punctures (using the same bifurcated needle) into the superficial skin

Note: According to the manufacturer, revaccination is recommended every 3 years for patients at a continued high risk for smallpox infection. This recommendation differs from the current ACIP recommendations for routine nonemergency smallpox revaccination. Additional information can be obtained from the Department of Defense and the CDC.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥12 months in emergency conditions only: Refer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment required.

Administration: OtherVaccination should only be performed by healthcare providers trained in the safe and efficacious administration of the smallpox vaccine via the percutaneous route. Using a bifurcated needle, 1 drop of vaccine is introduced into the superficial layers of the skin using a multiple-puncture technique. The skin over the insertion of the deltoid muscle or the posterior aspect of the arm over the triceps are the preferred sites for vaccination.

A single-use bifurcated needle should be dipped carefully into the reconstituted vaccine (following removal of rubber stopper). Visually confirm that the needle picks up a drop of vaccine solution. Deposit the drop of vaccine onto clean, dry skin at the vaccination site. If alcohol is used to clean the skin, allow site to dry completely prior to administration to prevent the inactivation of the vaccine by the alcohol. Holding the bifurcated needle perpendicular to the skin, punctures are to be made rapidly within a diameter of about 5 mm into the superficial skin of the vaccination site. The puncture strokes should be vigorous enough to allow a trace of blood to appear after approximately 15-20 seconds. Wipe off any remaining vaccine with dry sterile gauze. Dispose of all materials in a biohazard waste container. All materials must be burned, boiled, or autoclaved. If no evidence of vaccine take is apparent after 7 days, the individual may be vaccinated again.

To prevent transmission of the virus, avoid scratching the vaccination site and cover with gauze; cover gauze with a semipermeable barrier or clothing. Ointment or salves should not be applied to the vaccination site. Good handwashing prevents inadvertent inoculation. Vaccinees should change bandages away from others and launder their own linens separately to prevent transmission.

StorageStore at -15°C to -25°C (5°F to -13°F); prior to reconstitution, may be stored at 2°C to 8°C (36°F to 46°F) for up to 18 months. Following reconstitution, stable for 6 to 8 hours at room temperature of 20°C to 25°C (68°F to 77°F) or for up to 30 days when refrigerated at 2°C to 8°C (36°F to 46°F). The provided diluent should be stored at room temperature of 15°C to 30°C (59°F to 86°F).

ReconstitutionBring to room temperature prior to reconstitution. Using the syringe provided, inject 0.3 mL of provided diluent into the vaccine vial. Swirl gently until the solution becomes a slightly hazy, colorless to straw-colored liquid free from particulate matter; avoid contact between the solution and the rubber stopper.

RestrictionsThe smallpox vaccine is not available for general public use. All supplies are currently owned by the federal government for inclusion in the Strategic National Stockpile. In October 2002, the FDA approved the licensing of the stockpile of smallpox vaccine. This approval allows the vaccine to be distributed and administered in the event of a smallpox attack. The bulk of current supplies have been designated for use by the U.S. military. Additionally, laboratory workers who may be at risk of exposure may require vaccination. Bioterrorism experts have proposed immunization of first responders (including police, fire, and emergency workers), but these plans may not be implemented until additional stocks of vaccine are licensed.

ACAM2000™ is subject to a Risk Minimization Action Plan (RiskMAP) which includes mandatory adverse event reporting, risk management evaluation, and education for both healthcare providers administering the vaccine and patients. Patients who receive the vaccine must be given an FDA-approved medication guide which is available at http://www.fda.gov/cber/label/acam2000pi.pdf.

ContraindicationsThere are no absolute contraindications regarding vaccination of individuals with a high-risk exposure to smallpox. The decision to vaccinate in an emergency situation must be based on a careful analysis of potential benefits and possible risks.

For non-emergent use: Hypersensitivity to the vaccine or any component of the formulation; patients with a history of eczema or patients whose household contacts have acute or chronic exfoliative skin conditions (atopic dermatitis, eczema, burns, impetigo, Varicella zoster, or wounds); history of Darier disease (or if household contact has active disease); immunosuppressed patients and their household contacts, including patients with congenital or acquired immune deficiencies (including HIV, agammaglobulinemia, leukemia, lymphoma, neoplastic disease of the bone marrow or lymphatic system), patients receiving radiation, immunosuppressive drugs, or systemic corticosteroids ≥20 mg/day or ≥2 mg/kg body weight of prednisone for >2 weeks; patients using ocular steroid medications; moderate to severe intercurrent illness; cardiac disease, including previous MI, angina, CHF, cardiomyopathy, chest pain, or shortness of breath requiring medical therapy; pregnancy or suspected pregnancy (including household contacts of pregnant women); breast-feeding.

Warnings/Precautions

Boxed warnings:

- Altered immunocompetence: See “Special populations” below.
- Cardiovascular disease: See “Disease-related concerns” below.
- Eczema: See “Disease-related concerns” below.
- Encephalitis: See “Concerns related to adverse effects” below.
- Myopericarditis: See “Concerns related to adverse effects” below.
- Ocular complications: See “Concerns related to adverse effects” below.
- Pediatrics: See “Special populations” below.
- Pregnancy: See “Special populations” below.
- Skin and systemic reactions: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Encephalitis: **[U.S. Boxed Warning]: Following vaccination, encephalitis, encephalomyelitis, and encephalopathy have been observed.**
- Myopericarditis: **[U.S. Boxed Warning]: Following vaccination, acute myopericarditis and/or pericarditis have been observed.**
- Ocular complications: [**U.S. Boxed Warning]: Following vaccination, accidental infection of the eye may occur resulting in keratitis, corneal scarring, and blindness. Patients using topical steroids may be at an increased risk for ocular vaccinia.**
- Skin and systemic reactions: **[U.S. Boxed Warning]: Following vaccination, progressive vaccinia, generalized vaccinia, severe vaccinial skin infections, and erythema multiforme major (including Stevens-Johnson syndrome) have been observed.**

Disease-related concerns:

- Cardiovascular disease: **[U.S. Boxed Warning]: Patients with cardiovascular disease and patients at risk for cardiovascular disease (eg, hypertension, hyperlipidemia, diabetes, and family history) may be at an increased risk for severe adverse reactions;** these patients should not be vaccinated in nonemergency situations.
- Eczema: **[U.S. Boxed Warning]: Patients with eczema of any type/severity may be at an increased risk for severe skin infections;** these patients should not be vaccinated in nonemergency situations.

Special populations:

- Altered immunocompetence: **[U.S. Boxed Warning]: Immunocompromised patients may be at an increased risk for progressive vaccinia;** these patients should not be vaccinated in nonemergency situations.
- Elderly: Safety and efficacy have not been established in patients ≥65 years of age.
- Pediatrics: **[U.S. Boxed Warning]: Infants <12 months of age may be at increased risk for severe adverse reactions;** vaccine is not recommended for use in infants <12 months of age (emergency situations) or in pediatric patients <18 years of age (nonemergency situations).
- Pregnancy: **[U.S. Boxed Warning]: Pregnant women should not be vaccinated in nonemergency situations.***In utero* transmission of virus has been observed. Pregnant women should be warned about the possibility of inadvertent transmission of vaccinia virus from others who have recently been vaccinated.

Dosage form specific issues:

- Antibiotics: Some dosage forms may contain chlortetracycline, dihydrostreptomycin, neomycin, or polymyxin B.
- Albumin: Some dosage forms may contain human albumin.

Other warnings/precautions:

- Administration: For vaccination by scarification (multiple punctures into superficial layers of the skin) only. **Not for I.M., I.V., or SubQ injection.**

- Appropriate use: The Advisory Committee on Immunization Practices (ACIP) recommends smallpox vaccination of laboratory or healthcare workers at risk of exposure. Recommendations for use in response to bioterrorism are regularly updated by the CDC, and may be found at www.cdc.gov.

- Blood and organ donation: Patients should be advised not to donate blood or organs for 21-30 days following vaccination; contacts who have inadvertently contracted vaccinia should avoid donating blood for 14 days.

- Transmission of virus: Virus may be cultured from vaccination sites until scab separates from lesion. Individuals should be instructed to avoid contact with patients at high risk of transmission/adverse effects, including patients with eczema or immunodeficiency during this time.

Pregnancy Risk FactorD

Pregnancy Considerations**[U.S. Boxed Warning]: Pregnant women should not be vaccinated in nonemergency situations.** Animal reproduction studies have not been conducted. Vaccinia vaccine has not been associated with the development of congenital malformations. On rare occasions, vaccination has been reported to cause fetal infection. Fetal vaccina infection is associated with stillbirth or neonatal mortality. Pregnancy should be avoided for at least 28 days following vaccination. Healthcare providers may enroll pregnant women who were inadvertently vaccinated during pregnancy (or within 42 days prior to conception) in the CDC pregnancy registry by calling 404-639-8253 or 877-554-4625. Military cases should be reported to the Department of Defense.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsNot recommended for use in a breast-feeding woman in a nonemergency situation. Breast-feeding should be interrupted if the vaccine is administered in an emergency situation. Breast-feeding women should take precautions to avoid inadvertent contact with a vaccinee. One case of tertiary transfer to an infant has been reported following secondary transfer to a breast-feeding woman.

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967. In addition, clinicians may enroll patients with adverse reactions in the CDC Registry at 877-554-4625. Serious adverse reactions to ACAM2000™ may also be reported to the manufacturer, Acambis Inc, at 866-440-9440.**

>10%:

Central nervous system: Fever (up to 70%; may be ≥102°F in up to 20% of children; frequency in adults may be lower), fatigue (48% to 56%), headache (35% to 51%), malaise (28% to 37%)

Dermatologic: Erythema (22% to 24%); rash (6% to 11% erythematous, folliculitis, papulovesicular, urticarial, nonspecific)

Gastrointestinal: Nausea (10% to 19%), diarrhea (12% to 16%)

Local: Injection site: Pruritus (82% to 92%), erythema (61% to 74%), pain (37% to 67%), edema (28% to 48%)

Neuromuscular & skeletal: Myalgia (27% to 46%), rigors (21% to 23%)

Miscellaneous: Lymph node pain (19% to 57%), feeling hot (20% to 32%), exercise tolerance decreased (8% to 11%), lymphadenopathy (6% to 8%)

1% to 10%:

Gastrointestinal: Constipation (6%), vomiting (3% to 5%)

Neuromuscular & skeletal: Arthralgia, back pain

Respiratory: Dyspnea (3% to 4%)

Frequency not defined: Abdominal pain, blindness, Bell's palsy, cardiomyopathy (nonischemic/dilated), contact dermatitis, corneal scarring, death, dizziness, eczema vaccinatum, encephalitis, encephalomyelitis, encephalopathy, erythema multiforme, generalized vaccinia, Guillain-Barré syndrome, hypersensitivity reactions; inadvertent inoculation at other sites (including autoinoculation to eyelid, face, genitalia, lips, mouth, nose, rectum); ischemic heart disease, keratitis, meningitis, myocarditis, myopericarditis (asymptomatic or symptomatic), ocular vaccinia, paresthesia, pericarditis, photophobia, progressive vaccinia, secondary pyogenic infection, seizure, Stevens-Johnson syndrome, vaccinial skin infection, vertigo

Drug Interactions

Immune Globulins: May diminish the therapeutic effect of Vaccines (Live). *Risk D: Consider therapy modification*

Immunosuppressants: May enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Tuberculin Tests: Vaccines (Live) may diminish the diagnostic effect of Tuberculin Tests. *Risk D: Consider therapy modification*

Varicella Virus Vaccine: Smallpox Vaccine may enhance the adverse/toxic effect of Varicella Virus Vaccine. It may be difficult to determine which vaccine caused skin lesions or other adverse effects. *Risk D: Consider therapy modification*

Test InteractionsRapid plasma regain (RPR) test: Smallpox vaccine may induce false-positive RPR test for syphilis; confirm positive RPR test using a more specific test (eg, FTA assay).

Tuberculin skin (PPD) and blood tests: Smallpox vaccine may diminish the diagnostic utility of tuberculin skin (PPD) and blood tests; avoid skin test for ≥1 month after vaccine to prevent false-negative results.

Monitoring ParametersMonitor vaccination site; inspect after 6-8 days. Evidence of a major reaction (vesicular or pustular lesion or an area of palpable induration surrounding a central lesion) confirms success of vaccination. An equivocal reaction (all responses other than a major reaction) requires revaccination in patients undergoing primary vaccination only (preferably with another vial or vaccine lot, if available). Consult CDC or state or local health department if response to a second vaccination from a different vial or lot is equivocal.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, powder for reconstitution [purified monkey cell source]:

ACAM2000™: 1-5 x 10^8 plaque-forming units per mL [contains polymyxin B, neomycin (trace amounts) and human albumin; packed with diluent, tuberculin syringes for reconstitution, and 100 bifurcated needles for administration]

Generic AvailableNo

Mechanism of ActionVaccinia virus is similar to the variola (smallpox) virus. By inducing a localized infection with vaccinia virus, immunity to both vaccinia and smallpox is achieved. Vaccination results in viral replication, production of neutralizing antibodies, immunity, and cellular hypersensitivity.

Pharmacodynamics/KineticsOnset of action: Neutralizing antibodies appear 10-13 days after vaccination.

Pharmacotherapy PearlsInitial reaction of the vaccine includes formation of a papule (2-5 days following vaccination). The papule forms a vesicle on day 5 or day 6, which becomes pustular, with surrounding erythema and induration. The maximal area of erythema usually occurs between day 8 and day 10, and crusting of the lesion normally occurs between day 14 and day 21. Formation of a major cutaneous reaction in patients undergoing primary vaccination by day 6-8 is indicative of successful acquisition of protective immunity. In patients previously vaccinated, the major cutaneous reaction typically seen by day 6-8 may be modified and/or reduced; a lack of cutaneous response does not indicate vaccination failure and revaccination is not required in these patients. At the peak of the reaction, systemic symptoms (fever, malaise) and lymphadenopathy may occur. All materials used in vaccination must be burned, boiled, or autoclaved. Vaccination can decrease the rate of severe or fatal smallpox if administered during the first 4 days of exposure.

If vaccination failure occurs, revaccination should be attempted using a different vial or vaccine lot. If the second vaccination (from a different vial or lot) also fails, contact the Centers for Disease Control and Prevention (CDC) at 404-639-3670 and/or the state or local health department prior to administering any additional vaccine.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusFatigue is common; may rarely cause encephalitis and encephalopathy

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsDried Smallpox Vaccine; Live Smallpox Vaccine; Vaccinia Vaccine

Sodium Acetate

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(SOW dee um AS e tate)

Pharmacologic CategoryElectrolyte Supplement, Parenteral

Use: Labeled IndicationsSodium source in large volume I.V. fluids to prevent or correct hyponatremia in patients with restricted intake; used to counter acidosis through conversion to bicarbonate

Dosing: Adults

Note: Sodium acetate is metabolized to bicarbonate on an equimolar basis outside the liver; administer in large volume I.V. fluids as a sodium source. Refer to Sodium Bicarbonate monograph.

Maintenance electrolyte requirements of sodium in parenteral nutrition solutions:

Daily requirements: 3-4 mEq/kg/24 hours or 25-40 mEq/1000 kcal/24 hours

Maximum: 100-150 mEq/24 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Maintenance electrolyte requirements of sodium in parenteral nutrition solutions:** I.V.: 3-4 mEq/kg/24 hours

Administration: I.V.Must be diluted prior to I.V. administration; infusion hypertonic solutions (>154 mEq/L) via a central line; maximum rate of administration: 1 mEq/kg/hour

Dietary ConsiderationsSodium and acetate content of 1 g: 7.3 mEq

StorageProtect from light, heat, and freezing.

Compatibility**Incompatible** with acids, acidic salts, alkaloid salts, calcium salts, catecholamines, atropine.

Y-site administration: Compatible: Enalaprilat, esmolol, labetalol, ondansetron.

Compatibility in syringe: Compatible: Cimetidine.

ContraindicationsAlkalosis, hypocalcemia, low sodium diets, edema, cirrhosis

Warnings/Precautions

Concerns related to adverse effects:

- Hypernatremia: Close monitoring of serum sodium concentrations is needed to avoid hypernatremia.

Disease-related concerns:

- Acid/base disorders: Use with caution in patients with acid/base alterations; contains acetate, monitor closely during acid/base correction.
- Edema: Use with caution in edematous patients.
- Heart failure (HF): Use extreme caution in patients with HF; monitor closely for edema.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment; monitor serum sodium concentrations closely.

Dosage form specific issues:

- Aluminum: Solution for injection contains aluminum; use with caution in patients with impaired renal function and in premature infants.

Other warnings/precautions:

- Extravasation: Avoid extravasation.

Pregnancy Risk FactorC

Adverse Reactions1% to 10%:

Cardiovascular: Thrombosis, hypervolemia

Dermatologic: Chemical cellulitis at injection site (extravasation)

Endocrine & metabolic: Hypernatremia, dilution of serum electrolytes, overhydration, hypokalemia, metabolic alkalosis, hypocalcemia

Gastrointestinal: Gastric distension, flatulence

Local: Phlebitis

Respiratory: Pulmonary edema

Miscellaneous: Congestive conditions

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution [concentrate]: 2 mEq/mL (20 mL, 50 mL, 100 mL; 250 mL [DSC]); 4 mEq/mL (50 mL, 100 mL)

Generic AvailableYes

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Sodium Bicarbonate

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(SOW dee um bye KAR bun ate)

U.S. Brand NamesBrioschi® [OTC]; Neut®

Pharmacologic CategoryAlkalinizing Agent; Antacid; Electrolyte Supplement, Oral; Electrolyte Supplement, Parenteral

Use: Labeled IndicationsManagement of metabolic acidosis; gastric hyperacidity; as an alkalinization agent for the urine; treatment of hyperkalemia; management of overdose of certain drugs, including tricyclic antidepressants and aspirin

Use: Unlabeled/InvestigationalPrevention of contrast-induced nephropathy (CIN)

Dosing: Adults

Cardiac arrest: I.V.: Initial: 1 mEq/kg/dose one time; maintenance: 0.5 mEq/kg/dose every 10 minutes or as indicated by arterial blood gases

Routine use of NaHCO$_3$is not recommended. May be considered in the setting of prolonged cardiac arrest only after adequate alveolar ventilation has been established and effective cardiac compressions. **Note:** In some cardiac arrest situations (eg, metabolic acidosis, hyperkalemia, or tricyclic antidepressant overdose), sodium bicarbonate may be beneficial.

Metabolic acidosis: I.V.: Dosage should be based on the following formula if blood gases and pH measurements are available:

HCO_3^-(mEq) = 0.2 x weight (kg) x base deficit (mEq/L)

Administer $^1/_2$ dose initially, then remaining $^1/_2$ dose over the next 24 hours; monitor pH, serum HCO_3^-, and clinical status

Note: If acid-base status is not available: 2-5 mEq/kg I.V. infusion over 4-8 hours; subsequent doses should be based on patient's acid-base status

Hyperkalemia: I.V.: 50 mEq over 5 minutes (as appropriate, consider methods of enhancing potassium removal/excretion)

Chronic renal failure: Oral: Initiate when plasma HCO_3^- <15 mEq/L Start with 20-36 mEq/day in divided doses, titrate to bicarbonate level of 18-20 mEq/L

Renal tubular acidosis: Oral:

Distal: 0.5-2 mEq/kg/day in 4-5 divided doses

Proximal: Initial: 5-10 mEq/kg/day; maintenance: Increase as required to maintain serum bicarbonate in the normal range

Urine alkalinization: Oral: Initial: 48 mEq (4 g), then 12-24 mEq (1-2 g) every 4 hours; dose should be titrated to desired urinary pH; doses up to 16 g/day (200 mEq) in patients <60 years and 8 g (100 mEq) in patients >60 years

Antacid: Oral: 325 mg to 2 g 1-4 times/day

Prevention of contrast-induced nephropathy (unlabeled use): I.V. infusion: 154 mEq/L sodium bicarbonate in D_5W solution: 3 mL/kg/hour for 1 hour immediately before contrast injection, then 1mL/kg/hour during contrast exposure and for 6 hours after procedure

To prepare solution, remove 154 mL from 1000 mL bag of D_5W; replace with 154 mL of 8.4% sodium bicarbonate; resultant concentration is 154 mEq/L (Merten, 2004); more practically, institutions may remove 150 mL from 1000 mL bag of D_5W and replace with 150 mL of 8.4% sodium bicarbonate; resultant concentration is 150 mEq/L

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Cardiac arrest: I.V.: Infants and Children: 0.5-1 mEq/kg/dose repeated every 10 minutes or as indicated by arterial blood gases; rate of infusion should not exceed 10 mEq/minute; neonates and children <2 years of age should receive 4.2% (0.5 mEq/mL) solution.

Routine use of NaHCO$_3$is not recommended. May be considered in the setting of prolonged cardiac arrest only after adequate alveolar ventilation has been established and effective cardiac compressions. **Note:** In some cardiac arrest situations (eg, metabolic acidosis, hyperkalemia, or tricyclic antidepressant overdose), sodium bicarbonate may be beneficial.

Metabolic acidosis: I.V.: Infants and Children: Dosage should be based on the following formula if blood gases and pH measurements are available:

HCO_3^- (mEq) = 0.3 x weight (kg) x base deficit (mEq/L)

Administer $^1/_2$ dose initially, then remaining $^1/_2$ dose over the next 24 hours; monitor pH, serum HCO_3^-, and clinical status

Note: If acid-base status is not available: Dose for older Children: 2-5 mEq/kg I.V. infusion over 4-8 hours; subsequent doses should be based on patient's acid-base status.

Chronic renal failure: Oral: Children: Initiate when plasma HCO_3^- <15 mEq/L: 1-3 mEq/kg/day

Renal tubular acidosis, distal: Oral: Children: 2-3 mEq/kg/day

Renal tubular acidosis, proximal: Children: Initial: 5-10 mEq/kg/day; maintenance: Increase as required to maintain serum bicarbonate in the normal range

Urine alkalinization: Oral: Children: 1-10 mEq (84-840 mg)/kg/day in divided doses every 4-6 hours; dose should be titrated to desired urinary pH.

Administration: I.V. DetailObserve for extravasation when giving I.V.

pH: 7.0-8.5

Dietary ConsiderationsOral product should be administered 1-3 hours after meals.

Sodium content:

Injection: 50 mL, 8.4% = 1150 mg = 50 mEq; each mL of 8.4% $NaHCO_3$ contains 23 mg sodium; 1 mEq $NaHCO_3$ = 84 mg

Granules: 2.69 g packet or capful = 770 mg sodium

Powder: 30 mEq sodium per $^1/_2$ teaspoon

StorageStore injection at room temperature. Protect from heat and from freezing. Use only clear solutions.

ReconstitutionPrevention of contrast-induced nephropathy (unlabeled use): Remove 154 mL from 1000 mL bag of D_5W; replace with 154 mL of 8.4% sodium bicarbonate; resultant concentration is 154 mEq/L (Merten, 2004); more practically, institutions may remove 150 mL from 1000 mL bag of D_5W and replace with 150 mL of 8.4% sodium bicarbonate; resultant concentration is 150 mEq/L

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, $D_5{}^1/_4$NS, $D_5{}^1/_2$NS, D_5NS, D_5W, $D_{10}W$, $^1/_2$NS, NS; **incompatible** with acids, acidic salts, alkaloid salts, calcium salts, catecholamines, and atropine; **variable stability (consult detailed reference)** in D_5LR, LR, fat emulsion 10%, TPN.

Y-site administration: Compatible: Acyclovir, alatrofloxacin, amifostine, asparaginase, aztreonam, cefepime, ceftriaxone, cladribine, cyclophosphamide, cytarabine, daunorubicin, dexamethasone sodium phosphate, dexchlorpheniramine, docetaxel, doxorubicin, etoposide, famotidine, filgrastim, fludarabine, gatifloxacin, gemcitabine, granisetron, heparin, heparin with hydrocortisone sodium succinate, ifosfamide, indomethacin, insulin (regular), levofloxacin, linezolid, melphalan, mesna, methylprednisolone sodium succinate, milrinone, morphine, paclitaxel, piperacillin/tazobactam, potassium chloride, propofol, remifentanil, tacrolimus, teniposide, thiotepa, tolazoline, vancomycin, vitamin B complex with C. **Incompatible:** Allopurinol, amiodarone, amphotericin B cholesteryl sulfate complex, calcium chloride, doxorubicin liposome, idarubicin, imipenem/cilastatin inamrinone, leucovorin, midazolam, nalbuphine, ondansetron, oxacillin, sargramostim, verapamil, vincristine, vindesine, vinorelbine. **Variable (consult detailed reference):** Ciprofloxacin, cisatracurium, diltiazem, TPN.

Compatibility in syringe: Compatible: Milrinone, pentobarbital. **Incompatible:** Etidocaine, glycopyrrolate, mepivacaine, metoclopramide, thiopental. **Variable (consult detailed reference):** Bupivacaine, chloroprocaine, lidocaine.

Compatibility when admixed: Compatible: Amikacin, aminophylline, amobarbital, amphotericin B, ampicillin, atropine, bretylium, calcium chloride, cefoxitin, ceftazidime, chloramphenicol, chlorothiazide, cimetidine, clindamycin, cytarabine, ergonovine, erythromycin lactobionate, esmolol, fentanyl and droperidol, floxacillin, furosemide, heparin, hyaluronidase, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, kanamycin, lidocaine, mannitol, metaraminol, methotrexate, methyldopate, multivitamins, nafcillin, nalmefene, netilmicin, nizatidine, ofloxacin, oxacillin, oxytocin, phenobarbital, phenylephrine, phenytoin, phytonadione, potassium chloride, prochlorperazine edisylate, thiopental, verapamil. **Incompatible:** Amiodarone, ascorbic acid injection, carboplatin, carmustine, cefotaxime, ciprofloxacin, cisplatin, dobutamine, dopamine, epinephrine, hydromorphone, imipenem/cilastatin, isoproterenol, labetalol, levorphanol, magnesium sulfate, meropenem, morphine, norepinephrine, pentazocine, procaine, streptomycin, succinylcholine, ticarcillin/clavulanate potassium, vitamin B complex with C. **Variable (consult detailed reference):** Calcium chloride, calcium gluconate, corticotropin, meperidine, methylprednisolone sodium succinate, penicillin G potassium, pentobarbital, promazine, vancomycin.

ContraindicationsAlkalosis, hypernatremia, severe pulmonary edema, hypocalcemia, unknown abdominal pain

Warnings/Precautions

Disease-related concerns:

- Cirrhosis: Use with caution in patients with cirrhosis.
- Edema: Use with caution in patients with edema.
- Heart failure: Use with caution in patients with heart failure.
- Peptic ulcer disease: Not to be used in treatment of peptic ulcer disease.
- Renal impairment: Use with caution in patients with renal impairment; may cause sodium retention.

Special populations:

- Elderly: Not the antacid of choice for the elderly because of sodium content and potential for systemic alkalosis.
- Pediatrics: Rapid administration in neonates and children <2 years of age has led to hypernatremia, decreased CSF pressure and intracranial hemorrhage.

Dosage form specific issues:

- Injection: **Use of I.V. $NaHCO_3$should be reserved for documented metabolic acidosis and for hyperkalemia-induced cardiac arrest.** Routine use in cardiac arrest is not recommended. Avoid extravasation, tissue necrosis can occur due to the hypertonicity of $NaHCO_3$.

Geriatric ConsiderationsNot the antacid of choice for the elderly because of sodium content and potential for systemic alkalosis (see maximum daily dose under Dosage).
Pregnancy Risk FactorC
LactationEnters breast milk/compatible
Adverse ReactionsFrequency not defined.

Cardiovascular: Cerebral hemorrhage, CHF (aggravated), edema

Central nervous system: Tetany

Gastrointestinal: Belching, flatulence (with oral), gastric distension

Endocrine & metabolic: Hypernatremia, hyperosmolality, hypocalcemia, hypokalemia, increased affinity of hemoglobin for oxygen-reduced pH in myocardial tissue necrosis when extravasated, intracranial acidosis, metabolic alkalosis, milk-alkali syndrome (especially with renal dysfunction)

Respiratory: Pulmonary edema

Drug Interactions

ACE Inhibitors: Antacids may decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists: Antacids may decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Dipivefrin. *Risk C: Monitor therapy*

Amphetamines: Alkalinizing Agents may decrease the excretion of Amphetamines. *Risk D: Consider therapy modification*

Amphetamines: Antacids may decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): Antacids may decrease the serum concentration of Anticonvulsants (Hydantoin). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Antacids may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Antipsychotic Agents (Phenothiazines): Antacids may decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Atazanavir: Antacids may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Bisacodyl: Antacids may diminish the therapeutic effect of Bisacodyl. Antacids may cause the delayed-release bisacodyl tablets to release drug prior to reaching the large intestine. Gastric irritation and/or cramps may occur. *Risk D: Consider therapy modification*

Cefpodoxime: Antacids may decrease the serum concentration of Cefpodoxime. *Risk C: Monitor therapy*

Cefuroxime: Antacids may decrease the serum concentration of Cefuroxime. *Risk C: Monitor therapy*

Corticosteroids (Oral): Antacids may decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

CycloSPORINE: Antacids may decrease the serum concentration of CycloSPORINE. Specifically when cyclosporine is administered orally. *Risk C: Monitor therapy*

Dabigatran Etexilate: Antacids may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Antacids may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Delavirdine: Antacids may decrease the absorption of Delavirdine. *Risk D: Consider therapy modification*

Erlotinib: Antacids may decrease the serum concentration of Erlotinib. Management: Separate the administration of erlotinib and any antacid by several hours in order to minimize the risk of a significant interaction. *Risk D: Consider therapy modification*

Iron Salts: Antacids may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Isoniazid: Antacids may decrease the absorption of Isoniazid. *Risk D: Consider therapy modification*

Lithium: Sodium Bicarbonate may increase the excretion of Lithium. *Risk C: Monitor therapy*

Memantine: Sodium Bicarbonate may decrease the excretion of Memantine. *Risk C: Monitor therapy*

Mesalamine: Antacids may diminish the therapeutic effect of Mesalamine. This appears to be formulation-related and specific to the Apriso brand of mesalamine. Management: One specific formulation of mesalamine (i.e., Apriso-brand capsules containing coated granules) should not be administered with antacids. *Risk X: Avoid combination*

Methenamine: Antacids may diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Penicillamine: Antacids may decrease the serum concentration of Penicillamine. *Risk D: Consider therapy modification*

Phosphate Supplements: Antacids may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Protease Inhibitors: Antacids may decrease the absorption of Protease Inhibitors. **Exceptions:** Darunavir. *Risk C: Monitor therapy*

QuiNIDine: Antacids may decrease the excretion of QuiNIDine. *Risk C: Monitor therapy*

Tetracycline Derivatives: Antacids may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Tocainide: Antacids may increase the serum concentration of Tocainide. *Risk C: Monitor therapy*

Trientine: Antacids may decrease the absorption of Trientine. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Concurrent doses with iron may decrease iron absorption.

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. **I.V.:** Monitor therapeutic effectiveness, adverse reactions, and infusion site (if extravasation occurs, elevate extravasation site and apply warm compresses). Monitor for signs of fluid retention. Teach patient adverse symptoms to report. **Oral:** Monitor effectiveness of treatment and adverse response. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationDo not use for chronic gastric acidity. Take as directed. Chew tablets thoroughly and follow with a full glass of water, preferably on an empty stomach (2 hours before or after food). Report CNS effects (eg, irritability, confusion); muscle rigidity or tremors; swelling of feet or ankles; respiratory difficulty; chest pain or palpitations; respiratory changes; or tarry stools. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Granules, for solution, oral [effervescent]:

Brioschi®: 2.69 g/packet (12s) [contains sodium 770 mg/packet; lemon flavor]; 2.69 g/capful (120 g, 240 g) [contains sodium 770 mg/capful; lemon flavor]

Infusion [premixed in water for injection]: 5% (500 mL) [5.95 mEq/10 mL]

Injection, solution:

4.2% (10 mL) [5 mEq/10 mL]

7.5% (50 mL) [8.92 mEq/10 mL]

8.4% (10 mL, 50 mL, 250 mL, 500 mL) [10 mEq/10 mL]

Neut®: 4% (5 mL) [2.4 mEq/5 mL; contains edetate disodium]

Powder: Sodium bicarbonate USP (120 g, 480 g) [contains sodium 30 mEq per $^1/_2$ teaspoon]

Tablet: 325 mg [3.8 mEq]; 650 mg [7.6 mEq]

Generic AvailableYes: Excludes granules

Pricing: U.S. (www.drugstore.com)

Tablets (Sodium Bicarbonate)

650 mg (1000): $20.00

Mechanism of ActionDissociates to provide bicarbonate ion which neutralizes hydrogen ion concentration and raises blood and urinary pH

Pharmacodynamics/Kinetics

Onset of action: Oral: Rapid; I.V.: 15 minutes

Duration: Oral: 8-10 minutes; I.V.: 1-2 hours

Absorption: Oral: Well absorbed

Excretion: Urine (<1%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay decrease serum lithium levels due to increased clearance but overall effect is minimal; does not offer much benefit in lithium overdose; if lithium toxicity is severe, dialysis is the treatment of choice

Cardiovascular Considerations**Prevention of Contrast-Induced Nephropathy:** A prospective, single-center, randomized trial (Merten, 2004) evaluating the efficacy of sodium bicarbonate (154 mEq/L sodium bicarbonate in D_5W) infusion (3 mL/kg/hour for 1 hour before iopamidol contrast and 1 mL/kg/hour for 6 hours after procedure) versus sodium chloride infusion (3 mL/kg/hour for 1 hour before iopamidol contrast and 1 mL/kg/hour for 6 hours after procedure). Both solutions contained 154 mEq/L of sodium. Patients needed a baseline creatinine of >1.1 mg/dL. Contrast-induced nephropathy was defined as an increase in serum creatinine levels of >25% within 2 days of contrast. One hundred and thirty-seven patients were randomized, but 119 patients completed the study. Contrast-induced nephropathy occurred in 8 patients (13.6%) infused with sodium chloride and 1 patient (1.7%) infused with sodium bicarbonate (CI 2.6-21.2%; p = 0.02). No patients developed clinical heart failure or respiratory distress with treatment. All patients had a moderate (11-14 mm Hg) increase in mean arterial pressure after the initial bolus. One patient in the sodium bicarbonate group developed a significant blood pressure increase with the bolus of sodium bicarbonate and required discontinuation of it and diuresis.

Briguori and collegues evaluated three prophylactic regimens (normal saline and acetylcysteine [NAC]; sodium bicarbonate and NAC; normal saline, ascorbic acid, and NAC) in 326 patients with chronic kidney disease (serum creatinine ≥2mg/dL) undergoing coronary and/or peripheral procedures with iodixanol. Saline was given I.V. at 1 mL/kg/hour (0.5 mL/kg/hour for LVEF <40%) for 12 hours before and 12 hours after contrast administration. Sodium bicarbonate administration was similar to that in the Merten trial. The oral NAC dose was 1200 mg twice daily given the day before and the day of contrast administration (4 doses total). The ascorbic acid dose was given I.V. as 3 g 2 hours before the procedure followed by 2 g the night of and the morning after the procedure. The amount of contrast administered and the contrast nephropathy risk scores were similar in each group. Contrast-induced nephropathy (CIN) occurred in 9.9% (11/111 of patients) of saline/NAC group, 2% (2/108 of patients) of bicarbonate/NAC group, and 10.3 %(11/107 of patients) in saline/NAC/ascorbic acid group. The bicarbonate/NAC group had significantly fewer episodes of CIN when compared to saline/NAC group in this patient population. Patients in the bicarbonate group were the only ones to achieve urinary alkalinization.

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: The use of bicarbonate for the treatment of lactic acidosis has not been proven useful. Increased pCO_2 after bicarbonate administration may result in an acute decrease in intracellular pH. Bicarbonate does not improve any hemodynamic parameters resulting in improved cardiovascular function. Many clinicians do not use bicarbonate in the treatment of lactic acidosis regardless of the patient's pH level.

Evidence-Based Information: The 2008 Surviving Sepsis Campaign guidelines recommend avoiding use of sodium bicarbonate therapy for the purpose of improving hemodynamics or reducing vasopressor requirements in patients with hypoperfusion-induced lactic academia with pH ≥7.15 (Grade 1B).

Index Terms

Baking Soda; $NaHCO_3$; Sodium Acid Carbonate; Sodium Hydrogen Carbonate

Medication Safety Issues

Per JCAHO recommendations, concentrated electrolyte solutions (eg, NaCl >0.9%) should not be available in patient care areas.

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (I.V. formulation >0.9% concentration) among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(SOW dee um KLOR ide)

U.S. Brand Names4-Way® Saline Moisturizing Mist [OTC]; Altachlore [OTC]; Altamist [OTC]; Ayr® Allergy Sinus [OTC]; Ayr® Baby Saline [OTC]; Ayr® Saline No-Drip [OTC]; Ayr® Saline [OTC]; Breathe Free® [OTC]; Deep Sea [OTC]; Entsol® [OTC]; Humist® for Kids [OTC]; Humist® [OTC]; Hyper-Sal™; Little Noses® Saline [OTC]; Little Noses® Stuffy Nose Kit [OTC] ; Muro 128® [OTC]; Mycinaire™ [OTC] [DSC]; Na-Zone® [OTC]; Nasal Moist® Saline [OTC]; Nasal Spray [OTC]; NāSal™ [OTC]; Ocean® for Kids [OTC]; Ocean® [OTC]; Pretz® [OTC]; Saline Mist [OTC]; SalineX® [OTC] [DSC]; Simply Saline® Baby [OTC]; Simply Saline® Nasal Moist® [OTC] ; Simply Saline® [OTC]; Syrex; Wound Wash Saline™ [OTC]

Pharmacologic CategoryElectrolyte Supplement, Parenteral; Genitourinary Irrigant; Irrigant; Lubricant, Ocular; Sodium Salt

Use: Labeled Indications

Parenteral: Restores sodium ion in patients with restricted oral intake (especially hyponatremia states or low salt syndrome). In general, parenteral saline uses:

Bacteriostatic sodium chloride: Dilution or dissolving drugs for I.M., I.V., or SubQ injections

Concentrated sodium chloride: Additive for parenteral fluid therapy

Hypertonic sodium chloride: For severe hyponatremia and hypochloremia

Hypotonic sodium chloride: Hydrating solution

Normal saline: Restores water/sodium losses

Pharmaceutical aid/diluent for infusion of compatible drug additives

Ophthalmic: Reduces corneal edema

Inhalation: Restores moisture to pulmonary system; loosens and thins congestion caused by colds or allergies; diluent for bronchodilator solutions that require dilution before inhalation

Intranasal: Restores moisture to nasal membranes

Irrigation: Wound cleansing, irrigation, and flushing

Use: Unlabeled/InvestigationalTraumatic brain injury (hypertonic sodium chloride)

Dosing: Adults

GU irrigant: Irrigation: 1-3 L/day by intermittent irrigation

Replacement: I.V.: Determined by laboratory determinations mEq

Hyponatremia: Sodium deficiency (mEq/kg) = [% dehydration (L/kg)/100 x 70 (mEq/L)] + [0.6 (L/kg) x (140 - serum sodium) (mEq/L)]

To correct acute, serious hyponatremia: mEq sodium = [desired sodium (mEq/L) - actual sodium (mEq/L)] x [0.6 x wt (kg)]; for acute correction use 125 mEq/L as the desired serum sodium; acutely correct serum sodium in 5 mEq/L/dose increments; more gradual correction in increments of 10 mEq/L/day is indicated in the asymptomatic patient

Traumatic brain injury (unlabeled use): I.V.: Hypertonic saline: **Note:** Dosing may vary among institutions. Some protocols include: 7.5%: 250 mL; 23.5%: 30 mL administered over 30 minutes; 2% to 3% as a continuous infusion (some clinicians may mix with sodium acetate to decrease hyperchloremic acidosis). Adjust according to intracranial pressure, serum sodium and chloride, and acid-base status.

Chloride maintenance electrolyte requirement in parenteral nutrition: 2-4 mEq/kg/24 hours or 25-40 mEq/1000 kcals/24 hours; maximum: 100-150 mEq/24 hours

Sodium maintenance electrolyte requirement in parenteral nutrition: 3-4 mEq/kg/24 hours or 25-40 mEq/1000 kcals/24 hours; maximum: 100-150 mEq/24 hours.

Approximate Deficits of Water and Electrolytes in Moderately Severe Dehydration[1]

Condition	**Water**	**Sodium**

	(mL/kg)	(mEq/kg)
Fasting and thirsting	100-120	5-7
Diarrhea		
isonatremic	100-120	8-10
hypernatremic	100-120	2-4
hyponatremic	100-120	10-12
Pyloric stenosis	100-120	8-10
Diabetic acidosis	100-120	9-10
[1] A **negative** deficit indicates total body **excess** prior to treatment.

Ophthalmic:

Ointment: Apply once daily or more often

Solution: Instill 1-2 drops into affected eye(s) every 3-4 hours

Bronchodilator diluent: Inhalation: 1-3 sprays (1-3 mL) to dilute bronchodilator solution in nebulizer before administration

Nasal congestion: Intranasal: 2-3 sprays in each nostril as needed

Irrigation: Spray affected area

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Hyponatremia: I.V.: Children: Hypertonic solutions (>0.9%) should only be used for the initial treatment of acute serious symptomatic hyponatremia; maintenance: 3-4 mEq/kg/day; maximum: 100-150 mEq/day; dosage varies widely depending on clinical condition

Replacement: Determined by laboratory determinations mEq

Sodium deficiency (mEq/kg) = [% dehydration (L/kg)/100 x 70 (mEq/L)] + [0.6 (L/kg) x (140 - serum sodium) (mEq/L)]

Children ≥2 years:

Intranasal: Refer to adult dosing.

Irrigation: Refer to adult dosing.

Inhalation: Refer to adult dosing.

Administration: TopicalIrrigation solution: Do not warm >66°C (150°F); not for I.V. use. Wound Wash Saline™: Before use, expel a short stream into air to clear nozzle.
StorageStore injection at room temperature; do not freeze. Protect from heat. Use only clear solutions.
CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4$NS, $D_5{}^1/_2$NS, D_5NS, D_5W, D_{10}W, LR, ${}^1/_2$NS, NS; **variable stability (consult detailed reference)** in fat emulsion 10%, mannitol 20%, mannitol 25%.

Y-site administration: Compatible: Ciprofloxacin.

Compatibility in syringe: Compatible: Cimetidine.

ContraindicationsHypersensitivity to sodium chloride or any component of the formulation; hypertonic uterus, hypernatremia, fluid retention
Warnings/Precautions

Concerns related to adverse effects:

- Sodium toxicity: Is almost exclusively related to how fast a sodium deficit is corrected; both rate and magnitude are extremely important.

Disease-related concerns:

- Cirrhosis: Use with caution in patients with cirrhosis.

- Edema: Use with caution in patients with edema.
- Heart failure: Use with caution in patients with heart failure.
- Hypertension: Use with caution in patients with hypertension.
- Renal impairment: Use with caution in patients with renal impairment; may cause sodium retention.

Dosage form specific issues:

- Bacteriostatic sodium chloride: Do not use bacteriostatic sodium chloride in newborns since benzyl alcohol preservatives have been associated with toxicity.
- Irrigants: For external use only; not for parenteral use. Do not use during electrosurgical procedures. Irrigating fluids may be absorbed into systemic circulation; monitor for fluid or solute overload.
- Wound Wash Saline™: For single-patient use only.

Pregnancy Risk FactorC
Adverse ReactionsFrequency not defined.

Cardiovascular: Congestive conditions

Endocrine & metabolic: Extravasation, hypervolemia, hypernatremia, dilution of serum electrolytes, overhydration, hypokalemia

Local: Thrombosis, phlebitis, extravasation

Respiratory: Pulmonary edema

Drug Interactions

Lithium: Sodium Chloride may increase the excretion of Lithium. *Risk C: Monitor therapy*

Monitoring ParametersSerum sodium, potassium, chloride, and bicarbonate levels; I & O, weight
Reference RangeSerum/plasma sodium levels:

Neonates:

Full-term: 133-142 mEq/L

Premature: 132-140 mEq/L

Children ≥2 months to Adults: 135-145 mEq/L

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Aerosol, intranasal [spray; preservative free]:

Entsol®: 3% (100 mL) [chlorofluorocarbon free]

Gel, intranasal:

Ayr® Saline: <0.5% (14 g) [contains soybean oil and aloe]

Entsol®: 3% (20 g) [contains benzalkonium chloride; with aloe and vitamin E]

Simply Saline® Nasal Moist®: 0.65% (30 g) [contains aloe]

Gel, intranasal [spray]:

Ayr® Saline No-Drip: <0.5% (22 mL) [contains benzalkonium chloride, benzyl alcohol, and soybean oil]

Injection, solution: 0.45% (25 mL, 50 mL, 100 mL, 250 mL, 500 mL, 1000 mL); 0.9% (25 mL, 50 mL, 100 mL, 150 mL, 250 mL, 500 mL, 1000 mL, 1 g); 3% (500 mL); 5% (500 mL)

Injection, solution [preservative free]: 0.9% (2 mL, 3 mL, 5 mL, 10 mL, 20 mL, 50 mL, 100 mL)

Injection, solution [I.V. flush]: 0.9% (10 mL)

Injection, solution [I.V. flush; preservative free]: 0.9% (1 mL, 2 mL, 2.5 mL, 3 mL, 5 mL, 10 mL)

Syrex: 0.9% (2.5 mL, 3 mL, 5 mL, 10 mL)

Injection, solution [bacteriostatic]: 0.9% (10 mL, 20 mL, 30 mL)

Injection, solution [concentrate]: 14.6% (40 mL); 23.4% (100 mL, 250 mL)

Injection, solution [concentrate; preservative free]: 14.6% (20 mL, 40 mL); 23.4% (30 mL, 100 mL, 200 mL)

Ointment, ophthalmic: 5% (3.5 g)

Altachlore: 5% (3.5 g)

Ointment, ophthalmic [preservative free]:

Muro 128®: 5% (3.5 g)

Powder for solution, intranasal [preservative free]:

Entsol®: 3% (10.5 g)

Solution for blood processing [not for injection]: 0.9% (3000 mL)

Solution for inhalation [preservative free]: 0.9% (3 mL, 5 mL, 15 mL); 3% (15 mL)

Solution for inhalation [hypertonic; preservative free]: 10% (15 mL)

Solution for inhalation [hypotonic; preservative free]: 0.45% (5 mL)

Solution for injection [I.V. flush; preservative free]: 0.9% (2.5 mL, 5 mL, 10 mL)

Solution for irrigation: 0.45% (2000 mL); 0.9% (250 mL, 500 mL, 1000 mL, 1500 mL, 2000 mL, 3000 mL, 4000 mL, 5000 mL)

Solution for irrigation [preservative free]: 0.45% (1500 mL [DSC]; 2000 mL); 0.9% (250 mL, 500 mL, 1000 mL, 1500 mL, 2000 mL, 3000 mL)

Solution for irrigation [slush solution]: 0.9% (1000 mL)

Solution for nebulization [preservative free]:

Hyper-Sal™: 7% (4 mL)

Solution, intranasal [preservative free]:

Simply Saline®: 3% (44 mL)

Solution, intranasal [drops]:

Ayr® Saline: 0.65% (50 mL) [alcohol free; contains benzalkonium chloride]

NāSal™: 0.65% (15 mL) [alcohol free; contains benzalkonium chloride]

SalineX®: 0.4% (15 mL) [contains benzalkonium chloride] [DSC]

Solution, intranasal [drops, mist, spray]

Humist®: 0.65% (45 mL) [ethanol free]

Humist® for Kids: 0.65% (30 mL) [ethanol free; bubblegum flavor]

Ocean®: 0.65% (45 mL, 473 mL) [gluten free; contains benzalkonium chloride and benzyl alcohol]

Ocean® for Kids: 0.65% (37.5 mL) [alcohol free; contains benzalkonium chloride]

Solution, intranasal [drops, spray]:

Ayr® Baby Saline: 0.65% (30 mL) [ethanol free; contains benzalkonium chloride]

Little Noses® Saline: 0.65% (30 mL) [contains benzalkonium chloride]

Little Noses® Stuffy Nose Kit: 0.65% (15 mL) [contains benzalkonium chloride]

Solution, intranasal [drops, spray, stream]:

Saline Mist: 0.65% (45 mL) [contains benzalkonium chloride] [DSC]

Solution, intranasal [irrigation]:

Pretz®: 0.75% (237 mL, 960 mL) [contains benzalkonium chloride and sodium benzoate; with yerba santa]

Solution, intranasal [mist]:

Ayr® Allergy Sinus: 2.65% (50 mL)

Ayr® Saline: 0.65% (50 mL) [ethanol free; contains benzalkonium chloride]

Entsol®: 3% (30 mL) [contains benzalkonium chloride]

Mycinaire™: 0.65% (30 mL) [contains benzalkonium chloride] [DSC]

Saline Mist: 0.65% (45 mL) [contains benzalkonium chloride]

SalineX®: 0.4% (50 mL) [contains benzalkonium chloride] [DSC]

4-Way® Moisturizing Mist: 0.74% (29.6 mL) [ethanol free; contains benzalkonium chloride and menthol]

Solution, intranasal [mist, preservative free]:

Simply Saline®: 0.9% (44 mL, 90 mL)

Simply Saline® Baby: 0.9% (45 mL)

Solution, intranasal [nasal wash; preservative free]:

Entsol®: 3% (240 mL)

Solution, intranasal [spray]:

Altamist: 0.65% (60 mL) [contains benzalkonium chloride]

Breathe Free®: 0.65% (44.3 mL) [contains benzalkonium chloride]

Deep Sea: 0.65% (45 mL) [contains benzalkonium chloride and benzyl alcohol]

Na-Zone®: 0.65% (60 mL) [contains benzalkonium chloride]

Nasal Moist® Saline: 0.65% (45 mL)

Nasal Spray: 0.65% (45 mL) [contains benzalkonium chloride and benzyl alcohol]

NāSal™: 0.65% (30 mL) [ethanol free; contains benzalkonium chloride and thimerosal]

Solution, intranasal [spray, isotonic, buffered]:

Pretz®: 0.75% (50 mL) [contains benzalkonium chloride and sodium benzoate; with yerba santa]

Solution, ophthalmic: 5% (15 mL)

Solution, ophthalmic [drops]: 5% (15 mL)

Altachlore: 5% (15 mL, 30 mL)

Muro 128®: 2% (15 mL); 5% (15 mL, 30 mL)

Solution, topical [preservative free]:

Wound Wash Saline™: 0.9% (90 mL, 210 mL)

Swab, intranasal:

Ayr® Saline: <0.5% (20) [contains aloe and soybean oil]

Tablet for solution, topical: 1000 mg

Mechanism of ActionPrincipal extracellular cation; functions in fluid and electrolyte balance, osmotic pressure control, and water distribution
Pharmacodynamics/Kinetics

Absorption: Oral, I.V.: Rapid

Distribution: Widely distributed

Excretion: Primarily urine; also sweat, tears, saliva

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentSodium chloride intake may decrease serum lithium levels; monitor
Mental Health CommentHyponatremia is associated with neuropsychiatric symptoms; rule out psychogenic polydipsia.
Anesthesia and Critical Care Concerns/Other ConsiderationsAn Australian/New Zealand group recently published results from their evaluation of resuscitation fluid (4% albumin versus normal saline) in a heterogeneous intensive care population (Finfer, 2004). They conducted this multicenter, randomized, double-blind trial to compare the effects of resuscitation fluid on mortality from any cause during the 28-day period after randomization. Patients were eligible for inclusion if the treating clinician judged that fluid resuscitation was required for intravascular fluid depletion as supported by one of the following criteria:

Heart rate >90 bpm

Systolic BP <100 mm Hg

Mean arterial BP <75 mm Hg

Decrease of 40 mm Hg in systolic or mean arterial BP (as compared with baseline)

CVP <10 mm Hg

PCWP <12 mm Hg

Respiratory variation in systolic or mean BP >5 mm Hg

Capillary refill time >1 second

Urine output <0.5 mL/kg for 1 hour

Patients were excluded for a variety of reasons, including ICU transfer following cardiac or liver transplantation surgery, or burn treatment. Almost 7000 patients were randomized; 3497 to albumin and 3500 to saline. Baseline characteristics were similar between the groups, except CVP pressure was slightly higher in the albumin group (9.0 in albumin versus 8.6 in saline). There was no significant mortality difference between groups (726 deaths in albumin group; 729 deaths in saline group). There were no significant differences in secondary endpoints (length of stay in the ICU or hospital, days of mechanical ventilation, and days of renal replacement therapy). Similar outcomes resulted from use of either fluid for resuscitation in this patient population.

The 2008 Surviving Sepsis Campaign guidelines suggest that during the first 6 hours of resuscitation, the goals of sepsis-induced hypoperfusion should include central venous pressure 8-12 mm Hg, mean arterial pressure ≥65 mm Hg, urine output >0.5 mL/kg/hour, central venous (superior vena cava) oxygen saturation ≥70% or mixed venous oxygen saturation ≥65% (Grade 2C).

Management of Intracerebral Hemorrhage (ICH): Rapid identification of patients experiencing ICH is essential and should be considered a medical emergency due to the progressive deterioration, severe clinical deficits, and high mortality and morbidity. Treatment for ICH has evolved rapidly in recent years. According to the 2007 ACC/AHA Guidelines for the Management of Spontaneous Intracerebral Hemorrhage in Adults, patients with ICH should be treated in a balanced and graded approach with therapies that reduce intracranial pressure (ICP) (eg, mannitol, hypertonic saline solutions, barbiturate coma, head of bed elevation) (Class IIa recommendation). Direct monitoring of ICP and central perfusion pressure (CPP) may be necessary if patient is treated more aggressively. Treatment of ICH with recombinant factor VIIa (rFVIIa) within the first 3-4 hours after onset to slow progression of bleeding has shown promise; however, at this time it cannot be routinely recommended in all patients experiencing ICH (Class IIb recommendation).

Blood pressure (BP) management in patients who are hypertensive is also of paramount importance in treating ICH. The primary rationale for lowering BP is to prevent further progression of the bleed. This can be accomplished using a number of different pharmacologic treatments (eg, nicardipine, labetalol, nitroprusside). Nitroprusside may increase ICP due to the pronounced vasodilatory actions and as a result may be less preferable. Specific BP targets are not supported by available evidence. The 2007 ACC/AHA Guidelines recommend initiating antihypertensive therapy if the SBP >180 mm Hg or if MAP >130 mm Hg.

Sodium Chondroitin Sulfate and Sodium Hyaluronate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(SOW de um kon DROY tin SUL fate & SOW de um hye al yoor ON ate)
U.S. Brand NamesDisCoVisc®; Viscoat®
Pharmacologic CategoryOphthalmic Agent, Viscoelastic
Use: Labeled IndicationsOphthalmic surgical aid in the anterior segment during cataract extraction and intraocular lens implantation
Dosing: Adults**Surgical aid:** Ophthalmic: Carefully introduce (using a 27-gauge cannula) into anterior chamber during surgery
Dosing: ElderlyRefer to adult dosing.
Administration: OtherConsult specific product instructions on preparing ophthalmic device for use and administration by physician during surgery. May inject in the anterior segment of the eye prior to or following delivery of the crystalline lens. Instillation prior to lens delivery provides additional protection to corneal endothelium, protecting it from possible damage arising from surgical instrumentation. May also be used to coat intraocular lens and tips of surgical instruments prior to implantation surgery. May inject additional solution during anterior segment surgery to fully maintain the solution lost during surgery. At the end of surgery, remove solution by thoroughly irrigating and aspirating with a sterile irrigating solution (eg, balanced salt solution).
Storage

Viscoat®: Store at 2°C to 8°C (36°F to 46°F); do not freeze.

DisCoVisc™: Store at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light. Prior to use, allow product to warm to room temperature (~20-40 minutes).

ContraindicationsHypersensitivity to chondroitin, hyaluronate, or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Elevated intraocular pressure: Intraocular pressure may be elevated as a result of pre-existing glaucoma, compromised outflow, and by operative procedures and sequelae.

- Hypersensitivity: Potential risk of hypersensitivity may exist to the use of any biological material.

Dosage form specific issues:

- Latex: Some dosage forms may contain latex.

Other warnings/precautions:

- Appropriate use: Do not overfill the anterior chamber; carefully monitor IOP, especially during the immediate postoperative period. For intraocular use only; serious eye injury may occur if proper assembly using cannula and cannula locking ring are not followed or alternate cannula is used.

Pregnancy Risk FactorC
Adverse ReactionsFrequency not defined: Ocular: Intraocular pressure increased
Drug InteractionsThere are no known significant interactions.
Test InteractionsFalse-negative results for Clinistix® urine test; false-positive results with Clinitest®
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, intraocular:

DisCoVisc®: Sodium chondroitin sulfate ≤4% and sodium hyaluronate ≤1.7% (0.5 mL, 1 mL) [provided in a kit which also contains 27-gauge cannula and cannula locking ring]

Viscoat®: Sodium chondroitin sulfate ≤4% and sodium hyaluronate ≤3% (0.5 mL, 0.75 mL) [packaging contains latex; packaged with 27-gauge cannula and cannula locking ring]

Generic AvailableNo
Mechanism of ActionOphthalmic viscosurgical device which modulates the interactions between adjacent tissues by space creation, tissue stabilization, balancing pressure, and providing protection of the corneal endothelial cells during surgery.
Pharmacodynamics/Kinetics

Absorption: Intravitreous injection: Diffusion occurs slowly

Excretion: By Canal of Schlemm

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Index Terms Chondroitin Sulfate and Sodium Hyaluronate; Sodium Hyaluronate and Chondroitin Sulfate

References

Sodium Citrate and Citric Acid

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(SOW dee um SIT rate & SI trik AS id)
U.S. Brand NamesBicitra®; Cytra-2; Oracit®; Shohl's Solution (Modified)
Canadian Brand NamesPMS-Dicitrate
Pharmacologic CategoryAlkalinizing Agent, Oral
Use: Labeled IndicationsTreatment of metabolic acidosis; alkalinizing agent in conditions where long-term maintenance of an alkaline urine is desirable
Dosing: Adults**Systemic alkalization:** Oral: 10-30 mL with water after meals and at bedtime
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Systemic alkalization:** Oral: Infants and Children: 2-3 mEq/kg/day in divided doses 3-4 times/day **or** 5-15 mL with water after meals and at bedtime
Administration: OralAdminister after meals. Dilute with 30-90 mL of water to enhance taste. Chilling solution prior to dosing helps to enhance palatability.
Dietary ConsiderationsShould be taken after meals to avoid laxative effect.
StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F); do not freeze. Protect from excessive heat.
ContraindicationsHypersensitivity to sodium citrate, citric acid, or any component of the formulation; severe renal insufficiency; sodium-restricted diet
Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with heart failure or hypertension; contains sodium.
- Edema: Use with caution in patients with peripheral or pulmonary edema; contains sodium.
- Hepatic impairment: Use with caution in patients with hepatic failure; conversion to bicarbonate may be impaired.
- Renal impairment: Use with caution in patients with renal impairment; contains sodium. Contraindicated in patients with severe impairment.
- Severely ill: Use with caution in patients who are severely ill; conversion to bicarbonate may be impaired.
- Shock: Use with caution in patients who are in shock; conversion to bicarbonate may be impaired.

Pregnancy Risk FactorNot established
Pregnancy ConsiderationsUse caution with toxemia of pregnancy.
LactationExcretion in breast milk unknown/compatible
Adverse ReactionsFrequency not defined. Generally well tolerated with normal renal function.

Central nervous system: Tetany

Endocrine & metabolic: Metabolic alkalosis, hyperkalemia

Gastrointestinal: Diarrhea, nausea, vomiting

Drug Interactions

Aluminum Hydroxide: Citric Acid Derivatives may increase the absorption of Aluminum Hydroxide. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringAssess kidney function prior to starting therapy. Monitor cardiac status and serum potassium at beginning of therapy and at regular intervals with long-term therapy. Assess knowledge/teach patient appropriate use, possible side effects, and adverse symptoms to report.
Patient EducationTake as often as directed, after meals, and at least 2 hours before or after any other medications. Dilute with 1-3 oz of water and follow with additional water; chilling solution prior to taking will help to improve taste. You may experience diarrhea or nausea and vomiting; if severe, contact prescriber. Report CNS changes status (eg, irritability, tremors, confusion); swelling of feet or ankles; respiratory difficulty or palpitations; abdominal pain or tarry stools.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. **Note:** Contains sodium 1 mEq/mL and is equivalent to bicarbonate 1 mEq/mL

Solution, oral: Sodium citrate 500 mg and citric acid 334 mg per 5 mL (480 mL)

Bicitra®: Sodium citrate 500 mg and citric acid 334 mg per 5 mL (480 mL) [sugar free; grape flavor]

Cytra-2: Sodium citrate 500 mg and citric acid 334 mg per 5 mL (480 mL) [alcohol free, dye free, sugar free; contains propylene glycol and sodium benzoate; grape flavor]

Oracit®: Sodium citrate 490 mg and citric acid 640 mg per 5 mL (15 mL, 30 mL, 500 mL, 3840 mL)

Shohl's Solution (Modified): Sodium citrate 500 mg and citric acid 300 mg per 5 mL (480 mL) [contains alcohol]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Bicitra)

500-334 mg/5 mL (473): $31.98

Solution (Cytra-2)

500-334 mg/5 mL (473): $14.00

Pharmacodynamics/Kinetics

Metabolism: Oxidized to sodium bicarbonate

Excretion: Urine (<5% as sodium citrate)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentSodium chloride intake may decrease serum lithium levels; monitor

Mental Health CommentAlkalization of the urine may increase toxicity of amphetamine, ephedrine, and pseudoephedrine.

Index TermsModified Shohl's Solution

Sodium Hypochlorite Solution

Jump To Field (Select Field Name)

Pronunciation(SOW dee um hye poe KLOR ite soe LOO shun)
U.S. Brand NamesDakin's Solution; Di-Dak-Sol
Pharmacologic CategoryDisinfectant, Antibacterial, Topical
Use: Labeled IndicationsTreatment of athlete's foot (0.5%); wound irrigation (0.5%); disinfection of utensils and equipment (5%)
Dosing: Adults**Disinfectant:** Topical: Via irrigation
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricTopical irrigation
Administration: TopicalFor external use only; do **not** ingest.
StorageUse prepared solution within 7 days.
ContraindicationsHypersensitivity to any component of the formulation
Warnings/Precautions

Other warnings/precautions:

â˘ Appropriate use: For external use only; avoid eye or mucous membrane contact; do not use on open wounds.

Pregnancy Risk FactorC
LactationFor external use
Adverse ReactionsFrequency not defined.

Dermatologic: Irritating to skin

Hematologic: Dissolves blood clots, delays clotting

Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringAssess knowledge/teach patient appropriate application and use and adverse symptoms to report.
Patient EducationUse exactly as directed; do not overuse. Avoid contact with eyes. Report worsening of condition or lack of healing. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, topical:

Dakin's: 0.125% (480 mL); 0.25% (480 mL); 0.5% (480 mL, 3840 mL)

Di-Dak-Sol: 0.0125% (480 mL)

Generic AvailableNo
Pharmacotherapy PearlsDakin's solution may hinder wound healing.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Sodium Iodide I^{131}

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(SOW dee um EYE oh dide)

U.S. Brand NamesHicon™; Iodotope®

Pharmacologic CategoryAntithyroid Agent; Radiopharmaceutical

Use: Labeled IndicationsFor diagnostic use with the radioactive iodide (RAI) uptake test to evaluate thyroid function; treatment of hyperthyroidism and select cases of thyroid cancer

Dosing: Adults**Note:** Consult manufacturer potency tables when applicable. All doses should be individualized; general ranges are listed here:

Diagnostic procedures: Oral (based on a 70 kg patient):

Thyroid uptake: 0.185–0.555 megabecquerels (5-15 microcuries)

Scintiscanning: 1.85-3.7 megabecquerels (50-100 microcuries)

Localization of extrathyroid metastases: 37 megabecquerels (1000 microcuries)

Treatment: Oral:

Hyperthyroidism: 148-370 megabecquerels (4-10 millicuries)

Thyroid cancer:

Iodotope®: Ablation of normal thyroid tissue: Initial: 1850 megabecquerels (50 millicuries)

Subsequent therapeutic doses: 3700-5550 megabecquerels (100-150 millicuries)

Hicon™: Ablation of normal thyroid tissue: Initial: 1100-3700 megabecquerels (1.1-3.7 gigabecquerels or 30-100 millicuries)

Subsequent metastases ablation: 3700-7400 megabecquerels (3.7-7.4 gigabecquerels or 100-200 millicuries)

Dosing: ElderlyRefer to adult dosing.

Administration: Oral

Hicon™ must be diluted prior to administration. Ensure adequate hydration before and after treatment. Waterproof gloves should be worn while handling and administering sodium iodide I^{131}.

Dietary ConsiderationsSome dietary sources of iodine include cow's milk and dairy products, fish, seaweed, eggs, chocolate, and iodized salt.

StorageStore at controlled room temperature. Products should be adequately shielded.

Hicon™: Prior to use, store solution at 2°C to 25°C (36°F to 77°F). Prepared capsule should be stored in suitable polypropylene container inside a lead pot; use within 7 days of preparation.

ReconstitutionHicon™: Wear waterproof gloves for preparation and handling. Using a shielded syringe, transfer appropriate amount to shielded empty vial. Dilute with purified water containing sodium thiosulfate 0.2% (as reducing agent). Place unopened small capsule (contains dibasic sodium phosphate as absorbing buffer) into bottom half of opened large (empty) capsule; inject appropriate volume of diluted sodium iodide I^{131} into the center of the unopened small capsule, cover and seal with upper half of large capsule. Refer to manufacturer's labeling for additional details.

ContraindicationsHypersensitivity to iodine or any component of the formulation; pre-existing vomiting and diarrhea (treatment); concurrent antithyroid medication (Hicon™); pregnancy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Disease-related concerns:

- Hyperthyroidism/thyrotoxic cardiac disease: May be aggravated by radiation thyroiditis; consider pre- and post-treatment with antithyroid agents and/or beta-blockers.
- Hypochloremia: May increase thyroid uptake of sodium iodide I^{131}.
- Renal impairment: Use with caution in patients with renal impairment; risk of adverse reactions may be increased. Nephrosis may increase thyroid uptake of sodium iodide I^{131}.

Concurrent drug therapy issues:

- Iodine/thyroid medications: Concomitant use of iodine, thyroid, or antithyroid medications may interfere with the uptake of radioiodide; medications should be discontinued for an appropriate time prior to dosing.

Special populations:

- Patients <30 years of age: Use is not generally recommended for treatment of hyperthyroidism in patients <30 years of age.

Dosage form specific issues:

- Sodium bisulfite: Some dosage forms may contain sodium bisulfite which may cause allergic reactions in some individuals.

Other warnings/precautions:

- Appropriate use: Patients should be adequately hydrated prior to dosing.

- Experienced staff: Should only be used by nuclear physicians and/or radiopharmacists qualified and experienced in use and handling of radionuclides.

- Patient information: Patients must be instructed in measures to minimize exposure of others.

Pregnancy Risk FactorX

Pregnancy ConsiderationsIodine-131 crosses the placenta and may cause severe and irreversible hypothyroidism in neonates. Pregnancy should be ruled out prior to therapy. Effective contraception is recommended for 12 months following treatment for cancer, 6-12 months following treatment for hyperthyroidism.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsBreast milk concentrations may be equal to or greater than maternal plasma levels. The American Academy of Pediatrics considers radioactive iodine a compound which requires temporary cessation of breast-feeding. They suggest the breast-feeding mother pump prior to the study and store milk in the freezer for feeding the infant. Following the study, pumping should continue to maintain milk production, but milk should be discarded until radioactivity is no longer detected in the milk. The Society of Nuclear Medicine guidelines suggest breast-feeding for that child be discontinued permanently.

Adverse ReactionsFrequency not defined, dose dependent.

Cardiovascular: Chest pain, tachycardia

Dermatologic: Alopecia, hives, itching, rash

Endocrine & metabolic: Acute thyroid crisis

Gastrointestinal: Nausea, sialoadenitis, sore throat, swallowing pain, vomiting

Hematologic: Acute leukemia, anemia, blood dyscrasia, leukopenia, thrombocytopenia

Neuromuscular & skeletal: Neck tenderness/swelling

Respiratory: Bronchospasm, cough

Miscellaneous: Allergic reactions, anaphylaxis, chromosomal abnormalities, hypersensitivity, immunosuppression

Drug Interactions

Amiodarone: May diminish the therapeutic effect of Sodium Iodide I131. *Risk D: Consider therapy modification*

Antithyroid Agents: May diminish the therapeutic effect of Sodium Iodide I131. Management: Discontinue antithyroid therapy 3-4 days prior to sodium iodide I-131 administration. *Risk X: Avoid combination*

Thyroid Products: May diminish the therapeutic effect of Sodium Iodide I131. *Risk X: Avoid combination*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule [diagnostic]: 0.555 megabecquerels [15 microcuries]; 0.925 megabecquerels [25 microcuries]; 1.85 megabecquerels [50 microcuries]; 3.7 megabecquerels [100 microcuries]

Capsule [therapeutic]: 28-3700 megabecquerels [0.75-100 millicuries]

    Iodotope®: 37-4810 megabecquerels [1-130 millicuries]

Kit [therapeutic]:

- Hicon™ 9.25 gigabecquerels (250 millicuries):
    - Capsule: Dibasic sodium phosphate 300 mg (10s)
    - Capsule: Empty large gelatin capsule (10s)
    - Solution: Sodium iodide I^{131} 9.25 gigabecquerels (250 millicuries) per 0.25 mL (0.25 mL) [contains edetate disodium, sodium thiosulphate and dibasic sodium phosphate]
- Hicon™ 18.5 gigabecquerels (250 millicuries):
    - Capsule: Dibasic sodium phosphate 300 mg (10s)

Capsule: Empty large gelatin capsule (10s)

Solution: Sodium iodide I^{131} 18.5 gigabecquerels (500 millicuries) per 0.5 mL (0.5 mL) [contains edetate disodium, sodium thiosulphate and dibasic sodium phosphate]

Hicon™ 37 gigabecquerels (1000 millicuries):

Capsule: Dibasic sodium phosphate 300 mg (10s)

Capsule: Empty large gelatin capsule (10s)

Solution: Sodium iodide I^{131} 37 gigabecquerels (1000 millicuries) per 1 mL (1 mL) [contains edetate disodium, sodium thiosulphate and dibasic sodium phosphate]

Solution [therapeutic]: 129.5-5550 megabecquerels per vial [3.5-150 millicuries per vial; contains sodium bisulfite and edetate disodium]

Generic AvailableYes

Pharmacodynamics/Kinetics

Absorption: Readily absorbed following oral administration

Distribution: Extracellular fluid; primarily trapped by the thyroid

Protein binding: None

Metabolism: Iodide is rapidly oxidized to iodine in the thyroid

Excretion: Urine (37% to 75%)

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsI ^{131}; Iodine ^{131}

Sodium Lactate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(SOW dee um LAK tate)
Pharmacologic CategoryAlkalinizing Agent, Parenteral
Use: Labeled IndicationsSource of bicarbonate for prevention and treatment of mild to moderate metabolic acidosis
Dosing: Adults**Bicarbonate precursor:** I.V.: Dosage depends on degree of acidosis
Dosing: ElderlyRefer to adult dosing.
Administration: I.V.The rate of I.V. infusion should not exceed 300 mL/hour of the $^1/_6$ molar injection.
Administration: I.V. DetailpH: 6.0-7.3
CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4$NS, $D_5{}^1/_2$NS, D_5NS, D_5W, D_{10}W, LR, $^1/_2$NS, NS.

Compatibility in syringe: Compatible: Cimetidine.

Compatibility when admixed: Compatible: Lidocaine, nafcillin. **Incompatible:** Sodium bicarbonate.

Pregnancy Risk FactorA
LactationExcretion in breast milk unknown/compatible
Drug Interactions

Amphetamines: Alkalinizing Agents may decrease the excretion of Amphetamines. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringMonitor laboratory results. Support/instruct patient according to purpose for use.
Patient EducationThis medication can only be administered by intravenous infusion. You will be closely monitored during infusion. Inform prescriber of any herbal, OTC, or prescription medications you are taking. Report immediately any sudden chest pain, respiratory difficulty, muscle twitching, or confusion.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion: 18.7 g (1000 mL) [contains sodium 167 mEq and lactate 167 mEq per liter]

Injection, solution [concentrate; preservative free]: 560 mg/mL (10 mL) [contains sodium 5 mEq and lactate 5 mEq per 1 mL]

Generic AvailableYes
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Sodium Nitrite, Sodium Thiosulfate, and Amyl Nitrite

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(SOW dee um NYE trite, SOW dee um thye oh SUL fate, & AM il NYE trite)

U.S. Brand NamesCyanide Antidote Package

Pharmacologic CategoryAntidote

Use: Labeled IndicationsTreatment of cyanide poisoning

Dosing: Adults**Cyanide poisoning:** 0.3 mL ampul of amyl nitrite is crushed every minute and vapor is inhaled for 15-30 seconds until an I.V. sodium nitrite infusion is available. Following administration of 300 mg or 10 mg/kg I.V. sodium nitrite, inject 12.5 g sodium thiosulfate I.V. (over ~10 minutes), if needed; injection of both may be repeated at $^{1}/_{2}$ the original dose.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Cyanide poisoning:** 0.3 mL ampul of amyl nitrite is crushed every minute and vapor is inhaled for 15-30 seconds until an I.V. sodium nitrite infusion is available. Following administration of sodium nitrite I.V. 10 mg/kg (0.33 mL/kg or 6-8 mL/m^2 of a 3% solution; maximum: 10 mL), inject sodium thiosulfate I.V. 7 g/m^2 (maximum: 12.5 g) over ~10 minutes, if needed; injection of both may be repeated at $^{1}/_{2}$ the original dose.

Calculations

- Body Surface Area: Pediatrics

Administration: I.V.

Sodium nitrite: Administer at a rate of 2.5-5 mL/minute.

Sodium thiosulfate: Administer over 10 minutes.

Storage

Amyl nitrite is stable at room temperature. Protect from light. Highly flammable.

Sodium nitrite is stable at room temperature.

Compatibility Do not mix with other medications.

ContraindicationsHypersensitivity to amyl nitrite, sodium nitrite, nitrates, sodium thiosulfate, or any component of the formulation; severe anemia, pregnancy (amyl nitrite)

Warnings/Precautions

Concerns related to adverse effects:

- Methemoglobinemia: Both amyl nitrite and sodium nitrite may induce methemoglobinemia.

Disease-related concerns:

- Cardiovascular disease: Use amyl nitrite with caution in patients with coronary artery disease and patients with hypotension.
- Increased intracranial pressure: Use amyl nitrite with caution in patients with increased intracranial pressure.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Pediatrics: Methemoglobin reductase, which is responsible for converting methemoglobin back to hemoglobin, has reduced activity in pediatric patients. In addition, infants and young children have some proportion of fetal hemoglobin which forms methemoglobin more readily than adult hemoglobin. Therefore, pediatric patients are more susceptible to excessive nitrite-induced methemoglobinemia.

Other warnings/precautions:

- Initiation of treatment: Collection of pretreatment blood cyanide concentrations does not preclude administration and should not delay administration in the emergency management of highly suspected or confirmed cyanide toxicity.
- Return of symptoms: Patients receiving treatment for acute cyanide toxicity must be monitored for return of symptoms for 24-48 hours.
- Smoke inhalation: Use nitrites cautiously in patients with cyanide poisoning related to smoke inhalation because methemoglobinemia and carboxyhemoglobinemia may worsen oxygen-carrying capacity.

Pregnancy Risk FactorC (sodium thiosulfate and sodium nitrite); C (amyl nitrite)

Adverse ReactionsFrequency not defined.

Amyl nitrite:

Cardiovascular: Postural hypotension; cutaneous flushing of head, neck, and clavicular area; tachycardia; palpitation; vasodilation; syncope

Central nervous system: Headache, dizziness, restlessness

Dermatologic: Skin rash (contact dermatitis)

Gastrointestinal: Nausea, vomiting

Hematologic: Hemolytic anemia

Ocular: Increased intraocular pressure

Sodium nitrite:

Cardiovascular: Tachycardia, syncope, cyanosis, hypotension (associated with rapid infusion), flushing

Central nervous system: Dizziness, headache

Gastrointestinal: Nausea, vomiting

Miscellaneous: Methemoglobin formation

Sodium thiosulfate:

Cardiovascular: Hypotension

Central nervous system: Coma, CNS depression secondary to thiocyanate intoxication, psychosis, confusion

Dermatologic: Contact dermatitis

Local: Local irritation

Neuromuscular & skeletal: Weakness

Otic: Tinnitus

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Kit [each kit contains] (Cyanide Antidote Package):

Injection, solution:

Sodium nitrite 300 mg/10 mL (2)

Sodium thiosulfate 12.5 g/50 mL (2)

Inhalant: Amyl nitrite 0.3 mL (12)

[kit also includes disposable syringes, stomach tube, tourniquet, and instructions]

Generic AvailableNo

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, restlessness, confusion, psychosis, and CNS depression

Mental Health: Effects on Psychiatric TreatmentMay cause hypotension and anticholinergic effects; concomitant use with psychotropic agents may produce additive effects; monitor

Index TermsAmyl Nitrite,Sodium Thiosulfate, and Sodium Nitrite; Cyanide Antidote Kit; Sodium Thiosulfate, Sodium Nitrite, and Amyl Nitrite

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(SOW dee um ox i BATE)

U.S. Brand NamesXyrem®

Canadian Brand NamesXyrem®

Pharmacologic CategoryCentral Nervous System Depressant

Use: Labeled IndicationsTreatment of cataplexy and daytime sleepiness in patients with narcolepsy

Dosing: Adults**Narcolepsy:** Oral: Initial: 4.5 g/day, in 2 equal doses; first dose to be given at bedtime after the patient is in bed, and second dose to be given 2.5-4 hours later. Dose may be increased or adjusted in 2-week intervals; average dose: 6-9 g/day (maximum: 9 g/day)

Dosing: ElderlySafety and efficacy have not been studied in patients >65 years.

Dosing: Pediatric**Narcolepsy:** Oral: Children ≥16 years: Refer to adult dosing.

Dosing: Renal ImpairmentAdjustment not necessary; consider sodium content.

Dosing: Hepatic ImpairmentDecrease starting dose to half and titrate doses carefully in patients with liver dysfunction. Elimination half-life significantly longer in patients with Child's Class C liver dysfunction.

Administration: OralTake on an empty stomach; separate last meal (or food) and first dose by several hours; try to take at similar time each day. Doses should be administered while patient is sitting up in bed. Both doses should be prepared prior to bedtime. The first dose is taken at bedtime and the second dose is taken 2.5-4 hours later; an alarm clock may need to be set for the second dose. After taking the dose, patient is to lie down and remain in bed.

Dietary ConsiderationsTake on an empty stomach; separate last meal (or food) and first dose by several hours; try to take at similar time each day.

Xyrem® 500 mg/mL contains sodium 91 mg/mL.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F) in the original bottle and in a safe and secure place (may need to be locked up).

ReconstitutionPrepare both doses prior to bedtime and place safely near bed, out of reach of pets and children. Each dose should be diluted with 2 ounces of water in the child-resistant dosing cups. Once diluted, solutions should be used within 24 hours.

RestrictionsC-I (illicit use); C-III (medical use)

Sodium oxybate oral solution will be available only to prescribers enrolled in the Xyrem® Patient Success Program® and dispensed to the patient through the designated centralized pharmacy (1-866-997-3688). Prior to dispensing the first prescription, prescribers will be sent educational materials to be reviewed with the patient and enrollment forms for the postmarketing surveillance program. Patients must be seen at least every 3 months; prescriptions can be written for a maximum of 3 months (the first prescription may only be written for a 1-month supply).

An FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to sodium oxybate or any component of the formulation; ethanol and other CNS depressants; semialdehyde dehydrogenase deficiency

Warnings/Precautions

Boxed warnings:

- Abuse potential: See “Other warnings/precautions” below.
- Xyrem® Patient Success Program®: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- CNS depression: Patients should be instructed not to engage in hazardous activities requiring mental alertness for at least 6 hours after taking this medication and that CNS effects may carryover to the next day.
- CNS effects: May cause confusion, psychosis, paranoia, hallucinations, agitation, depression and sleepwalking; use caution with history of depression or suicide attempt.
- Incontinence: May cause urinary and/or fecal incontinence.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with heart failure or hypertension; contains significant amounts of sodium.
- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment; contains significant amounts of sodium.

- Respiratory disease: Use with caution with compromised respiratory function; may impair respiratory drive.

Concurrent drug therapy issues:

- Stimulant use: Most patients (~80%) in clinical trials were also treated with stimulants; therefore, an independent assessment of the effects of sodium oxybate is lacking.

Special populations:

- Pediatrics: Safety and efficacy have not been established in patients <16 years of age.

Other warnings/precautions:

- Abuse potential: **[U.S. Boxed Warning]: Sodium oxybate is a CNS depressant with abuse potential; it should not be used with ethanol or other CNS depressants.** Seizures, respiratory depression, decreases in level of consciousness, coma, and death have been reported when used for nonprescription purposes.

- Administration: Due to the rapid onset of CNS depressant effects, doses should be administered only at bedtime and while the patient is sitting up in bed.

- Tolerance/withdrawal: Tolerance to sodium oxybate, or withdrawal following its discontinuation, have not been clearly defined in controlled clinical trials, but have been reported at larger doses used for illicit purposes.

- Xyrem® Patient Success Program®: **[U.S. Boxed Warning]: Sodium oxybate oral solution will be available only to prescribers enrolled in the Xyrem® Patient Success Program® and dispensed to the patient through the designated centralized pharmacy (1-866-997-3688).**

Pregnancy Risk FactorB

Pregnancy ConsiderationsReproduction studies in animals have not shown teratogenic effects. However, there are no well-controlled studies in pregnant women. Use during pregnancy only if clearly needed. Past use during labor and delivery as an anesthetic has shown a slight decrease in Apgar scores due to sleepiness in the neonate.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Dizziness (8% to 37%), headache (9% to 37%), pain (9% to 20%), somnolence (1% to 14%), confusion (3% to 17%), sleep disorder (6% to 14%)

Gastrointestinal: Nausea (8% to 40%), vomiting (2% to 23%), abdominal pain (3% to 11%)

Genitourinary: Urinary incontinence (<1% to 14%, usually nocturnal), enuresis (3% to 17%), cystitis, metrorrhagia, urinary frequency

Miscellaneous: Diaphoresis (3% to 11%)

1% to 10%:

Cardiovascular: Hypertension (6%), chest pain, edema

Central nervous system: Disorientation (up to 9%), inebriation (up to 9%), concentration decreased (3% to 9%), dream abnormality (3% to 9%), sleepwalking (4% to 7%), depression (3% to 6%), amnesia (3% to 6%), anxiety (3% to 6%), thinking abnormality (3% to 6%), lethargy (up to 6%), insomnia (5%), agitation, ataxia, chills, fatigue, malaise, memory impairment, nervousness, pyrexia, seizure, stupor, tremor, vertigo

Dermatologic: Hyperhidrosis (3% to 6%), pruritus, rash

Endocrine & metabolic: Dysmenorrhea (3% to 6%)

Gastrointestinal: Dyspepsia (6% to 9%), diarrhea (6% to 8%), abdominal pain (6%), nausea and vomiting (6%), anorexia, constipation, tooth ache, weight gain

Hepatic: Alkaline phosphatase increased, hypercholesteremia, hypocalcemia

Neuromuscular & skeletal: Hypoesthesia (6%), weakness (6% to 8%), myasthenia (3% to 6%), pain (3% to 6%), arthritis, leg cramps, myalgia

Ocular: Amblyopia (6%), blurred vision (6%)

Otic: Tinnitus (6%), ear pain

Renal: Albuminuria, hematuria

Respiratory: Pharyngitis (6% to 8%), rhinitis (8%), nasopharyngitis (3% to 8%), infection (3% to 6%), bronchitis, cough, dyspnea

Miscellaneous: Infection (3% to 6%), viral infection (3% to 9%), allergic reaction, flu-like syndrome

<1%: Abdominal distension, accident, acne, affect lability, akathisia, ALT increased, allergic reaction, alopecia, anemia, apathy, apnea, arthritis, asthma, AST increased, bilirubinemia, bronchitis, bruising, coma, conjunctivitis, contusion, contact dermatitis, creatinine increased, dehydration, depersonalization, dysgeusia, dysphagia, edema, epistaxis, eructation, euphoria, eye irritation, eye pain, eye redness, eye swelling, fall, fecal incontinence, flatulence, fracture, gastroinesophageal reflux disease, gait abnormal, hangover, hematuria, hiccups, hypersensitivity, hyperuricemia, hyperglycemia, hypernatremia, hypertonia, hypotension, infection, injury, keratoconjunctivitis sicca, laceration, leukocytosis, leukopenia, libido decreased, lymphadenopathy, mental impairment, migraine, miosis, mouth ulceration, myoclonus, neck rigidity, neuralgia, night sweats, paralysis, paranoia, polyarthritis, polycythemia, positive ANA

test, proteinuria, psychomotor activity, restless leg syndrome, rosacea, salivary hypersecretion, sinusitis, snoring, stomatitis, suicidal behavior/thoughts, suicidal attempts, syncope, tachycardia, taste loss, tendonitis, thirst, urinary urgency, urticaria

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (increases CNS depression).

Food: High-fat meal decreases bioavailability, delays absorption, and decreases peak serum level.

Herb/Nutraceutical: Avoid any products that may cause CNS depression (eg, kava kava or valerian).

Monitoring ParametersSigns and symptoms of depression, drug abuse

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (eg, CNS depressants). Assess therapeutic effectiveness and adverse response when beginning therapy and at regular intervals during treatment. Instruct patient (and caregiver) specifics about appropriate preparation and use, side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy without consulting prescriber. Avoid alcohol use. **This medication should only be used by the person it was prescribed for; it is illegal to share with others. Keep in a safe place and prevent access by anyone else.** This medication will cause sleep immediately. It must be taken at bedtime and only after getting in bed. Do not engage in any hazardous activity or one requiring alertness for at least 6 hours after taking. Do not take with food. Both doses should be mixed prior to getting into bed and stored in the containers provided (you may need to set an alarm clock for the second dose). In addition to sleepiness, may cause dizziness or confusion, which carry over into daytime (use extreme caution when driving or engaging in tasks requiring alertness until response to drug is known). May cause nausea, vomiting, loss of appetite, urinary frequency or bedwetting; increased sweating; or acne. Report respiratory difficulty (awake or asleep); CNS changes (abnormal thoughts, loss of consciousness, sleepwalking, amnesia, agitation, or depression, suicidal thoughts, or seizures); skin rash; alternation in menstrual cycle; persistent GI problems; unusual muscle weakness, cramps, or tremor; or other persistent adverse effects. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral:

Xyrem®: 500 mg/mL (180 mL) [contains sodium 91 mg/mL; supplied in a kit containing bottle adapter, two dosing cups, and oral syringe (as measuring device)]

Generic AvailableNo

ManufacturerOrphan Medical, Inc

Mechanism of ActionSodium oxybate is derived from gamma aminobutyric acid (GABA) and acts as an inhibitory chemical transmitter in the brain. May function through specific receptors for gamma hydroxybutyrate (GHB) and GABA (B).

Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: 190-384 mL/kg

Protein binding: <1%

Metabolism: Primarily via the Krebs cycle to form water and carbon dioxide; secondarily via beta oxidation; significant first-pass effect; no active metabolites; metabolic pathways are saturable

Bioavailability: 25%

Half-life elimination: 30-60 minutes

Time to peak: 30-75 minutes

Excretion: Primarily pulmonary (as carbon dioxide); urine (<5% unchanged drug)

Pharmacotherapy PearlsSodium oxybate is a known substance of abuse. When used illegally, it has been referred to as a “date-rape drug”. Street names include Liquid Ecstasy, Liquid X, Liquid E, Georgia Home Boy, Grievous Bodily Harm, G-Riffick, Soap, Scoop, Salty Water, Somatomax, and Organic Quaalude. As part of the FDA approval for prescription use, all patients and prescribers must be enrolled in a program designed to restrict its distribution and to provide postmarketing evaluations. Detailed instructions for the use of sodium oxybate will be provided to the patient and healthcare provider prior dispensing the first dose.

Dental Health Professional ConsiderationsSodium oxybate is a known substance of abuse. When used illegally, it has been referred to as a “date-rape drug”. The dentist should be aware of patients showing signs of CNS depression, as with all other drugs in this class.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Tooth ache (see Dental Comment).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Special Alerts

Sodium Phenylacetate and Sodium Benzoate: FDA Issues Alert on Particulate Matter Found in Admixture - September 2008

The U.S. Food and Drug Administration (FDA) is alerting healthcare professionals of possible particulate matter detected by Ucyclyd Pharma in their Ammonul® injection. The company is advising, to ensure patient safety, that a Millex® Durapore GV 33 mm Sterile Syringe Filter (0.22 micron) be used when injecting Ammonul® into the $D_{10}W$ bag during admixture. This filter should be used regardless of visible particulate matter in the vial. Testing of the filter has confirmed that the filter will remove the particulate matter. Ucyclyd Pharma will be packaging filters with all shipments until further notice. Healthcare providers may contact Ucyclyd Pharma at 1-888-829-2593 or 1-800-900-6389 24 hours/day, 7 days/week with questions or concerns.

Further information may be obtained at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Ammonul

Pronunciation(SOW dee um fen il AS e tate & SOW dee um BENZ oh ate)

U.S. Brand NamesAmmonul®

Pharmacologic CategoryAntidote; Urea Cycle Disorder (UCD) Treatment Agent

Use: Labeled IndicationsAdjunct to treatment of acute hyperammonemia and encephalopathy in patients with urea cycle disorders involving partial or complete deficiencies of carbamyl-phosphate synthetase (CPS), ornithine transcarbamoylase (OTC), argininosuccinate lysase (ASL), or argininosuccinate synthetase (ASS); for use with hemodialysis in acute neonatal hyperammonemic coma, moderate-to-severe hyperammonemic encephalopathy and hyperammonemia which fails to respond to initial therapy

Dosing: AdultsAdminister as a loading dose over 90-120 minutes, followed by an equivalent maintenance infusion given over 24 hours. Dosage based on weight and specific enzyme deficiency; therapy should continue until ammonia levels are in normal range. Repeat loading doses are not recommended due to the prolonged plasma levels.

>20 kg:

CPS and OTC deficiency: Ammonul® 55 mL/m^2 and arginine 10% 2 mL/kg (provides sodium phenylacetate 5.5 g/m^2, sodium benzoate 5.5 g/m^2, and arginine hydrochloride 200 mg/kg)

ASS and ASL deficiency: Ammonul® 55 mL/m^2 and arginine 10% 6 mL/kg (provides sodium phenylacetate 5.5 g/m^2, sodium benzoate 5.5 g/m^2, and arginine hydrochloride 600 mg/kg)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricAdminister as a loading dose over 90-120 minutes, followed by an equivalent maintenance infusion given over 24 hours. Dosage based on weight and specific enzyme deficiency; therapy should continue until ammonia levels are in normal range. Repeat loading doses are not recommended due to the prolonged plasma levels.

≤20 kg:

CPS and OTC deficiency: Ammonul® 2.5 mL/kg and arginine 10% 2 mL/kg (provides sodium phenylacetate 250 mg/kg, sodium benzoate 250 mg/kg, and arginine hydrochloride 200 mg/kg).

ASS and ASL deficiency: Ammonul® 2.5 mL/kg and arginine 10% 6 mL/kg (provides sodium phenylacetate 250 mg/kg, sodium benzoate 250 mg/kg, and arginine hydrochloride 600 mg/kg)

Note: Pending a specific diagnosis in infants, the bolus and maintenance dose of arginine should be 6 mL/kg. If ASS or ASL are excluded as diagnostic possibilities, reduce dose of arginine to 2 mL/kg/day.

>20 kg: Refer to adult dosing.

Dosing: Renal ImpairmentUse with caution; monitor closely.

Dialysis: Ammonia clearance is ~10 times greater with hemodialysis than by peritoneal dialysis or hemofiltration. Exchange transfusion is ineffective.

Dosing: Hepatic ImpairmentUse with caution.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Must be administered via central line; administration via peripheral line may cause burns. Must be diluted prior to administration. In case of extravasation, discontinue infusion and resume at new injection site. Antiemetics may be needed to decrease nausea during infusion. Infuse loading dose over 90-120 minutes; maintenance dose is a continuous infusion.

Administration: I.V. DetailExtravasation may cause skin necrosis. Treatment of extravasation may include aspiration of residual mediation from catheter, limb elevation, intermittent cooling with cold packs.

Dietary ConsiderationsCaloric supplementation and dietary protein restriction should be part of treatment. Caloric intake of >80 cal/kg/day should be attempted.

StoragePrior to dilution, store at room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Following dilution, solution for infusion may be stored at room temperature for up to 24 hours.

ReconstitutionDilute in $D_{10}W$ at ≥25 mL/kg. Per manufacturer, it is now a requirement to use a 0.22 micron filter when injecting the solution into the $D_{10}W$ bag during preparation. The manufacturer recommends a Millex® Durapore GV 33 mm syringe filter (provided).

Compatibility**Compatible** with arginine 10%.

ContraindicationsHypersensitivity to sodium phenylacetate, sodium benzoate, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Nausea/vomiting: May occur; premedication with antiemetics may be required.

Disease-related concerns:

- Edema: Use with caution in patients with sodium retention associated with edema.
- Heart failure: Use with caution in patients with heart failure.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment and/or severe renal insufficiency.

Other warnings/precautions:

- Appropriate use: Administer through a central line; peripheral administration may result in burning. Must be diluted prior to administration; avoid extravasation (may cause necrosis).
- Nonpharmacologic support: Severity of hyperammonemia may require hemodialysis, as well as nutritional management and medical support.

Pregnancy Risk FactorC

Pregnancy ConsiderationsIn animal studies, phenylacetate was shown to cause neurological toxicity. Reproduction studies have not been conducted with this combination.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsNonspecific adverse reactions include: Nervous system disorders (22%); metabolism and nutrition disorders (21%); respiratory, thoracic, and mediastinal disorders (15%); general disorders and injection site reactions (14%); gastrointestinal disorders (13%); blood and lymphatic system disorders (11%); cardiac disorders (9%); skin and subcutaneous tissue disorders (6%); vascular disorders (6%); psychiatric disorders (5%); injury, poisoning, and procedural complications (4%); renal and urinary disorders (4%)

More blood and lymphatic system, and vascular disorders were reported for patients ≤30 days of age; more gastrointestinal disorders were reported for patients >30 days.

>10%: Miscellaneous: Infections (12%)

3% to 10%:

Cardiovascular: Hypotension (4%)

Central nervous system: Mental impairment (6%), seizure (6%), brain edema (5%), fever (5%), agitation (3%), coma (3%)

Endocrine & metabolic: Hyperglycemia (7%), hypokalemia (7%), hyperammonemia (5%), metabolic acidosis (4%), acidosis (3%), hypocalcemia (3%)

Gastrointestinal: Vomiting (9%), diarrhea (3%), nausea (3%)

Genitourinary: Urinary tract infection (3%)

Hematologic: Anemia (4%), disseminated intravascular coagulation (DIC) (3%)

Local: Injection site reaction (3%)

Respiratory: Respiratory distress (3%)

<3%, postmarketing, and/or case reports: Abdominal distention, acute psychosis, acute respiratory distress syndrome, aggression, alkalosis, alopecia, anuria, areflexia, ataxia, atrial rupture, blindness, blood carbon dioxide changes, blood glucose changes, blood pH increased, bradycardia, brain death, brain hemorrhage, brain herniation, brain infarction, cardiac arrest/failure, cardiac output decreased, cardiogenic shock, cardiomyopathy, cardiopulmonary arrest/failure, cerebral atrophy, chest pain, cholestasis, clonus, coagulopathy, confusion, consciousness depressed, dehydration, dyspnea, edema, encephalopathy, fluid overload/retention, flushing, gastrointestinal hemorrhage, hallucinations, hemangioma, hemorrhage, hepatic artery stenosis, hepatic failure, hepatotoxicity, hypercapnia, hyperkalemia, hypernatremia, hypertension, hyperventilation, injection site reaction (blistering, extravasation, hemorrhage), intracranial pressure increased, jaundice, Kussmaul respiration, maculopapular rash, multiorgan failure, nerve paralysis, pancytopenia, pCO2 changes, pericardial effusion, phlebothrombosis, pneumonia aspiration, pneumothorax, pruritus, pulmonary edema, pulmonary hemorrhage, rash, renal failure, respiratory alkalosis/acidosis, respiratory arrest/failure, respiratory rate increased, sepsis, septic shock, subdural hematoma, tetany, thrombocytopenia, thrombosis, tremor, urinary retention, urticaria, weakness

Drug Interactions

Probenecid: May increase the serum concentration of Sodium Phenylacetate. Specifically, probenecid may inhibit the renal transport of the phenylacetylglutamine metabolite of sodium phenylacetate. *Risk C: Monitor therapy*

Probenecid: May increase the serum concentration of Sodium Benzoate. Specifically, probenecid may inhibit the renal transport of the hippuric acid metabolite of sodium benzoate. *Risk C: Monitor therapy*

Monitoring ParametersNeurologic status, plasma ammonia, plasma glutamine, clinical response, serum electrolytes (potassium or bicarbonate supplementation may be required), acid-base balance, infusion site

Reference RangeLong-term target levels (may not be appropriate for every patient):

Plasma ammonia: <40 µmol/L

Plasma glutamine: <1000 µmol/L

Normal plasma levels of alanine, glycine, lysine, arginine (except in arginase deficiency); normal urinary orotate excretion; normal plasma protein concentration

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [concentrate]:

Ammonul®: Sodium phenylacetate 100 mg and sodium benzoate 100 mg per 1 mL (50 mL)

Generic AvailableNo

Mechanism of ActionSodium phenylacetate and sodium benzoate provide alternate pathways for the removal of ammonia through the formation of their metabolites. One mole of sodium phenylacetate removes two moles of nitrogen; one mole of sodium benzoate removes one mole of nitrogen.

Pharmacodynamics/Kinetics

Metabolism: Hepatic and renal; sodium phenylacetate conjugates with glutamine, forming the active metabolite, phenylacetylglutamine (PAG); sodium benzoate combines with glycine to form the active metabolite hippuric acid (HIP)

Excretion: Urine

Pharmacotherapy PearlsUcephan® (sodium phenylacetate and sodium benzoate), was previously available as an oral liquid for chronic treatment of urea cycle disorders. Although no longer commercially available, this combination may be compounded for patients not responsive to or tolerant of other treatments.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSeveral nervous system disorders have been reported. May cause agitation, aggression, confusion, hallucinations, and psychosis.

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsNAPA and NABZ; Sodium Benzoate and Sodium Phenylacetate

English

Jump To Field (Select Field Name)

Pronunciation(SOW dee um fen il BYOO ti rate)

U.S. Brand NamesBuphenyl®

Pharmacologic CategoryUrea Cycle Disorder (UCD) Treatment Agent

Use: Labeled IndicationsAdjunctive therapy in the chronic management of patients with urea cycle disorder involving deficiencies of carbamoylphosphate synthetase, ornithine transcarbamylase, or argininosuccinic acid synthetase

Dosing: Adults**Management of urea cycle disorders:** Powder or tablet: Oral: 9.9-13 g/m^2/day, administered in equally divided amounts with each meal or feeding, 3-6 times daily (maximum dose: 20 g/day)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricOral: **Management of urea cycle disorders:**

Children <20 kg: Powder: 450-600 mg/kg/day, administered in equally divided amounts with each meal or feeding, 3-6 times daily (maximum dose: 20 g/day)

Children ≥20 kg: Powder or tablet: Refer to adult dosing.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: OralPowder should be mixed with food (solid or liquid). When mixed with a liquid, shake lightly prior to use. Excipients may not dissolve. Powder may be given orally or via nasogastric and gastrostomy tube.

Dietary ConsiderationsMust be used in conjunction with a protein-restricted diet and, if indicated, essential amino acid supplementation. Patients requiring calorie supplementation should receive protein-free caloric supplements.

Infants with neonatal-onset ornithine transcarbamylase and carbamoylphosphate synthetase deficiency: Initially limit to a protein intake of approximately 1.6 g/kg/day. May increase (after the first 4 months) to 1.9 g/kg/day if tolerated. Protein tolerance will decrease with decreasing growth rate. Infants from 4 months to 1 year should receive at least 1.4 g/kg/day protein, although 1.7 g/kg/day is advisable. From 1-3 years, protein intake should be at least 1.2 g/kg/day although 1.4 g/kg/day is advisable. Citruline supplementation is recommended at 0.17 g/kg/day or 3.8 g/m^2/day; free-base arginine may be used for mild disease.

Late-onset or infants with neonatal-onset argininosuccinic acid synthetase deficiency: May initially receive age-determined minimal protein allowance; increase as tolerated based on blood glutamine and other amino acid levels.

Argininosuccinic acid synthetase deficiency: Arginine (free base) supplementation is recommended at 0.4-0.7 g/kg/day or 8.8-15.4 g/m^2/day

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). After opening, containers should be kept tightly closed.

ContraindicationsShould not be used in the treatment of acute hyperammonemia

Warnings/Precautions

Concerns related to adverse effects:

- Fluid retention: May cause sodium and fluid retention; use with caution in patients where fluid accumulation may be poorly tolerated, such as in HF, hypertension or renal insufficiency.
- Hyperammonemia: Hyperammonemia and hyperammonemic encephalopathy may still occur while on therapy; hyperammonemia should be managed as a medical emergency.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Restricted sodium intake: Contains sodium 125 mg per gram of sodium phenylbutyrate; use with caution, if at all, in patients who must maintain a low sodium intake.

Dosage form specific issues:

- Tablet formulation: The use of sodium phenylbutyrate tablets in children weighing <20 kg is not recommended.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%: Endocrine & metabolic: Amenorrhea/menstrual dysfunction (23%), acidosis (14%), hypoalbuminemia (11%)

3% to 10%:

Endocrine & metabolic: Alkalosis (7%), hyperchloremia (7%), hypophosphatemia (6%), total protein decreased (3%)

Gastrointestinal: Anorexia/appetite decreased (4%), abnormal taste (3%)

Hematologic: Anemia (9%), leukocytosis (4%), leukopenia (4%), thrombocytopenia (3%)

Hepatic: Alkaline phosphatase increased (6%), transaminases increased (4%)

Miscellaneous: Offensive body odor (3%)

≤2%: Abdominal pain, aplastic anemia, arrhythmia, bruising, constipation, depression, edema, gastritis, headache, hyperbilirubinemia, hypernatremia, hyperphosphatemia, hyperuricemia, hypokalemia, nausea, pancreatitis, peptic ulcer disease, rash, rectal bleeding, renal tubular acidosis, syncope, thrombocytosis, vomiting, weight gain

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersBlood ammonia, arginine, amino acid (branch chain), serum proteins and glutamine concentration; serum electrolytes, CBC with differential, hepatic and renal function tests; urinalysis; monitor for physical signs/symptoms of hyperammonemia (eg, lethargy, ataxia, confusion, vomiting, seizures, and memory impairment)
Reference RangePlasma glutamine <1,000 micro mol/L
Nursing: Physical Assessment/Monitoring**Pregnancy risk factor C** - benefits of use should outweigh possible risks. Note breast-feeding caution.
Monitoring: Lab TestsBlood ammonia, arginine, amino acid (branch chain), serum proteins and glutamine concentration; serum electrolytes, CBC with differential, hepatic and renal function tests; urinalysis
Patient EducationIt is important that patients understand and follow the dietary restrictions required when treating this disorder, the medication must be taken in strict accordance with the prescribed regimen and the patient should avoid altering the dosage without the prescriber's knowledge. The powder formulation has a very salty taste. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablets (Buphenyl)

500 mg (100): $662.18

Mechanism of ActionSodium phenylbutyrate is a prodrug that, when given orally, is rapidly converted to phenylacetate, which is in turn conjugated with glutamine to form the active compound phenylacetylglutamine; phenylacetylglutamine serves as a substitute for urea and is excreted in the urine whereby it carries with it 2 moles of nitrogen per mole of phenylacetylglutamine and can thereby assist in the clearance of nitrogenous waste in patients with urea cycle disorders
Pharmacodynamics/Kinetics

Metabolism: Hepatic and renal: Metabolized to phenylacetate and then to phenylacetylglutamine

Half-life elimination: Phenylbutyrate: 0.8 hours; phenylacetate: 1.3 hours

Time to peak, plasma: Within 1 hour

Excretion: Urine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Abnormal taste.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsAmmonapse

Special Alerts

Acute Phosphate Nephropathy Associated with Prescription and Over-the-Counter [OTC] Oral Sodium Phosphate (OSP) Bowel Cleansing Products - December 12, 2008

The U.S. Food and Drug Administration (FDA) has issued an alert notifying healthcare practitioners and consumers of reports of acute phosphate nephropathy associated with OSP products (eg, over-the-counter products Fleet® Phospho-soda® and prescription products Visicol® and OsmoPrep®) when used as bowel cleansing preparations prior to colonoscopy and other procedures. Acute phosphate nephropathy is associated with calcium-phosphate crystal deposits in the renal tubules and may result in permanent renal dysfunction. Risk factors for acute phosphate nephropathy include age >55 years, hypovolemia, patients with pre-existing renal impairment, bowel obstruction, or active colitis; and patients taking medications that may affect renal perfusion or function (eg, diuretics, ACE Inhibitors, angiotensin receptor blockers, and possibly NSAIDs). Some cases have been reported in patients without apparent risk factors.

The FDA is requiring the manufacturers of the prescription OSP products, Visicol® and OsmoPrep®, to add boxed warnings regarding acute phosphate nephropathy to the product labeling. Additionally, the FDA is requiring the manufacturers to develop and implement a risk management program which will include a Medication Guide and conducting a postmarketing clinical trial to further evaluate the risk of acute kidney injury with these agents. Over-the-counter OSP products should not be used for bowel cleansing, and consumers should only use OSPs for bowel cleansing when prescribed by a healthcare provider. The FDA will also remove bowel cleansing from the professional labeling for all over-the-counter OSPs.

Additional information can be found at: http://www.fda.gov/medwatch/safety/2008/safety08.htm#OSP

Medication Safety Issues

Sound-alike/look-alike issues:

Visicol® may be confused with VESIcare®

Enemas and oral solution are available in pediatric and adult sizes; prescribe by “volume” not by “bottle.”

Pronunciation(SOW dee um FOS fates)

U.S. Brand NamesFleet® Enema Extra® [OTC]; Fleet® Enema for Children [OTC]; Fleet® Enema [OTC]; Fleet® Phospho-soda® EZ-Prep™ [OTC]; Fleet® Phospho-soda® [OTC]; LaCrosse Complete [OTC]; OsmoPrep®; Visicol®

Canadian Brand NamesFleet Enema®; Fleet® Phospho-Soda® Oral Laxative

Pharmacologic CategoryCathartic; Electrolyte Supplement, Oral; Electrolyte Supplement, Parenteral; Laxative, Bowel Evacuant

Use: Labeled Indications

Oral, rectal: Short-term treatment of constipation and to evacuate the colon for rectal and bowel exams

I.V.: Source of phosphate in large volume I.V. fluids and parenteral nutrition; treatment and prevention of hypophosphatemia

Dosing: Adults

Normal requirements elemental phosphorus: Oral:

≥19 years: RDA: 700 mg

Hypophosphatemia: It is difficult to provide concrete guidelines for the treatment of severe hypophosphatemia because the extent of total body deficits and response to therapy are difficult to predict. Aggressive doses of phosphate may result in a transient serum elevation followed by redistribution into intracellular compartments or bone tissue. Intermittent I.V. infusion should be reserved for severe depletion situations (<1 mg/dL in adults); large doses of oral phosphate may cause diarrhea and intestinal absorption may be unreliable. I.V. solutions should be infused slowly. Use caution when mixing with calcium and magnesium, precipitate may form. The following dosages are empiric guidelines. **Note:** 1 mmol phosphate = 31 mg phosphorus; 1 mg phosphorus = 0.032 mmol phosphate

Hypophosphatemia treatment: Doses listed as mmol of phosphate:

Intermittent I.V. infusion: Acute repletion or replacement:

Varying dosages: 0.15-0.3 mmol/kg/dose over 12 hours; may repeat as needed to achieve desired serum level **or**

15 mmol/dose over 2 hours; use if serum phosphorus <2 mg/dL **or**

Low dose: 0.16 mmol/kg over 4-6 hours; use if serum phosphorus level 2.3-3 mg/dL

Intermediate dose: 0.32 mmol/kg over 4-6 hours; use if serum phosphorus level 1.6-2.2 mg/dL

High dose: 0.64 mmol/kg over 8-12 hours; use if serum phosphorus <1.5 mg/dL

Oral: 0.5-1 g elemental phosphorus 2-3 times/day may be used when serum phosphorus level is 1-2.5 mg/dL

Maintenance: Doses listed as mmol of phosphate:

Oral: 50-150 mmol/day in divided doses

I.V.: 50-70 mmol/day

Laxative (Fleet®): Rectal: Contents of one 4.5-ounce enema as a single dose, may repeat

Laxative (Fleet® Phospho-soda®): Oral: Take on an empty stomach; dilute dose with 8 ounces cool water, then follow dose with 8 ounces water; **do not repeat dose within 24 hours**

15-45 mL as a single dose; maximum daily dose: 45 mL

Bowel cleansing prior to colonoscopy:Note: Each dose should be taken with a minimum of 8 ounces of clear liquids. Do not repeat treatment within 7 days. Do not use additional agents, especially sodium phosphate products.

Fleet® Phospho-Soda®: Oral: Prior to procedure (timing of doses determined by prescriber): One dose is equal to 45 mL (2 doses are recommended): Each dose is diluted as follows:

Mix 45 mL with 120 mL clear liquid; drink, then follow with at least 240 mL of clear liquid; **or**

Mix 15 mL with 240 mL clear liquid; drink, then follow with 240 mL clear liquid; repeat every 10 minutes for a total of 45 mL

Visicol®: Oral: Adults: A total of 40 tablets divided as follows:

Evening before colonoscopy: 3 tablets every 15 minutes for 6 doses, then 2 additional tablets in 15 minutes (total of 20 tablets)

3-5 hours prior to colonoscopy: 3 tablets every 15 minutes for 6 doses, then 2 additional tablets in 15 minutes (total of 20 tablets)

OsmoPrep®: A total of 32 tablets divided as follows:

Evening before colonoscopy: 4 tablets every 15 minutes for 5 doses (total of 20 tablets)

3-5 hours prior to colonoscopy: 4 tablets every 15 minutes for 3 doses (total of 12 tablets)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Normal requirements elemental phosphorus: Oral:

0-6 months: Adequate intake: 100 mg/day

6-12 months: Adequate intake: 275 mg/day

1-3 years: RDA: 460 mg

4-8 years: RDA: 500 mg

9-18 years: RDA: 1250 mg

Note: 1 mmol phosphate = 31 mg phosphorus; 1 mg phosphorus = 0.032 mmol phosphate

Hypophosphatemia treatment: Doses listed as mmol of phosphate:

Acute repletion; Intermittent I.V. infusion:

Low dose: 0.08 mmol/kg over 6 hours; use if losses are recent and uncomplicated

Intermediate dose: 0.16-0.24 mmol/kg over 4-6 hours; use if serum phosphorus level 0.5-1 mg/dL

High dose: 0.36 mmol/kg over 6 hours; use if serum phosphorus <0.5 mg/dL

Maintenance: Doses listed as mmol of phosphate:

Oral: 2-3 mmol/kg/day in divided doses

I.V.: 0.5-1.5 mmol/kg/day

Laxative (Fleet®): Rectal:

Children 2-<5 years: One-half contents of one 2.25 oz pediatric enema

Children 5-12 years: Contents of one 2.25 oz pediatric enema, may repeat

Children ≥12 years: Refer to adult dosing.

Laxative (Fleet® Phospho-soda®): Oral: Take on an empty stomach; dilute dose with 8 ounces cool water, then follow dose with 8 ounces water; **do not repeat dose within 24 hours**

Children 5-9 years: 7.5 mL as a single dose; maximum daily dose: 7.5 mL

Children 10-12 years: 15 mL as a single dose; maximum daily dose: 15 mL

Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentUse with caution; ionized inorganic phosphate is excreted by the kidneys. Oral solution is contraindicated in patients with kidney disease.

Administration: I.V. DetailFor intermittent I.V. infusion, dilute at a maximum concentration of 0.12 mmol/mL and infuse over 4-6 hours; maximum rate of infusion: 0.06 mmol/kg/hour

Administration: OralBowel cleansing: Have patient drink ~8 ounces of water with each dose of sodium phosphate (total of 2 quarts/64 ounces); have patient rehydrate before and after colonoscopy

Dietary ConsiderationsShould be taken on an empty stomach with water; a clear liquid diet should be used for 12 hours prior to tablet administration.

Oral solution contains 556 mg (24.17 mEq) sodium/ 5 mL; 20.6 mmol phosphate/5 mL

Oral tablet contains 312 mg (13.6 mEq) sodium/tablet; 336 mg (10.8 mmol phosphate) elemental phosphorus/tablet

Whole cow's milk: 0.29 mmol/mL phosphate; 0.025 mEq/mL sodium; 0.035 mEq/mL potassium

StorageStore at 15°C to 30°C (59°F to 86°F).

Compatibility

Y-site administration: Compatible: Gatifloxacin. **Incompatible:** Ciprofloxacin. **Variable (consult detailed reference):** TPN.

Compatibility when admixed: Variable (consult detailed reference): Calcium chloride, calcium gluconate, ciprofloxacin.

ContraindicationsHypersensitivity to sodium phosphate salts or any component of the formulation; congestive heart failure, hyperparathyroidism, ascites

Enema: Imperforate anus

Intravenous preparation: Diseases with hyperphosphatemia, hypocalcemia, or hypernatremia

Oral preparation: Acute colitis, acute phosphate nephropathy (biopsy proven), bowel obstruction, bowel perforation, congenital megacolon, gastric retention, hypomotility syndromes, ileus, pseudo-obstruction, severe chronic constipation, toxic megacolon, unstable angina

Warnings/Precautions

Concerns related to adverse effects:

- Acute phosphate nephropathy: Acute phosphate nephropathy has been reported (rarely) with use as a colon cleanser prior to colonoscopy. Some cases have resulted in permanent renal impairment (some requiring dialysis). Risk factors for acute phosphate nephropathy may include increased age (>55 years of age), pre-existing renal dysfunction, bowel obstruction, active colitis, or dehydration, and the use of medicines that affect renal perfusion or function (eg, ACE inhibitors, angiotensin receptor blockers, diuretics, and possibly NSAIDs). Other preventive measures may include avoid exceeding maximum recommended doses and concurrent use of other laxatives containing sodium phosphate; encourage patients to drink sufficient quantities of clear fluids during bowel cleansing (eg, electrolyte rehydration solution); obtain baseline and postprocedure labs in patients at risk; consider hospitalization and intravenous hydration during bowel cleansing for patients unable to hydrate themselves (eg, frail patients).

- QT prolongation: Prolongation of the QT interval has been reported (associated with hypokalemia, hypocalcemia); use caution in patients with or at risk for arrhythmias (eg, cardiomyopathy, prolonged QT interval, history of uncontrolled arrhythmias, recent MI) or with concurrent use of other QT prolonging medications.

Disease-related concerns:

- Electrolyte disturbances: Use with caution in patients with pre-existing electrolyte imbalances, dehydration, or risk of electrolyte disturbance (hypocalcemia, hyperphosphatemia, hypernatremia). Correct dehydration prior to using for bowel preparations.

- Inflammatory bowel disease: Use with caution in patients with chronic inflammatory bowel disease; may induce colonic aphthous ulceration. Colitis has been associated with acute phosphate nephropathy.

- Renal impairment: Use with caution in patients with renal impairment; may increase risk for acute phosphate nephropathy.

- Seizure disorder: Use with caution in patients with a history of seizures, those at higher risk of seizures or on medication that lowers seizure threshold.

Special populations:

- Bulimia nervosa patients: Laxatives and purgatives have the potential for abuse by bulimia nervosa patients.

- Debilitated patients: Use with caution in debilitated patients; consider each patient’s ability to hydrate properly.

- Elderly: Use with caution in the elderly; ensure they are able to hydrate themselves if using for bowel preparation.
- Gastric bypass/stapling surgery: Use with caution in patients with gastric bypass or stapling surgery.
- Pediatrics: Safety and efficacy of tablets have not been established in children.

Dosage form specific issues:

- Enemas/oral solutions: Available in pediatric and adult sizes; prescribe by “volume” not by “bottle.”
- Visicol®: Use caution with history of swallowing difficulties or esophageal narrowing. Tablet particles may be seen in the stool.

Other warnings/precautions:

- Bowel evacuation: Appropriate use: If using as a bowel evacuant, correct electrolyte abnormalities before administration. Inadequate fluid intake may lead to excessive fluid loss and hypovolemia. Other oral medications may not be well absorbed when given during bowel evacuation because of rapid intestinal peristalsis.

Geriatric ConsiderationsThe use of laxatives should be limited in the elderly since abuse could lead to fluid/electrolyte deficiencies. Since elderly often have reduced renal function, or disease that could predispose them to adverse effects, caution must be used with parenteral sodium phosphate.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted. Use with caution in pregnant women.
LactationUse caution in nursing women.
Adverse ReactionsFrequency not defined.

Cardiovascular: Edema, hypotension

Central nervous system: Dizziness, headache

Endocrine & metabolic: Hypocalcemia, hypernatremia, hyperphosphatemia, calcium phosphate precipitation

Gastrointestinal: Nausea, vomiting, diarrhea, abdominal bloating, abdominal pain, mucosal bleeding, superficial mucosal ulcerations

Renal: Acute renal failure

Postmarketing and/or case reports: Acute phosphate nephropathy, atrial fibrillation following severe vomiting (tablet formulation); nephrocalcinosis (oral solution)

Drug Interactions

Antacids: May decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: May enhance the hypocalcemic effect of Phosphate Supplements. *Risk C: Monitor therapy*

Calcium Salts: May decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Iron Salts: May decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Sucralfate: May decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Monitoring Parameters

I.V.: Serum calcium and phosphate levels; renal function

Oral: Bowel cleansing: Baseline and post-procedure labs (electrolytes, calcium, phosphate, BUN, creatinine) in patients at risk for acute renal nephropathy, seizure, or who have a history of electrolyte abnormality; ECG in patients with risks for prolonged QT or arrhythmias. Ensure euvolemia before initiating bowel preparation.

Monitoring: Lab TestsI.V.: Serum calcium and phosphate levels; renal function
Patient EducationMay cause diarrhea with the oral preparation; excessive or prolonged use as a laxative may cause dependence. Do not use over-the-counter laxatives when you are nauseated, vomiting, or have abdominal pain, unless directed to by prescriber. Do not use recommended dose more than once in 24 hours. In general, laxative products should not be used for longer than 1 week, unless under guidance of prescriber. Do not use with other laxative products, especially those containing phosphate. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Enemas: Not for oral use. Insert bottle gently into rectum with tip of bottle pointed towards naval; do not force. Squeeze bottle to expel liquid, stop if resistance is felt. Contact prescriber immediately if no liquid is returned following administration, or if rectal bleeding occurs.

Tablets: Undigested or partially-digested tablets of this or other medications may be seen in stool. Take each dose with 8 oz of clear liquids.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Kit [packaged as a two-dose kit which contains]:

Fleet® Phospho-soda® EZ-Prep™:

Solution, oral: Monobasic sodium phosphate monohydrate 2.4 g and dibasic sodium phosphate heptahydrate 0.9 g per 5 mL (30 mL)

[sugar-free; contains sodium 556 mg/5 mL and phosphate 62.25 mEq/5 mL; packaged with lemonade flavor packets which contain phenylalanine]

Solution, oral: Monobasic sodium phosphate monohydrate 2.4 g and dibasic sodium phosphate heptahydrate 0.9 g per 5 mL (45 mL) [sugar-free; contains sodium 556 mg/5 mL and phosphate 62.25 mEq/5 mL; packaged with lemonade flavor packets which contain phenylalanine]

Injection, solution [concentrate; preservative free]: Phosphorus 3 mmol and sodium 4 mEq per 1 mL (5 mL, 15 mL, 50 mL) [equivalent to phosphorus 93 mg and sodium 92 mg per 1 mL; source of electrolytes; monobasic and dibasic sodium phosphate]

Solution, oral: Monobasic sodium phosphate monohydrate 2.4 g and dibasic sodium phosphate heptahydrate 0.9 g per 5 mL (45 mL)

Fleet® Phospho-soda®: Monobasic sodium phosphate monohydrate 2.4 g and dibasic sodium phosphate heptahydrate 0.9 g per 5 mL (45 mL) [sugar free; contains sodium 556 mg/5 mL, sodium benzoate, and phosphate 62.25 mEq/5 mL; unflavored or ginger-lemon flavor]

Solution, rectal [enema]: Monobasic sodium phosphate monohydrate 19 g and dibasic sodium phosphate heptahydrate 7 g per 118 mL delivered dose (133 mL)

Fleet® Enema: Monobasic sodium phosphate monohydrate 19 g and dibasic sodium phosphate heptahydrate 7 g per 118 mL delivered dose (133 mL) [contains sodium 4.4 g/118 mL]

Fleet® Enema Extra®: Monobasic sodium phosphate monohydrate 19 g and dibasic sodium phosphate heptahydrate 7 g per 197 mL delivered dose (230 mL) [contains sodium 4.4 g/197 mL]

Fleet® Enema for Children: Monobasic sodium phosphate monohydrate 9.5 g and dibasic sodium phosphate heptahydrate 3.5 g per 59 mL delivered dose (66 mL) [contains sodium 2.2 g/59 mL]

LaCrosse Complete: Monobasic sodium phosphate monohydrate 19 g and dibasic sodium phosphate heptahydrate 7 g per 118 mL delivered dose (133 mL) [contains sodium 4.4 g/118 mL]

Tablet, oral [scored]:

OsmoPrep®, Visicol®: Monobasic sodium phosphate monohydrate 1.102 g and dibasic sodium phosphate anhydrous 0.398 g [sodium phosphate 1.5 g per tablet; gluten free]

Generic AvailableYes: Enema, injection, oral solution
Pricing: U.S. (www.drugstore.com)

Tablets (OsmoPrep)

1.102-0.398 g (100): $188.30

Tablets (Visicol)

1.102-0.398 g (40): $151.28

Mechanism of ActionAs a laxative, exerts osmotic effect in the small intestine by drawing water into the lumen of the gut, producing distention and promoting peristalsis and evacuation of the bowel; phosphorous participates in bone deposition, calcium metabolism, utilization of B complex vitamins, and as a buffer in acid-base equilibrium
Pharmacodynamics/Kinetics

Onset of action: Cathartic: 3-6 hours; Rectal: 2-5 minutes

Absorption: Oral: ~1% to 20%

Related Information

- Laxatives, Classification and Properties

Pharmacotherapy PearlsPhosphate salts may precipitate when mixed with calcium salts; solubility is improved in amino acid parenteral nutrition solutions; check with a pharmacist to determine compatibility.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Kayexalate® may be confused with Kaopectate®

Always prescribe either one-time doses or as a specific number of doses (eg, 15 g q6h x 2 doses). Scheduled doses with no dosage limit could be given for days leading to dangerous hypokalemia.

International issues:

Kionex™ may be confused with Kinex® which is a brand name for biperiden in Mexico

Pronunciation(SOW dee um pol ee STYE reen SUL fon ate)
U.S. Brand NamesKayexalate®; Kionex®; SPS®
Canadian Brand NamesKayexalate®; PMS-Sodium Polystyrene Sulfonate
Pharmacologic CategoryAntidote
Use: Labeled IndicationsTreatment of hyperkalemia
Dosing: Adults**Hyperkalemia:**

Oral: 15 g 1-4 times/day

Rectal: 30-50 g every 6 hours

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Hyperkalemia:**

Oral: Children: 1 g/kg/dose every 6 hours

Rectal: Children: 1 g/kg/dose every 2-6 hours (in small children and infants, employ lower doses by using the practical exchange ratio of 1 mEq K^+/g of resin as the basis for calculation)

Administration: OralAdminister orally (or NG) as a suspension using the commercially available suspension or the powder for suspension. **Do not mix in orange juice.** Chilling the oral mixture will increase palatability. Shake suspension well prior to administration.

Powder for suspension: For each 1 g of the powdered resin, add 3–4 mL of water or syrup (amount of fluid usually ranges from 20–100 mL)

Administration: OtherRectal: Enema route is less effective than oral administration. Administer cleansing enema first. Retain enema in colon for at least 30-60 minutes and for several hours, if possible. Enema should be followed by irrigation with normal saline to prevent necrosis.
Dietary ConsiderationsDo **not** mix in orange juice. Powder for suspension contains sodium 100 mg/g (4.1 mEq/g). SPS® suspension contains sodium 1500 mg/60 mL (65 mEq/60 mL).
StorageStore prepared suspensions at 15°C to 30°C (59°F to 86°F). Store repackaged product in refrigerator and use within 14 days. Freshly prepared suspensions should be used within 24 hours. Do not heat resin suspension.
ContraindicationsHypersensitivity to sodium polystyrene sulfonate or any component of the formulation; hypernatremia, hypokalemia, obstructive bowel disease
Warnings/Precautions

Concerns related to adverse effects:

- Fecal impaction: Large oral doses may cause fecal impaction (especially in elderly).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe heart failure and/or hypertension.
- Edema: Use with caution in patients with edema.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Neonates: Avoid using the commercially available liquid product in neonates due to the preservative content.

Other warnings/precautions:

- Enema vs. oral administration: Enema will reduce the serum potassium faster than oral administration, but the oral route will result in a greater reduction over several hours.

Geriatric ConsiderationsLarge doses in the elderly may cause fecal impaction and intestinal obstruction. Best to administer using sorbitol 70% as vehicle.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Endocrine & metabolic: Hypernatremia, hypokalemia, hypocalcemia, hypomagnesemia

Gastrointestinal: Anorexia, colonic necrosis (rare), constipation, fecal impaction, intestinal obstruction (due to concretions in association with aluminum hydroxide), nausea, vomiting

Drug Interactions

Antacids: Sodium Polystyrene Sulfonate may enhance the adverse/toxic effect of Antacids. The combined use of these two agents may result in metabolic alkalosis. **Exceptions:** Sodium Bicarbonate. *Risk D: Consider therapy modification*

Monitoring ParametersExchange capacity is 1 mEq/g *in vivo*, and *in vitro* capacity is 3.1 mEq/g, therefore, a wide range of exchange capacity exists such that close monitoring of serum electrolytes (potassium, sodium, calcium, magnesium) is necessary; ECG
Reference RangeSerum potassium: Adults: 3.5-5.2 mEq/L
Nursing: Physical Assessment/MonitoringAssess results of laboratory tests. Monitor ECG until potassium levels are normal. Monitor for adverse reactions and teach patient interventions and importance of reporting adverse symptoms promptly.
Monitoring: Lab TestsSerum electrolytes, calcium, magnesium
Patient EducationEmergency instructions depend on patient's condition. You will be monitored for effects of this medication and frequent blood tests may be necessary. Oral: Take as directed. Mix well with a full glass of liquid (not orange juice). You may experience nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or constipation or fecal impaction (increased dietary fluids and exercise may help). Report persistent constipation or GI distress; chest pain or rapid heartbeat; or mental confusion or muscle weakness. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for suspension, oral/rectal:

Kayexalate®: 15 g/4 level teaspoons (480 g) [contains sodium 100 mg (4.1 mEq)/g]

Kionex®: 15 g/4 level teaspoons (454 g) [contains sodium 100 mg (4.1 mEq)/g]

Suspension, oral/rectal: 15 g/60 mL (60 mL, 120 mL, 200 mL, 500 mL)

SPS®: 15 g/60 mL (60 mL, 120 mL, 480 mL) [contains alcohol 0.3%, sodium 1500 mg (65 mEq)/60 mL, propylene glycol, and sorbitol; cherry flavor]

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Powder (Kayexalate)

(453.6): $317.11

Powder (Kionex)

(454): $148.59

Powder (Sodium Polystyrene Sulfonate)

(454): $132.75

Suspension (Sodium Polystyrene Sulfonate)

15 g/60 mL (60): $14.99

Mechanism of ActionRemoves potassium by exchanging sodium ions for potassium ions in the intestine before the resin is passed from the body
Pharmacodynamics/Kinetics

Onset of action: 2-24 hours

Absorption: None

Excretion: Completely feces (primarily as potassium polystyrene sulfonate)

Related Information

- Antacid Drug Interactions

Pharmacotherapy Pearls1 g of resin binds approximately 1 mEq of potassium
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsWhile Kayexalate® can be used in the treatment of hyperkalemia, if hyperkalemia is associated with ECG changes, more emergent therapy needs to be used (ie, glucose-insulin or calcium). ECG signs of hyperkalemia that require acute interventional measures include peaked T waves, QRS prolongation, and cardiac conduction abnormalities including heart block. Kayexalate® can be used as an additional measure for maintaining control of potassium levels. Note that the mechanism of action consists of an exchange of potassium for sodium, therefore, Kayexalate® should be used with caution in patients with severe heart failure, hypertension, or renal failure. While rectal administration of Kayexalate® achieves a more rapid action, oral administration results in a more sustained potassium reduction.

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: While sodium polystyrene sulfonate can be used in the treatment of hyperkalemia, if hyperkalemia is associated with ECG changes, more emergent therapy needs to be used (ie, glucose-insulin or calcium). Sodium polystyrene sulfonate should be used with caution in patients with severe heart failure, hypertension, or renal failure. While rectal administration of sodium polystyrene sulfonate achieves a more rapid action, oral administration results in a more sustained potassium reduction.

Colonic necrosis is a rare but deadly complication of sodium polystyrene sulfonate-sorbitol when used orally or as an enema in the critically ill patient with hyperkalemia. The clinician should be keenly aware of this devastating side effect and its management. After administration, patients should be closely monitored for abdominal pain, fever, and hypotension. If possible, critically ill patients should receive alternative therapies for potassium removal (eg, hemodialysis).

Sodium Tetradecyl

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(SOW dee um tetra DEK il)

U.S. Brand NamesSotradecol®

Canadian Brand NamesTrombovar®

Pharmacologic CategorySclerosing Agent

Use: Labeled IndicationsTreatment of small, uncomplicated varicose veins of the lower extremities

Dosing: Adults**Sclerosing agent:** I.V.: Test dose: 0.5 mL given several hours prior to administration of larger dose; 0.5-2 mL (preferred maximum: 1 mL) in each vein, maximum: 10 mL per treatment session; 3% solution reserved for large varices

Dosing: ElderlyRefer to adult dosing.

Administration: I.V.Inject slowly.

Administration: I.V. DetailpH 7.9

StorageStore at controlled room temperature.

CompatibilityChemically **incompatible** with heparin.

ContraindicationsHypersensitivity to sodium tetradecyl or any component of the formulation; arterial disease, acute thrombophlebitis; valvular or deep vein incompetence, phlebitis migrans, cellulitis, acute infections; bedridden patients; patients with uncontrolled systemic disease such as diabetes, toxic hyperthyroidism, tuberculosis, asthma, neoplasm, sepsis, blood dyscrasias, and acute respiratory or skin diseases; huge superficial veins with wide open communications to deeper veins; allergic conditions; varicosities caused by abdominal and pelvic tumors (unless tumor has been removed)

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis: Observe for hypersensitivity/anaphylactic reaction; emergency resuscitation equipment should be available.

- Thromboembolism: Deep vein thrombosis (DVT) and pulmonary embolism (PE) have occurred following treatment.

Disease-related concerns:

- Arteriosclerosis: Use with caution in patients with peripheral arteriosclerosis.

- Thromboangiitis obliterans: Use with caution in patients with thromboangiitis obliterans.

Other warnings/precautions:

- Appropriate use: Valvular and venous competency should be evaluated prior to use.

- Extravasation: Avoid extravasation.

Geriatric ConsiderationsDue to possible contraindications with disease states that may be “out of control,” the elderly patient's medical condition must be thoroughly evaluated before use. No specific geriatric data available.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined.

Central nervous system: Headache

Dermatologic: Discoloration at site of injection, sloughing and tissue necrosis following extravasation

Gastrointestinal: Nausea, vomiting

Local: Pain, itching, or ulceration at injection site

Miscellaneous: Allergic reaction (including hives, asthma, hay fever); anaphylactic shock

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersMonitor for DVT or PE (up to 4 weeks after injection)

Nursing: Physical Assessment/MonitoringMonitor for allergic reaction/anaphylaxis. Have resuscitation equipment available. Monitor injection site for extravasation. Can cause sloughing and necrosis of tissue. **Pregnancy risk factor C:** Benefits of use should outweigh possible risks. Note breast-feeding caution.

Patient EducationA permanent discoloration may remain along the site of the injections. You may experience headache, nausea, and vomiting. Report chest pain or shortness of breath immediately. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber before breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, as sulfate:

Sotradecol®: 1% (2 mL) [contains benzyl alcohol]; 3% (2 mL) [contains benzyl alcohol]

Generic AvailableNo

ManufacturerBioniche

Mechanism of ActionActs by irritation of the vein intimal endothelium and causes thrombosis formation leading to occlusion of the injected vein

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsSodium Tetradecyl Sulfate

International Brand NamesFibro Vein (PL); Fibro-Vein (AU, AU, GB, IE, IT, IT, NZ); S.T.D. (ZA); Setrol (IN); Sotradecol (KP); STD (AU); Trombovar (FR, FR, IT, IT, NL, NL)

Sodium Thiosulfate

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(SOW dee um thye oh SUL fate)
U.S. Brand NamesVersiclear™
Pharmacologic CategoryAntidote
Use: Labeled Indications

Parenteral: Used alone or with sodium nitrite or amyl nitrite in cyanide poisoning; reduce the risk of nephrotoxicity associated with cisplatin therapy; treatment of cyanide poisoning due to nitroprusside

Topical: Treatment of tinea versicolor

Use: Unlabeled/InvestigationalManagement of I.V. extravasation
Dosing: Adults

Cyanide poisoning: I.V.: 12.5 g given over 10 minutes; may repeat at $^1/_2$ the original dose if symptoms return.

Cisplatin rescue (should be given before or during cisplatin administration): I.V. infusion (in sterile water): 12 g/m^2 over 6 hours or 9 g/m^2 I.V. push followed by 1.2 g/m^2 continuous infusion for 6 hours

Tinea versicolor: Topical: 20% to 25% solution: Apply a thin layer to affected areas twice daily

Drug extravasation (unlabeled use): SubQ: 1/6 M (~4%) solution: Inject into the affected area; various volumes have also been suggested for direct injection into existing I.V. line; however, the optimal volume and efficacy of such practices have not been thoroughly evaluated. **Note:** Use only for large cisplatin infiltrates (>20 mL) and cisplatin concentrations >0.5 mg/mL.

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Cyanide poisoning: I.V.: 7 g/m^2 (maximum dose: 12.5 g) given over 10 minutes; may repeat at $^1/_2$ the original dose if symptoms return.

Cisplatin rescue (should be given before or during cisplatin administration): I.V. infusion (in sterile water): 12 g/m^2 over 6 hours or 9 g/m^2 I.V. push followed by 1.2 g/m^2 continuous infusion for 6 hours.

Tinea versicolor: Topical: Refer to adult dosing.

Drug extravasation (unlabeled use): Refer to adult dosing.

Administration: I.V.Inject slowly, over at least 10 minutes; rapid administration may cause hypotension
Administration: TopicalDo not apply to or near eyes.
ContraindicationsHypersensitivity to sodium thiosulfate or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Infusion reactions: Rapid I.V. infusion has caused transient hypotension and ECG changes in dogs.

- Thiocyanate intoxication: Can increase risk of thiocyanate intoxication.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; thiocyanate is eliminated by the kidneys.

Special populations:

- Fire victims: Fire victims may present with both cyanide and carbon monoxide poisoning. In this scenario, sodium thiosulfate may be used alone to promote the clearance of cyanide. Sodium thiosulfate does, however, have a slow onset of action.

- Pregnancy: Safety in pregnancy has not been established.

Dosage form specific issues:

- Topical: Discontinue topical use if irritation or sensitivity occurs.

Other warnings/precautions:

- Initiation of treatment: Collection of pretreatment blood cyanide concentrations does not preclude administration and should not delay administration in the emergency management of highly suspected or confirmed cyanide toxicity.

- Return of symptoms: Patients receiving treatment for acute cyanide toxicity must be monitored for return of symptoms for 24-48 hours.

Pregnancy Risk FactorC
Pregnancy ConsiderationsSafety has not been established in pregnant women. Use only when potential benefit to the mother outweighs the possible risk to the fetus.
Adverse ReactionsFrequency not defined

Cardiovascular: Hypotension (infusion rate-dependent)

Dermatologic: Contact dermatitis, local irritation

Gastrointestinal: Nausea, vomiting

Miscellaneous: Hypersensitivity reactions

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Drug InteractionsThere are no known significant interactions.
Monitoring ParametersMonitor for signs of thiocyanate toxicity; monitor for hypotension and hypersensitivity reactions
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: 100 mg/mL (10 mL); 250 mg/mL (50 mL)

Lotion: Sodium thiosulfate 25% and salicylic acid 1% (120 mL) [contains isopropyl alcohol 10%]

Generic AvailableYes: Injection
Pricing: U.S. (www.drugstore.com)

Lotion (Versiclear)

25-1% (120): $19.99

Mechanism of Action

Cyanide toxicity: Accelerates the clearance of cyanide via the rhodanase-catalyzed detoxification of cyanide to thiocyanate (much less toxic than cyanide). The accelerated action of rhodanase is a result of the exogenous sulfur provided by sodium thiosulfate.

Cisplatin toxicity: Complexes with cisplatin to form a compound that is nontoxic to either normal or cancerous cells

Pharmacodynamics/Kinetics

Absorption: Oral: Poor

Distribution: Extracellular fluid

Half-life elimination: 0.65 hour

Excretion: Urine (28.5% as unchanged drug)

Related Information

- Management of Drug Extravasations

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause coma, CNS depression secondary to thiocyanate intoxication, psychosis, or confusion
Mental Health: Effects on Psychiatric TreatmentCNS depressant effect of psychotropics may be potentiated; monitor
Index TermsDisodium Thiosulfate Pentahydrate; Pentahydrate; Sodium Hyposulfate; Sodium Thiosulphate; Thiosulfuric Acid Disodium Salt

Medication Safety Issues

Sound-alike/look-alike issues:

VESIcare® may be confused with Visicol®

Pronunciation(sol i FEN a sin)

U.S. Brand NamesVESIcare®

Pharmacologic CategoryAnticholinergic Agent

Use: Labeled IndicationsTreatment of overactive bladder with symptoms of urinary frequency, urgency, or urge incontinence

Dosing: Adults**Overactive bladder:** Oral: 5 mg/day; if tolerated, may increase to 10 mg/day.

Dosage adjustment with concomitant CYP3A4 inhibitors: Maximum solifenacin dose: 5 mg/day

Dosing: ElderlyBase dosing on renal/hepatic function.

Dosing: Renal ImpairmentUse with caution in reduced renal function; Cl_{cr} <30 mL/minute: Maximum dose: 5 mg/day

Dosing: Hepatic ImpairmentUse with caution in reduced hepatic function:

Moderate (Child-Pugh class B): Maximum dose: 5 mg/day

Severe (Child-Pugh class C): Use is not recommended

Calculations

- Creatinine Clearance: Adults

Administration: OralSwallow tablet whole; administer with liquids; may be taken without regard to food.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at controlled room temperature of 25°C (77°F).

ContraindicationsHypersensitivity to solifenacin or any component of the formulation; urinary retention; gastric retention; uncontrolled narrow-angle glaucoma.

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: May cause drowsiness and/or blurred vision, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Heat prostration: May occur in the presence of increased environmental temperature; use caution in hot weather and/or exercise.

Disease-related concerns:

- Bladder outflow obstruction: Use with caution in patients with bladder outflow obstruction; increased risk of urinary retention.
- Gastrointestinal disease: Use with caution in patients with gastrointestinal obstructive disorders or decreased gastrointestinal motility.
- Glaucoma: Use with caution in patients with controlled (treated) narrow-angle glaucoma; use is contraindicated in uncontrolled narrow-angle glaucoma.
- Hepatic impairment: Use with caution in patients with moderate hepatic impairment (Child-Pugh class B); dosage adjustment is required; use is not recommended in patients with severe hepatic impairment (Child-Pugh class C).
- QT prolongation: Use with caution in patients with a known history of QT prolongation or other risk factors for QT prolongation (eg, concomitant use of medications known to prolong QT interval and/or electrolyte abnormalities).The risk for QT prolongation is dose-related.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment is required for severe renal impairment (Cl_{cr} <30 mL/minute).

Concurrent drug therapy issues:

- High potential for interactions: Patients on potent CYP3A4 inhibitors require the lower dose of solifenacin.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsIn patients with Cl_{cr} <30 mL/minute, doses >5 mg/day are not recommended. Similar safety and effectiveness were observed in elderly and younger patients.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDecreased fetal weight, increased incidence of cleft palate, and delayed physical development were observed in some animal studies. There are no adequate or well-controlled studies in pregnant women. Use during pregnancy only if the benefit to the mother outweighs the potential risk to the fetus.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%: Gastrointestinal: Xerostomia (11% to 28%; dose-related), constipation (5% to 13%; dose-related)

1% to 10%:

Cardiovascular: Edema (≤1%), hypertension (≤1%)

Central nervous system: Headache (3% to 6%), fatigue (1% to 2%), depression (≤1%)

Gastrointestinal: Dyspepsia (1% to 4%), nausea (2% to 3%), upper abdominal pain (1% to 2%)

Genitourinary: Urinary tract infection (3% to 5%), urinary retention (≤1%)

Ocular: Blurred vision (4% to 5%), dry eyes (≤2%)

Respiratory: Cough (≤1%)

Miscellaneous: Influenza (≤2%)

<1%, postmarketing, and/or case reports: Angioneurotic edema, confusion, fecal impaction, gastrointestinal obstruction, hallucination, hypersensitivity, pruritus, QT_c prolongation, rash, torsade de pointes, urticaria

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Solifenacin. *Risk D: Consider therapy modification*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: Grapefruit juice may increase the serum level effects of solifenacin.

Herb/Nutraceutical: St John's wort (*Hypericum*) may decrease the levels/effects of solifenacin.

Monitoring ParametersAnticholinergic effects (eg, fixed and dilated pupils, blurred vision, tremors or dry skin); creatinine clearance (prior to treatment for dosing adjustment); liver function

Nursing: Physical Assessment/MonitoringAssess other prescriptions and OTC medications the patient may be taking to avoid duplications and interactions. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report. Monitor therapeutic response to medication; urination pattern.

Monitoring: Lab TestsCreatinine clearance (prior to treatment for dosing adjustment); liver function tests

Patient EducationMaintain adequate hydration (2-3 L/day) unless instructed to restrict fluid intake by prescriber. This medication may cause dry mouth (sucking on lozenges or hard candy may help). You may be more susceptible to heat prostration due to decreased ability to sweat. Use caution in hot weather (maintain adequate fluids, reduce exercise activity, rest frequently). You may experience constipation (increased exercise, fluids, fruit/fiber may help), nausea, vomiting, blurred vision and dry eyes. Report difficulty, pain, or burning on urination. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber before breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as succinate:

VESIcare®: 5 mg, 10 mg

Generic AvailableNo
ManufacturerAstellas Pharma Technologies Inc
Pricing: U.S. (www.drugstore.com)

Tablets (VESIcare)

5 mg (30): $136.38

10 mg (30): $136.38

Mechanism of ActionInhibits muscarinic receptors resulting in decreased urinary bladder contraction, increased residual urine volume, and decreased detrusor muscle pressure.
Pharmacodynamics/Kinetics

Distribution: V_d: 600 L

Protein binding: ~98% bound primarily to alpha$_1$-acid glycoprotein

Metabolism: Extensively hepatic; via N-oxidation and 4 R-hydroxylation, forms one active and three inactive metabolites; primary pathway for elimination is via CYP3A4

Bioavailability: ~90%

Half-life elimination: 45-68 hours following chronic dosing

Time to peak, plasma: 3-8 hours

Excretion: Urine 69% (<15% as unchanged drug); feces 23%

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). Prolonged xerostomia may contribute to discomfort and dental disease (eg, caries, periodontal disease, and oral candidiasis).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause depression, sedation, or dizziness
Mental Health: Effects on Psychiatric TreatmentDry mouth and constipation are common; concomitant use with psychotropic agents may produce additive effects; monitor. Carbamazepine, phenobarbital, phenytoin, and St John's wort may decrease levels of solifenacin while nefazodone may increase the levels of solifenacin; monitor.
Index TermsSolifenacin Succinate; YM905

Medication Safety Issues

Sound-alike/look-alike issues:

Somatrem may be confused with somatropin

Somatropin may be confused with somatrem, sumatriptan

International issues:

Genotropin® may be confused with Genatropine® which is a brand name for atropine in France

Pronunciation(soe ma TROE pin)

U.S. Brand NamesGenotropin Miniquick®; Genotropin®; Humatrope®; Norditropin®; Norditropin® NordiFlex®; Nutropin AQ®; Nutropin®; Omnitrope™; Saizen®; Serostim®; Tev-Tropin®; Zorbtive®

Canadian Brand NamesHumatrope®; Nutropine®; Nutropin® AQ; Saizen®; Serostim®

Pharmacologic CategoryGrowth Hormone

Use: Labeled Indications

Children:

Treatment of growth failure due to inadequate endogenous growth hormone secretion (Genotropin®, Humatrope®, Norditropin®, Nutropin®, Nutropin AQ®, Omnitrope™, Saizen®, Tev-Tropin®)

Treatment of short stature associated with Turner syndrome (Genotropin®, Humatrope®, Norditropin®, Nutropin®, Nutropin AQ®)

Treatment of Prader-Willi syndrome (Genotropin®)

Treatment of growth failure associated with chronic renal insufficiency (CRI) up until the time of renal transplantation (Nutropin®, Nutropin AQ®)

Treatment of growth failure in children born small for gestational age who fail to manifest catch-up growth by 2 years of age (Genotropin®) or by 2-4 years of age (Norditropin®)

Treatment of idiopathic short stature (nongrowth hormone-deficient short stature) defined by height standard deviation score (SDS) less than or equal to -2.25 and growth rate not likely to attain normal adult height (Genotropin®, Humatrope®, Nutropin®, Nutropin AQ®)

Treatment of short stature or growth failure associated with short stature homeobox gene (SHOX) deficiency (Humatrope®)

Treatment of short stature associated with Noonan syndrome (Norditropin®)

Adults:

HIV patients with wasting or cachexia with concomitant antiviral therapy (Serostim®)

Replacement of endogenous growth hormone in patients with adult growth hormone deficiency who meet both of the following criteria (Genotropin®, Humatrope®, Norditropin®, Nutropin®, Nutropin AQ®, Omnitrope™, Saizen®):

Biochemical diagnosis of adult growth hormone deficiency by means of a subnormal response to a standard growth hormone stimulation test (peak growth hormone ≤5 mcg/L). Confirmatory testing may not be required in patients with congenital/genetic growth hormone deficiency or multiple pituitary hormone deficiencies due to organic diseases.

and

Adult-onset: Patients who have adult growth hormone deficiency whether alone or with multiple hormone deficiencies (hypopituitarism) as a result of pituitary disease, hypothalamic disease, surgery, radiation therapy, or trauma

or

Childhood-onset: Patients who were growth hormone deficient during childhood, confirmed as an adult before replacement therapy is initiated

Treatment of short-bowel syndrome (Zorbtive®)

Use: Unlabeled/InvestigationalInvestigational: Congestive heart failure; pediatric HIV patients with wasting/cachexia (Serostim®); HIV-associated adipose redistribution syndrome (HARS) (Serostim®)

Dosing: Adults

Growth hormone deficiency: Adjust dose based on individual requirements: To minimize adverse events in older or overweight patients, reduced dosages may be necessary. During therapy, dosage should be decreased if required by the occurrence of side effects or excessive IGF-I levels.

Norditropin®: SubQ: Initial dose ≤0.004 mg/kg/day; after 6 weeks of therapy, may increase dose up to 0.016 mg/kg/day

Nutropin®, Nutropin® AQ: SubQ: ≤0.006 mg/kg/day; dose may be increased up to a maximum of 0.025 mg/kg/day in patients <35 years of age, or up to a maximum of 0.0125 mg/kg/day in patients ≥35 years of age

Humatrope®: SubQ: ≤0.006 mg/kg/day; dose may be increased up to a maximum of 0.0125 mg/kg/day

Genotropin®, Omnitrope™: SubQ: Weekly dosage: ≤0.04 mg/kg divided into 6-7 daily doses; dose may be increased at 4- to 8-week intervals to a maximum of 0.08 mg/kg/week

Saizen®: SubQ: ≤0.005 mg/kg/day; dose may be increased to not more than 0.01 mg/kg/day after 4 weeks

Alternate dosing (growth hormone deficiency): SubQ: Initial: 0.2 mg/day (range: 0.15-0.3 mg/day); may increase every 1-2 months by 0.1-0.2 mg/day

Dosage adjustment with estrogen supplementation (growth hormone deficiency): Larger doses of somatropin may be needed for women taking oral estrogen replacement products; dosing not affected by topical products

HARS (unlabeled use): Serostim®: SubQ: Induction: 4 mg once daily at bedtime for 12 weeks; Maintenance: 2 mg or 4 mg every other day at bedtime for 12-24 weeks. **Note:** Every-other-day dosing during induction has also been studied. Although a greater response was seen with daily dosing, it was associated with an increased incidence of adverse events.

HIV patients with wasting or cachexia:

Serostim®: SubQ: 0.1 mg/kg once daily at bedtime (maximum: 6 mg/day). Alternately, patients at risk for side effects may be started at 0.1 mg/kg every other day. Patients who continue to lose weight after 12 weeks should be re-evaluated for opportunistic infections or other clinical events; rotate injection sites to avoid lipodystrophy Adjust dose if needed to manage side effects.

Daily dose based on body weight:

<35 kg: 0.1 mg/kg

35-45 kg: 4 mg

45-55 kg: 5 mg

>55 kg: 6 mg

Short-bowel syndrome:*Zorbtive®:* SubQ: 0.1 mg/kg once daily for 4 weeks (maximum: 8 mg/day)

Fluid retention (moderate) or arthralgias: Treat symptomatically or reduce dose by 50%

Severe toxicity: Discontinue therapy for up to 5 days; when symptoms resolve, restart at 50% of dose. If severe toxicity recurs or does not disappear within 5 days after discontinuation, permanently discontinue treatment.

Dosing: ElderlyPatients ≥65 years of age may be more sensitive to the action of growth hormone and more prone to adverse effects; in general, dosing should be cautious, beginning at low end of dosing range.

Dosing: Pediatric

Growth hormone deficiency:

Genotropin®, Omnitrope™: SubQ: Weekly dosage: 0.16-0.24 mg/kg divided into 6-7 daily doses

Humatrope®: I.M., SubQ: Weekly dosage: 0.18 mg/kg; maximum replacement dose: 0.3 mg/kg/week; dosing should be divided into equal doses given 3 times/week on alternating days, 6 times/week, or daily

Norditropin®: SubQ: 0.024-0.034 mg/kg/day, 6-7 times/week

Nutropin®, Nutropin® AQ: SubQ: Weekly dosage: 0.3 mg/kg divided into daily doses; pubertal patients: ≤0.7 mg/kg/week divided daily

Tev-Tropin®: SubQ: Up to 0.1 mg/kg administered 3 times/week

Saizen®: I.M., SubQ: 0.18 mg/kg/week in divided doses administered daily **or** as 0.06 mg/kg/dose administered 3 times/week **or** as 0.03 mg/kg/dose administered 6 times/week

Note: Therapy should be discontinued when patient has reached satisfactory adult height, when epiphyses have fused, or when the patient ceases to respond. Growth of 5 cm/year or more is expected, if growth rate does not exceed 2.5 cm in a 6-month period, double the dose for the next 6 months; if there is still no satisfactory response, discontinue therapy

Chronic renal insufficiency (CRI):*Nutropin®, Nutropin® AQ:* SubQ: Weekly dosage: 0.35 mg/kg divided into daily injections; continue until the time of renal transplantation

Dosage recommendations in patients treated for CRI who require dialysis:

Hemodialysis: Administer dose at night prior to bedtime or at least 3-4 hours after hemodialysis to prevent hematoma formation from heparin

CCPD: Administer dose in the morning following dialysis

CAPD: Administer dose in the evening at the time of overnight exchange

Turner syndrome:

Genotropin®: SubQ: Weekly dosage: 0.33 mg/kg divided into 6-7 doses

Humatrope®, Nutropin®, Nutropin® AQ: SubQ: Weekly dosage: ≤0.375 mg/kg divided into equal doses 3-7 times per week

Norditropin®: Up to 0.067 mg/kg/day

Prader-Willi syndrome:*Genotropin®:* SubQ: Weekly dosage: 0.24 mg/kg divided into 6-7 doses

Small for gestational age:

Genotropin®: SubQ: Weekly dosage: 0.48 mg/kg divided into 6-7 doses

Norditropin®: SubQ: Up to 0.067 mg/kg/day

Alternate dosing (small for gestational age): In older/early pubertal children or children with very short stature, consider initiating therapy at higher doses (0.067 mg/kg/day) and then consider reducing the dose (0.033 mg/kg/day) if substantial catch-up growth observed. In younger children (<4 years) with less severe short stature, consider initiating therapy with lower doses (0.033 mg/kg/day) and then titrating the dose upwards as needed.

Idiopathic short stature:

Gentropin®: SubQ: Weekly dosage: 0.47 mg/kg divided into equal doses 6-7 times per week

Humatrope®: SubQ: Weekly dosage: 0.37 mg/kg divided into equal doses 6-7 times per week

Nutropin®, Nutropin AQ®: SubQ: Weekly dosage: Up to 0.3 mg/kg divided into daily doses

SHOX deficiency:*Humatrope®:* SubQ: 0.35 mg/kg/week divided into equal daily doses

HIV patients with wasting or cachexia (unlabeled use):*Serostim®:* SubQ: Limited data; doses of 0.04 mg/kg/day were reported in five children, 6-17 years of age; doses of 0.07 mg/kg/day were reported in six children, 8-14 years of age

Noonan syndrome:*Norditropin®:* SubQ: Up to 0.066 mg/kg/day

Dosing: Renal ImpairmentReports indicate patients with chronic renal failure tend to have decreased clearance; specific dosing suggestions not available

Dosing: Hepatic ImpairmentClearance may be reduced in patients with severe hepatic dysfunction; specific dosing suggestions are not available.

Administration: I.M.Not all products are approved for I.M. administration. Rotate administration sites to avoid tissue atrophy. When administering Humatrope® for growth hormone deficiency, SubQ route is preferred

Administration: OtherDo not shake; administer SubQ or I.M. (not all products are approved for I.M. administration). Rotate administration sites to avoid tissue atrophy. When administering to newborns, reconstitute with sterile water for injection. Norditropin® cartridge must be administered using the corresponding color-coded NordiPen® injection pen. Solution in the Omnitrope™ cartridges must be administered using the Omnitrope™ pen; when installing a new cartridge, prime pen prior to first use. When administering Humatrope® for growth hormone deficiency, SubQ route is preferred. When administering Tev-Tropin®, SubQ injections of solutions >1 mL not recommended.

Dietary Considerations

Prader-Willi syndrome: All patients should have effective weight control (use is contraindicated in severely-obese patients).

Short-bowel syndrome: Intravenous parenteral nutrition requirements may need reassessment as gastrointestinal absorption improves.

Storage

Genotropin®: Store at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light. Following reconstitution of 5.8 mg and 13.8 mg cartridge, store under refrigeration and use within 21 days.

Genotropin® Miniquick®: Store in refrigerator prior to dispensing, but may be stored ≤25°C (77°F) for up to 3 months after dispensing. Once reconstituted, solution must be refrigerated and used within 24 hours. Discard unused portion.

Humatrope®:

Vial: Before and after reconstitution, store at 2°C to 8°C (36°F to 46°F); do not freeze. When reconstituted with provided diluent or bacteriostatic water for injection, use within 14 days. When reconstituted with sterile water for injection, use within 24 hours and discard unused portion.

Cartridge: Before and after reconstitution, store at 2°C to 8°C (36°F to 46°F); do not freeze. Following reconstitution with provided diluent, stable for 28 days under refrigeration.

Norditropin®: Store at 2°C to 8°C (36°F to 46°F); do not freeze. Avoid direct light.

Cartridge: When refrigerated, must be used within 4 weeks once inserted into pen. Orange cartridges (5 mg/1.5 mL) may also be stored up to 3 weeks at ≤25°C (77°F).

Prefilled pen: When refrigerated, must be used within 4 weeks after initial injection. Orange and blue prefilled pens may also be stored up to 3 weeks at ≤25°C (77°F).

Nutropin®: Before and after reconstitution, store at 2°C to 8°C (36°F to 46°F); do not freeze.

Vial: Use reconstituted vials within 14 days. When reconstituted with sterile water for injection, use immediately and discard unused portion.

AQ formulation: Use within 28 days following initial use.

Omnitrope™:

Powder for injection: Prior to reconstitution, store under refrigeration at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light. Reconstitute with provided diluent. Swirl gently; do not shake. Following reconstitution with the provided diluents, the 5.8 mg vial may be stored under refrigeration for up to 3 weeks. Store vial in carton to protect from light.

Solution: Prior to use, store under refrigeration at 2°C to 8°C (36°F to 46°F). Once the cartridge is loaded into the pen delivery system, store under refrigeration for up to 21 days after first use.

Saizen®: Prior to reconstitution, store at room temperature 15°C to 30°C (59°F to 86°F). Following reconstitution with bacteriostatic water for injection, reconstituted solution should be refrigerated and used within 14 days. When reconstituted with sterile water for injection, use immediately and discard unused portion. The Saizen® easy click cartridge, when reconstituted with the provided bacteriostatic water, should be stored under refrigeration and used within 21 days.

Serostim®: Prior to reconstitution, store at room temperature 15°C to 30°C (59°F to 86°F). When reconstituted with sterile water for injection, use immediately and discard unused portion.

Tev-Tropin®: Prior to reconstitution, store at 2°C to 8°C (36°F to 46°F). Following reconstitution with bacteriostatic NS, solution should be refrigerated and used within 14 days. Some cloudiness may occur; do not use if cloudiness persists after warming to room temperature.

Zorbtive®: Store unopened vials and diluent at room temperature of 15°C to 30°C (59°F to 86°F). Store reconstituted vial under refrigeration at 2°C to 8°C (36°F to 46°F) for up to 14 days; do not freeze.

Reconstitution

Genotropin®: Reconstitute with diluent provided.

Genotropin MiniQuick®: Reconstitute with diluent provided. Consult the instructions provided with the reconstitution device.

Humatrope®:

Cartridge: Consult HumatroPen™ User Guide for complete instructions for reconstitution. **Do not use diluent provided with vials.**

Vial: 5 mg: Reconstitute with 1.5-5 mL diluent provided. Swirl gently, do not shake.

Nutropin®: Vial:

5 mg: Reconstitute with 1-5 mL bacteriostatic water for injection. Swirl gently, do not shake.

10 mg: Reconstitute with 1-10 mL bacteriostatic water for injection. Swirl gently, do not shake.

Omnitrope™ powder: Reconstitute with provided diluent. Swirl gently; do not shake.

Saizen®: Vial:

5 mg: Reconstitute with 1-3 mL bacteriostatic water for injection or sterile water for injection. Gently swirl; do not shake.

8.8 mg: Reconstitute with 2-3 mL bacteriostatic water for injection or sterile water for injection. Gently swirl; do not shake.

Serostim®: Vial: Reconstitute with 0.5-1 mL sterile water for injection.

Tev-Tropin®: Reconstitute with 1-5 mL of diluent provided. Gently swirl; do not shake. May use preservative-free NS for use in newborns.

Zorbtive®: 8.8 mg vial: Reconstitute with 1-2 mL bacteriostatic water for injection. Swirl gently.

Contraindications

Hypersensitivity to growth hormone or any component of the formulation; growth promotion in pediatric patients with closed epiphyses; progression of any underlying intracranial lesion or actively growing intracranial tumor; acute critical illness due to complications following open heart or abdominal surgery; multiple accidental trauma or acute respiratory failure; evidence of active malignancy; active proliferative or severe nonproliferative diabetic retinopathy; use in patients with Prader-Willi syndrome **without** growth hormone deficiency (except Genotropin®) or in patients with Prader-Willi syndrome **with** growth hormone deficiency who are severely obese or have severe respiratory impairment

Warnings/Precautions

Concerns related to adverse effects:

- Fluid retention: May occur frequently in adults during use; manifestations of fluid retention (eg, edema, arthralgia, myalgia, nerve compression syndromes/paresthesias) are generally transient and dose dependent.

- Intracranial hypertension (IH): With headache, nausea, papilledema, visual changes, and/or vomiting has been reported with growth hormone product, funduscopic examinations are recommended. Patients with Turner syndrome, chronic renal failure and Prader-Willi syndrome may be at increased risk for IH.

- Neoplasm: Use in contraindicated with active malignancy. Monitor patients with preexisting tumors or growth failure secondary to an intracranial lesion for recurrence or progression of underlying disease.

- Progression of scoliosis: May occur in children experiencing rapid growth.

- Slipped capital epiphyses: Patients with growth hormone deficiency may develop slipped capital epiphyses more frequently; evaluate any child with new onset of a limp or with complaints of hip or knee pain.

Disease-related concerns:

- Acute critical illness: Initiation of somatropin is contraindicated with acute critical illness due to complications following open heart or abdominal surgery, multiple accidental trauma, or acute respiratory failure; mortality may be increased. The safety of continuing somatropin in patients who develop these illnesses during therapy has not been established; use with caution

- Diabetes: Use with caution in patients with diabetes or with risk factors for impaired glucose tolerance; may decrease insulin sensitivity.

- Hypothyroidism: Untreated/undiagnosed hypothyroidism may decrease response to therapy.

- Noonan syndrome: Safety and efficacy have not been established for the treatment of Noonan syndrome in children with significant cardiac disease.

- Prader-Willi syndrome: Fatalities have been reported in pediatric patients with Prader-Willi syndrome following the use of growth hormone. The reported fatalities occurred in patients with one or more risk factors, including severe obesity, sleep apnea, respiratory impairment, or unidentified respiratory infection; male patients with one or more of these factors may be at greater risk. Treatment interruption is recommended in patients who show signs of upper airway obstruction, including the onset of, or increased, snoring. In addition, evaluation of and/or monitoring for sleep apnea and respiratory infections are recommended.

- Turner syndrome: Patients with Turner syndrome are at increased risk for otitis media and other ear/hearing disorders, cardiovascular disorders (including stroke, aortic aneurysm, hypertension), and thyroid disease, monitor carefully

Concurrent therapy issues:

- Glucocorticoids: Concurrent glucocorticoid therapy may inhibit growth promotion effects; may require dosage adjustment or replacement glucocorticoid therapy in patients with ACTH deficiency.

Special populations:

- HIV patients: Patients with HIV infection should be maintained on antiretroviral therapy to prevent the potential increase in viral replication.

Dosage form specific issues:

- Benzyl alcohol: Products may contain benzyl alcohol which has been associated with "gasping syndrome" in neonates; when administering to newborns, reconstitute with sterile water or saline for injection.

- M-cresol: Some products may contain m-cresol as a preservative.

Other warnings/precautions:

- Administration: Not for I.V. injection.

Pregnancy Risk FactorB/C (depending upon manufacturer)
Pregnancy ConsiderationsReproduction studies have not been conducted with all agents. Teratogenic effects were not observed in animal studies. During normal pregnancy, maternal production of endogenous growth hormone decreases as placental growth hormone production increases. Data with somatropin use during pregnancy is limited.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

Growth hormone deficiency: Adverse reactions reported with growth hormone deficiency vary greatly by age. Generally, percentages are less in pediatric patients than adults, and many of the reactions reported in adults are dose related. Percentages reported also vary by product. Below is a listing by age group; events reported more commonly overall are noted with an asterisk (*).

Children: Antibodies development, arthralgia, edema, eosinophilia, glycosuria, Hb A_{1c} increased, headache, hematoma, hematuria, hyperglycemia (mild), hypertriglyceridemia, hypoglycemia, hypothyroidism, injection site reaction, leg pain, lipoatrophy, muscle pain, psoriasis exacerbation, rash, seizure, weakness

Adults: Arthralgia*, back pain, bronchitis, carpal tunnel syndrome, chest pain, depression, diaphoresis, dizziness, edema*, fatigue, flu-like syndrome*, glucose intolerance, glucosuria, headache*, hyperglycemia (mild), hypertension, hypoesthesia, hypothyroidism, infection, insomnia, leg edema, muscle pain, myalgia*, nausea, pain in extremities, paresthesia*, peripheral edema*, rhinitis, skeletal pain*, stiffness in extremities, upper respiratory tract infection, weakness

Additional/postmarketing reactions observed with growth hormone deficiency: Gynecomastia, increased growth of pre-existing nevi, pancreatitis

HARS: Serostim®: Limited to >10%: Edema (peripheral) (19% to 45%), arthralgia (28% to 37%), pain (extremity) (5% to 19%), hypoesthesia (9% to 15%), headache (4% to 14%), blood glucose increased (4% to 14%), paresthesia (11% to 13%), myalgia (3% to 13%)

Idiopathic short stature: Percentages reported using Humatrope® versus placebo: Myalgia (24%), scoliosis (19%), otitis media (16%), arthralgia (11%), arthrosis (11 %), hyperlipidemia (8%), gynecomastia (5%), hip pain (3%), hypertension (3%). Additional adverse reactions listed as reported using other products from ISS NCGS Cohort (frequencies <1%): Aggressiveness, benign intracranial hypertension, diabetes, edema, hair loss, headache, injection site reaction

Prader-Willi syndrome: Genotropin® (frequency not defined): Aggressiveness, arthralgia, edema, hair loss, headache, benign intracranial hypertension, myalgia; fatalities associated with use in this population have been reported

Turner syndrome: Percentages reported using Humatrope® compared to untreated patients. Additional adverse reactions reported from other products, frequency not specified: Surgical procedures (45%), otitis media (43%), ear disorders (18%), hypothyroidism (14%), nevi increased (11%), peripheral edema (7%), joint pain, respiratory illness, urinary tract infection

HIV patients with wasting or cachexia: Serostim® (limited to ≥5%): Musculoskeletal disorders (arthralgia, arthrosis, myalgia: 78%), peripheral edema (26%), headache (13%), nausea (9%), paresthesia (8%), edema (6%), gynecomastia (6%), hypoesthesia (5%)

Short-bowel syndrome: Zorbtive® (limited to >10%): Peripheral edema (69% to 81%), facial edema (44% to 50%), arthralgia (31% to 44%), nausea (13% to 31%), injection site pain (up to 31%), flatulence (25%), injection site reaction (19% to 25%), abdominal pain (13% to 25%), vomiting (19%), pain (6% to 19%), chest pain (up to 19%), dehydration (up to 19%), infection (up to 19%), rhinitis (up to 19%), hearing symptoms (13%), dizziness (6% to 13%), rash (6% to 13%), diaphoresis (up to 13%), generalized edema (up to 13%), malaise (up to 13%), moniliasis (up to 13%), myalgia (up to 13%)

SHOX deficiency: Humatrope®: Arthralgia (11%), gynecomastia (8%), excessive cutaneous nevi (7%), scoliosis (4%)

Small for gestational age: Genotropin® (frequency not defined): Mild, transient hyperglycemia; benign intracranial hypertension (rare); central precocious puberty; jaw prominence (rare); aggravation of pre-existing scoliosis (rare); injection site reactions; progression of pigmented nevi

Drug Interactions

Antidiabetic Agents: Somatropin may diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Cortisone: Somatropin may diminish the therapeutic effect of Cortisone. Growth hormone may reduce the conversion of cortisone to the active cortisol metabolite. *Risk D: Consider therapy modification*

Estrogen Derivatives: May diminish the therapeutic effect of Somatropin. Shown to be a concern with oral hormone replacement therapy in postmenopausal women. **Exceptions:** Ethinyl Estradiol; Mestranol. *Risk D: Consider therapy modification*

PredniSONE: Somatropin may diminish the therapeutic effect of PredniSONE. Growth hormone may reduce the conversion of prednisone to the active prednisolone metabolite. *Risk D: Consider therapy modification*

Monitoring ParametersGrowth curve, periodic thyroid function tests, bone age (annually), periodical urine testing for glucose, somatomedin C (IGF-I) levels; funduscopic examinations at initiation of therapy and periodically during treatment; serum phosphorus, alkaline phosphatase and parathyroid hormone. If growth deceleration is observed in children treated for growth hormone deficiency, and not due to other causes, evaluate for presence of antibody formation. Strict blood glucose monitoring in patients with diabetes. Progression or recurrence of pre-existing tumors or malignant transformation of skin lesions.

CRI: Progression of renal osteodystrophy

Prader-Willi syndrome: Monitor for sleep apnea, respiratory infections, snoring (onset of or increased)

Turner syndrome: Ear disorders including otitis media; cardiovascular disorders

Noonan syndrome: Prior to use, verify short stature syndrome.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness (according to purpose for use), and adverse reactions Perform funduscopic examinations at initiation of therapy and periodically during treatment; Instruct patients with diabetes to monitor glucose levels closely (may induce insulin intolerance). Instruct patient in proper use if self-administered (storage, reconstitution, injection techniques, and syringe/needle disposal), possible side effects/appropriate interventions, and adverse symptoms to report. Pediatrics: Monitor growth curve: annually determine bone age.

Monitoring: Lab TestsPeriodic thyroid function tests, periodical urine testing for glucose, somatomedin C (IGF-I) levels; serum phosphorus, alkaline phosphatase and parathyroid hormone. If growth deceleration is observed in children treated for growth hormone deficiency, and not due to other causes, evaluate for presence of antibody formation. Strict blood glucose monitoring in patients with diabetes.

Patient EducationThis drug can only be administered by injection. If self-administered, you will be instructed by prescriber on proper storage, reconstitution, injection technique, and syringe/needle disposal. Do not shake. Rotate injection sites. Use exactly as prescribed; do not discontinue or alter dose without consulting prescriber. Report immediately any pain, redness, burning, drainage, or swelling at injection site. If you have diabetes, monitor glucose levels closely; this medication may cause an alteration in your insulin levels. May cause side effects which are particular to purpose for use and formulation prescribed; your prescriber will instruct you in particular side effects for your medication. Report immediately unusual or persistent bleeding, excessive fatigue or swelling (edema) of extremities, joint or muscle pain or headache, nausea or vomiting, personality changes, or other persistent adverse effects. **Pregnancy/breast-feeding precaution:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [rDNA origin]:

Genotropin®: 5.8 mg [~15 int. units/mL; delivers 5 mg/mL; contains m-cresol]; 13.8 mg [~36 int. units/mL; delivers 12 mg/mL; contains m-cresol]

Genotropin Miniquick® [preservative free]: 0.2 mg, 0.4 mg, 0.6 mg, 0.8 mg, 1 mg, 1.2 mg, 1.4 mg, 1.6 mg, 1.8 mg, 2 mg [each strength delivers 0.25 mL]

Humatrope®: 5 mg [15 int. units], 6 mg [18 int. units], 12 mg [36 int. units], 24 mg [72 int. units]

Nutropin®: 5 mg [~15 int. units; packaged with diluent containing benzyl alcohol]; 10 mg [~30 int. units; packaged with diluent containing benzyl alcohol]

Omnitrope™: 5.8 mg [~17.4 int. units; packaged with diluent containing benzyl alcohol]

Saizen®: 5 mg [~15 int. units; contains sucrose 34.2 mg; packaged with diluent containing benzyl alcohol]; 8.8 mg [~26.4 int. units; contains sucrose 60.2 mg; packaged with diluent containing benzyl alcohol]

Serostim®: 4 mg [~12 int. units; contains sucrose 27.3 mg; packaged with diluent containing benzyl alcohol; 5 mg [~15 int. units; contains sucrose 34.2 mg]; 6 mg [~18 int. units; contains sucrose 41 mg]; 8.8 mg [~26.4 int. units; contains sucrose 60.19 mg; packaged with diluent containing benzyl alcohol]

Tev-Tropin®: 5 mg [15 int. units/mL; packaged with diluent containing benzyl alcohol]

Zorbtive®: 8.8 mg [~26.4 int. units; contains sucrose 60.19 mg; packaged with diluent containing benzyl alcohol]

Injection, solution [rDNA origin]:

Norditropin®: 5 mg/1.5 mL (1.5 mL); 15 mg/1.5 mL (1.5 mL)

Norditropin® NordiFlex®: 5 mg/1.5 mL (1.5 mL); 10 mg/1.5 mL (1.5 mL); 15 mg/1.5 mL (1.5 mL)

Nutropin AQ®: 5 mg/mL (2 mL) [~15 int. units/mL]

Omnitrope™: 5 mg/1.5 mL (1.5 mL); 10 mg/1.5 mL (1.5 mL)

5 mg (1): $211.84

Mechanism of ActionSomatropin is a purified polypeptide hormones of recombinant DNA origin; somatropin contains the identical sequence of amino acids found in human growth hormone; human growth hormone stimulates growth of linear bone, skeletal muscle, and organs; stimulates erythropoietin which increases red blood cell mass; exerts both insulin-like and diabetogenic effects; enhances the transmucosal transport of water, electrolytes, and nutrients across the gut

Pharmacodynamics/Kinetics

Duration: Maintains supraphysiologic levels for 18-20 hours

Absorption: I.M., SubQ: Well absorbed

Distribution: ~1 L/kg

Metabolism: Hepatic and renal (~90%)

Bioavailability: SubQ: ~70% to 90%

Half-life elimination: Preparation and route of administration dependent; SubQ: ~2-4 hours

Excretion: Urine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause aggression (in pediatric patients with Prader-Willi syndrome)

Mental Health: Effects on Psychiatric TreatmentContraindicated in pediatric patients with Prader-Willi syndrome who are severely obese or have severe respiratory impairment; fatalities have been reported.

Index TermshGH; Human Growth Hormone; Somatrem

Medication Safety Issues

Sound-alike/look-alike issues:

Nexavar® may be confused with Nexium®

Sorafenib may be confused with sunitinib

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(sor AF e nib)
U.S. Brand NamesNexavar®
Canadian Brand NamesNexavar®
Pharmacologic CategoryAntineoplastic Agent, Tyrosine Kinase Inhibitor; Vascular Endothelial Growth Factor (VEGF) Inhibitor
Use: Labeled IndicationsTreatment of advanced renal cell cancer (RCC), unresectable hepatocellular cancer (HCC)
Use: Unlabeled/InvestigationalTreatment of advanced thyroid cancer
Dosing: Adults

Advanced renal cell carcinoma: Oral: 400 mg twice daily

Hepatocellular cancer: Oral: 400 mg twice daily

Thyroid cancer (unlabeled use): 400 mg twice daily (Gupta-Abramson, 2008)

Dosage adjustment for concomitant CYP3A4 inducers: Avoid the concomitant use of a strong CYP3A4 inducer (eg, carbamazepine, dexamethasone, phenobarbital, phenytoin, rifampin, St. John's wort) with sorafenib. If a strong CYP3A4 inducer is required, the sorafenib dose may need to be increased, with careful monitoring. When the strong CYP3A4 inducer is discontinued, reduce sorafenib to the indicated dose.

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNo adjustment is required for mild, moderate, or severe renal impairment (not dependant on dialysis); has not been studied in dialysis patients.
Dosing: Hepatic ImpairmentNo adjustment required for mild (Child-Pugh class A) to moderate (Child-Pugh class B) hepatic impairment; not studied in severe hepatic impairment (Child-Pugh class C). Use with extreme caution in patients with HCC with elevated bilirubin levels.
Dosing: Adjustment for ToxicityTemporary interruption and/or dosage reduction may be necessary for management of adverse drug reactions. The dose may be reduced to 400 mg once daily and then further reduced to 400 mg every other day.

Dose modification for severe/persistent hypertension (despite antihypertensive therapy) or cardiac ischemia/infarction: Consider temporarily or permanently discontinuing treatment.

Dose modification for hemorrhage requiring medical intervention or gastrointestinal perforation: Consider permanently discontinuing treatment.

Dose modification for skin toxicity:

Grade 1 (numbness, dysesthesia, paresthesia, tingling, painless swelling, erythema or discomfort of the hands or feet which do not disrupt normal activities): Continue sorafenib and consider symptomatic treatment with topical therapy.

Grade 2 (painful erythema and swelling of the hands or feet and/or discomfort affecting normal activities):

1st occurrence: Continue sorafenib and consider symptomatic treatment with topical therapy. **Note:** If no improvement within 7 days, see dosing for 2nd or 3rd occurrence.

2nd or 3rd occurrence: Hold treatment until resolves to grade 0-1; resume treatment with dose reduced by one dose level (400 mg daily or 400 mg every other day)

4th occurrence: Discontinue treatment

Grade 3 (moist desquamation, ulceration, blistering, or severe pain of the hands or feet or severe discomfort that prevents working or performing daily activities):

1st or 2nd occurrence: Hold treatment until resolves to grade 0-1; resume treatment with dose reduced by one dose level (400 mg daily or 400 mg every other day)

3rd occurrence: Discontinue treatment

Administration: OralAdminister with water on an empty stomach (1 hour before or 2 hours after eating). Swallow tablet whole.
Dietary ConsiderationsTake without food (1 hour before or 2 hours after eating).

StorageStore at room temperature of 25°C (77°F); excursions permitted to 15°C and 30°C (59°F and 86°F). Protect from moisture.
ContraindicationsHypersensitivity to sorafenib or any component of the formulation
Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bleeding: Increased risk of bleeding may occur; consider discontinuing with serious bleeding events.
- Cardiac ischemia/infarction: May cause cardiac ischemia or infarction; discontinuation (temporary or permanent) in patients who develop these should be considered. Use in patients with unstable coronary artery disease or recent myocardial infarction has not been studied. Use with caution in patients with cardiovascular disease.
- Dermatologic reactions: Hand-foot skin reaction and rash are the most common adverse events; usually managed with topical treatment, treatment delays, and/or dose reductions.
- Gastrointestinal perforation: Gastrointestinal perforation has been reported (rare); monitor patients for signs/symptoms (abdominal pain, constipation, or vomiting); discontinue treatment if gastrointestinal perforation occurs.
- Hypertension: May cause hypertension, especially in the first 6 weeks of treatment; monitor. Use caution in patients with underlying or poorly-controlled hypertension.
- Wound healing complications: May complicate wound healing; temporarily withhold treatment for patients undergoing major surgical procedures.

Disease-related concerns:

- Hepatic impairment: Sorafenib levels may be lower in HCC patients with mild-to-moderate hepatic impairment (Child-Pugh classes A and B). Use with extreme caution in patients with HCC with elevated bilirubin levels. Not studied in patients with severe hepatic impairment (Child-Pugh class C). The optimal dose in non-HCC patients with hepatic impairment has not been established.
- Renal impairment: Not studied in dialysis patients.

Concurrent drug therapy issues:

- CYP3A4 inducers: Avoid concurrent use (if possible) with strong CYP3A4 inducers (eg, carbamazepine, dexamethasone, phenobarbital, phenytoin, rifampin, St. John's wort); may decrease sorafenib levels/effects.
- UGT1A1 substrates: Use caution when administering sorafenib with compounds that are metabolized predominantly via UGT1A1 (eg, irinotecan).
- Warfarin: Monitor PT/INR in patients on warfarin therapy; due to potential for bleeding events to occur.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo difference in efficacy or safety was observed between older and younger patients, but only 4% of patients studied were >75 years of age.
Pregnancy Risk FactorD
Pregnancy ConsiderationsAnimal studies have demonstrated teratogenicity and fetal loss. There are no adequate and well-controlled studies in pregnant women. Because sorafenib inhibits angiogenesis, a critical component of fetal development, adverse effects on pregnancy would be expected. Women of childbearing potential should be advised to avoid pregnancy. Men and women should use effective birth control during treatment and for at least 2 weeks after treatment is discontinued.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsDue to the potential for serious adverse effects in the nursing infant, breast-feeding is not recommended.
Adverse Reactions

>10%:

Cardiovascular: Hypertension (9% to 17%; grade 3: 3% to 4%; grade 4: <1%; onset: ~3 weeks)

Central nervous system: Fatigue (37% to 46%), sensory neuropathy (≤13%), pain (11%)

Dermatologic: Rash/desquamation (19% to 40%; grade 3: ≤1%), hand-foot syndrome (21% to 30%; grade 3: 6% to 8%), alopecia (14% to 27%), pruritus (14% to 19%), dry skin (10% to 11%), erythema

Endocrine & metabolic: Hypoalbuminemia (≤59%), hypophosphatemia (35% to 45%; grade 3: 11% to 13%; grade 4: <1%)

Gastrointestinal: Diarrhea (43% to 55%; grade 3: 2% to 10%; grade 4: <1%), lipase increased (40% to 41% [usually transient]), amylase increased (30% to 34% [usually transient]), abdominal pain (11% to 31%), weight loss (10% to 30%), anorexia (16% to 29%), nausea (23% to 24%), vomiting (15% to 16%), constipation (14% to 15%)

Hematologic: Lymphopenia (23% to 47%; grades 3/4: ≤13%), thrombocytopenia (12% to 46%; grades 3/4: 1% to 4%), INR increased (≤42%), neutropenia (≤18%; grades 3/4: ≤5%), hemorrhage (15% to 18%; grade 3: 2% to 3%; grade 4: ≤2%), leukopenia

Hepatic: Liver dysfunction (≤11%; grade 3: 2%; grade 4: 1%)

Neuromuscular & skeletal: Muscle pain, weakness

Respiratory: Dyspnea (≤14%), cough (≤13%)

1% to 10%:

Cardiovascular: Cardiac ischemia/infarction (≤3%), flushing

Central nervous system: Headache (≤10%), depression, fever

Dermatologic: Acne, exfoliative dermatitis

Gastrointestinal: Appetite decreased, dyspepsia, dysphagia, esophageal varices bleeding (2%), glossodynia, mucositis, stomatitis, xerostomia

Genitourinary: Erectile dysfunction

Hematologic: Anemia

Hepatic: Transaminases increased (transient)

Neuromuscular & skeletal: Joint pain (≤10%), arthralgia, myalgia

Respiratory: Hoarseness

Miscellaneous: Influenza-like symptoms

<1%, postmarketing, and/or case reports: Acute renal failure, alkaline phosphatase increased, arrhythmia, bilirubin increased, bone pain, cardiac failure, cerebral hemorrhage, CHF, dehydration, eczema, epistaxis, erythema multiforme, folliculitis, gastritis, gastrointestinal hemorrhage, gastrointestinal perforation, gastrointestinal reflux, gynecomastia, hypersensitivity (skin reaction, urticaria), hypertensive crisis, hyponatremia, hypothyroidism, infection, jaundice, MI, mouth pain, myocardial ischemia, pancreatitis, pleural effusion, preeclampsia-like syndrome (reversible hypertension and proteinuria), renal failure, respiratory hemorrhage, reversible posterior leukoencephalopathy syndrome (RPLS), rhinorrhea, skin cancer (squamous cell/keratoacanthomas), thromboembolism, tinnitus, transient ischemic attack, tumor pain, voice alteration

Oncology: Emetic PotentialLow (10% to 30%)

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor); **Inhibits** CYP2B6 (moderate), 2C8 (strong), 2C9 (moderate)

Drug Interactions

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

CYP2B6 Substrates: CYP2B6 Inhibitors (Moderate) may decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Strong) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Strong): May increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Dacarbazine: Sorafenib may decrease the serum concentration of Dacarbazine. Sorafenib may also increase the concentration of dacarbazine's active metabolite. *Risk C: Monitor therapy*

DOXOrubicin: Sorafenib may increase the serum concentration of DOXOrubicin. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Fluorouracil: Sorafenib may decrease the serum concentration of Fluorouracil. Sorafenib may increase the serum concentration of Fluorouracil. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Irinotecan: Sorafenib may increase the serum concentration of Irinotecan. Sorafenib may also increase the concentration of the active metabolite of irinotecan, SN-38. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Warfarin: Sorafenib may enhance the anticoagulant effect of Warfarin. Sorafenib may increase the serum concentration of Warfarin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Bioavailability is decreased 29% with a high-fat meal (bioavailability is similar to fasting state when administered with a moderate-fat meal).

Herb/Nutraceutical: Avoid St John's wort (may decrease the levels/effects of sorafenib).

Monitoring ParametersCBC with differential, electrolytes, phosphorus, lipase and amylase levels; blood pressure (baseline, weekly for the first 6 weeks, then periodic)

Nursing: Physical Assessment/MonitoringUse caution in presence of hypertension, cardiac artery disease or recent MI. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg. warfarin, digoxin). Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions or toxicity on a regular basis (gastrointestinal perforation [abdominal pain, constipation, vomiting], diarrhea, fatigue, rash, or hand-foot syndrome); dosing adjustments may be necessary. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, electrolytes, phosphorus, lipase and amylase levels

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take exactly as directed 1 hour before or 2 hours after eating. You may need periodic laboratory tests while taking this medication. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience loss of appetite; nausea and vomiting (small, frequent meals and frequent mouth care may help); diarrhea (buttermilk, boiled milk, or yogurt may help); or hair loss (may grow back when treatment is discontinued). Report immediately persistent or acute headache, dizziness, or vision changes (monitor blood pressure if recommended by prescriber); chest pain or palpitations; or unusual bleeding. Report unusual skin rash; hand and foot syndrome (redness, tenderness, dryness, peeling, numbness, or tingling of the palms and soles); persistent gastrointestinal upset (diarrhea, constipation, abdominal pain); unusual or persistent cough; bone, joint, or muscle weakness or pain or loss of sensation; flu-like symptoms; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber is you are pregnant. Do not get pregnant while taking this drug or for two weeks after discontinuing. May cause fetal defects or fetal loss. Males and females should consult prescriber for appropriate contraceptive measures while on this medication. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as tosylate:

Nexavar®: 200 mg

Generic AvailableNo

ManufacturerBayer HealthCare

Mechanism of ActionMultikinase inhibitor; inhibits tumor growth and angiogenesis by inhibiting intracellular Raf kinases (CRAF, BRAF, and mutant BRAF), and cell surface kinase receptors (VEGFR-2, VEGFR-3, PDGFR-beta, cKIT, and FLT-3)

Pharmacodynamics/Kinetics

Protein binding: 99.5%

Metabolism: Hepatic, via CYP3A4 (primarily oxidated to the pyridine N-oxide; active, minor) and UGT1A9 (glucuronidation)

Bioavailability: 38% to 49%; reduced when administered with a high-fat meal

Half-life elimination: 25-48 hours

Time to peak, plasma: ~3 hours

Excretion: Feces (77%, 51% as unchanged drug); urine (19%, as metabolites)

Related Information

- Management of Nausea and Vomiting
- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mouth pain, mucositis, stomatitis, xerostomia (normal salivary flow resumes upon discontinuation), and dysphagia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsSorafenib may cause hypertension; monitor blood pressure prior to vasoconstrictor use

Mental Health: Effects on Mental StatusSedation is common; may cause depression

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concomitant use with SSRIs, lithium, valproic acid may produce additive effects. Sedative effects may be additive if used in combination with psychotropics. May cause neutropenia, thrombocytopenia, or leukopenia; use caution with clozapine, carbamazepine, and valproic acid. Avoid concurrent use with St John's wort.

English ▾ English ▾

Jump To Field (Select Field Name) ▾

Pronunciation(SOR bi tole)

Pharmacologic CategoryGenitourinary Irrigant; Laxative, Osmotic

Use: Labeled IndicationsGenitourinary irrigant in transurethral prostatic resection or other transurethral resection or other transurethral surgical procedures; diuretic; humectant; sweetening agent; hyperosmotic laxative; facilitate the passage of sodium polystyrene sulfonate through the intestinal tract

Dosing: Adults

Hyperosmotic laxative (as single dose, at infrequent intervals):

Oral: 30-150 mL (as 70% solution)

Rectal enema: 120 mL as 25% to 30% solution

Adjunct to sodium polystyrene sulfonate: 15 mL as 70% solution orally until diarrhea occurs (10-20 mL/2 hours) or 20-100 mL as an oral vehicle for the sodium polystyrene sulfonate resin

When administered with charcoal:

Oral: 4.3 mL/kg of 70% sorbitol with 1 g/kg of activated charcoal every 4 hours until first stool containing charcoal is passed

Transurethral surgical procedures: Irrigation: Topical: 3% to 3.3% as transurethral surgical procedure irrigation

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Hyperosmotic laxative (as single dose, at infrequent intervals):

Children 2-11 years:

Oral: 2 mL/kg (as 70% solution)

Rectal enema: 30-60 mL as 25% to 30% solution

Children >12 years: Oral, Rectal enema: Refer to adult dosing.

When administered with charcoal: Oral: Children: 4.3 mL/kg of 35% sorbitol with 1 g/kg of activated charcoal

StorageAvoid storage in temperatures >150°F; do not freeze.

ContraindicationsAnuria

Warnings/Precautions

Concerns related to adverse effects:

- Fluid/electrolyte imbalance: Large volumes may result in fluid overload and/or electrolyte changes.

Disease-related concerns:

- Cardiopulmonary disease: Use with caution in patients with severe cardiopulmonary disease.
- Renal impairment: Use with caution in patients with renal impairment.
- Unable to metabolize sorbitol: Use with caution in patients unable to metabolize sorbitol.

Geriatric ConsiderationsCauses for constipation must be evaluated prior to initiating treatment. Nonpharmacological dietary treatment should be initiated before laxative use. Sorbitol is as effective as lactulose but is much less expensive.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown

Adverse ReactionsFrequency not defined.

Cardiovascular: Edema

Endocrine & metabolic: Fluid and electrolyte losses, hyperglycemia, lactic acidosis

Gastrointestinal: Diarrhea, nausea, vomiting, abdominal discomfort, xerostomia

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersMonitor for fluid overload and/or electrolyte disturbances following large volumes; changes may be delayed due to slow absorption

Nursing: Physical Assessment/MonitoringWhen used as cathartic, determine cause of constipation before use. Assess knowledge/teach patient about use of nonpharmacological interventions to prevent constipation.

Monitoring: Lab TestsElectrolytes

Patient EducationCathartic: Use of cathartics on a regular basis will have adverse effects. Increased exercise, increased fluid intake, or increased dietary fruit and fiber may be effective in preventing and resolving constipation. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, genitourinary irrigation: 3% (3000 mL, 5000 mL); 3.3% (2000 mL, 4000 mL)

Solution, oral: 70% (30 mL, 480 mL, 3840 mL)

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Sorbitol)

70% (473): $17.99

Mechanism of ActionA polyalcoholic sugar with osmotic cathartic actions

Pharmacodynamics/Kinetics

Onset of action: 0.25-1 hour

Absorption: Oral, rectal: Poor

Metabolism: Primarily hepatic to fructose

Related Information

- Laxatives, Classification and Properties

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Sotalol may be confused with Stadol®

Betapace® may be confused with Betapace AF®

Betapace AF® may be confused with Betapace®

Pronunciation(SOE ta lole)

U.S. Brand NamesBetapace AF®; Betapace®; Sorine®

Canadian Brand NamesApo-Sotalol®; Betapace AF®; CO Sotalol; DOM-Sotalol; Gen-Sotalol; Lin-Sotalol; MED-Sotalol; Novo-Sotalol; Nu-Sotalol; PHL-Sotalol; PMS-Sotalol; PRO-Sotalol; RATIO-Sotalol; RHOXAL-Sotalol; Riva-Sotalol; Rylosol; SANDOZ-Sotalol

Pharmacologic CategoryAntiarrhythmic Agent, Class II; Antiarrhythmic Agent, Class III; Beta Blocker, Nonselective

Use: Labeled IndicationsTreatment of documented ventricular arrhythmias (ie, sustained ventricular tachycardia), that in the judgment of the physician are life-threatening; maintenance of normal sinus rhythm in patients with symptomatic atrial fibrillation and atrial flutter who are currently in sinus rhythm. Manufacturer states substitutions should not be made for Betapace AF® since Betapace AF® is distributed with a patient package insert specific for atrial fibrillation/flutter.

Dosing: AdultsSotalol should be initiated and doses increased in a hospital with facilities for cardiac rhythm monitoring and assessment. Proarrhythmic events can occur after initiation of therapy and with each upward dosage adjustment.

Ventricular arrhythmias (Betapace®, Sorine®): Oral:

Initial: 80 mg twice daily; dose may be increased gradually to 240-320 mg/day; allow 3 days between dosing increments (to attain steady-state plasma concentrations and to allow monitoring of QT intervals).

Usual range: Most patients respond to 160-320 mg/day in 2-3 divided doses.

Maximum: Some patients, with life-threatening refractory ventricular arrhythmias, may require doses as high as 480-640 mg/day; prescribed ONLY when the potential benefit outweighs the increased of adverse events.

Atrial fibrillation or atrial flutter (Betapace AF®): Oral: Initial: 80 mg twice daily

Note: If the initial dose does not reduce the frequency of relapses of atrial fibrillation/flutter and is tolerated without excessive QT prolongation (not >520 msec) after 3 days, the dose may be increased to 120 mg twice daily. This may be further increased to 160 mg twice daily if response is inadequate and QT prolongation is not excessive.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricSotalol should be initiated and doses increased in a hospital with facilities for cardiac rhythm monitoring and assessment. Proarrhythmic events can occur after initiation of therapy and with each upward dosage adjustment.

Note: The safety and efficacy of sotalol in children have not been established

Supraventricular arrhythmias: Oral: **Note:** Dosing per manufacturer, based on pediatric pharmacokinetic data; wait at least 36 hours between dosage adjustments to allow monitoring of QT intervals

Children ≤2 years: Dosage should be adjusted (decreased) by plotting of the child's age on a logarithmic scale; see graph or refer to manufacturer's package labeling.

Children >2 years: Initial: 90 mg/m^2/day in 3 divided doses; may be incrementally increased to a maximum of 180 mg/m^2/day

Dosing: Renal ImpairmentAdults: Impaired renal function can increase the terminal half-life, resulting in increased drug accumulation. Sotalol (Betapace AF®) is contraindicated per the manufacturer for treatment of atrial fibrillation/flutter in patients with a Cl_{cr} <40 mL/minute.

Ventricular arrhythmias (Betapace®, Sorine®):

Cl_{cr} >60 mL/minute: Administer every 12 hours.

Cl_{cr} 30-60 mL/minute: Administer every 24 hours.

Cl_{cr} 10-30 mL/minute: Administer every 36-48 hours.

Cl_{cr} <10 mL/minute: Individualize dose.

Atrial fibrillation/flutter (Betapace AF®):

Cl_{cr} >60 mL/minute: Administer every 12 hours.

Cl_{cr} 40-60 mL/minute: Administer every 24 hours.

Cl_{cr} <40 mL/minute: Use is contraindicated.

Dialysis: Hemodialysis would be expected to reduce sotalol plasma concentrations because sotalol is not bound to plasma proteins and does not undergo extensive metabolism. Administer dose postdialysis or administer supplemental 80 mg dose. Peritoneal dialysis does not remove sotalol; supplemental dose is not necessary.

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsAdminister on an empty stomach.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

Extemporaneously PreparedTo make a 5 mg/mL oral solution, using a 6-ounce amber plastic prescription bottle, add five sotalol 120 mg tablets to 120 mL of simple syrup containing 0.1% sodium benzoate (tablets do not need to be crushed). Shake well. Allow tablets to hydrate for ~2 hours; shake intermittently until tablets completely disintegrate. Store at room temperature; shake well before use. Stable for 3 months. (Refer to manufacturer's current labeling.)

ContraindicationsHypersensitivity to sotalol or any component of the formulation; bronchial asthma; sinus bradycardia; second- and third-degree AV block (unless a functioning pacemaker is present); congenital or acquired long QT syndromes; cardiogenic shock; uncontrolled congestive heart failure. Betapace AF® is contraindicated in patients with significantly reduced renal filtration (Cl_{cr} <40 mL/minute).

Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Boxed warnings:

- Dose initiation/increases: See “Other warnings/precautions” below.
- Product substitution: See “Dosage form specific issues” below.

Concerns related to adverse effects:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.
- Proarrhythmic effects: Watch for proarrhythmic effects; monitor and adjust dose to prevent QT_c prolongation.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; if used at all, should be used cautiously with close monitoring.
- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.
- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.
- Electrolyte imbalances: Correct electrolyte imbalances before initiating (especially hypokalemia and hypomagnesemia).
- Heart failure (HF): Use with caution in patients with compensated heart failure and monitor for a worsening of the condition.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis; may worsen disease.
- Myocardial infarction: Use with caution within the first 2 weeks post-MI (experience limited).
- Peripheral vascular disease (PVD): Use with caution in patients with PVD (including Raynaud's).
- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.
- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required. Creatinine clearance must be calculated with dose initiation and dose increases.

Concurrent drug therapy issues:

- Anesthetic agents: Use with caution in patients receiving anesthetic agents which decrease myocardial function.
- Calcium channel blockers: Use with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block can occur.
- QT_c-prolonging drugs: Concurrent use with other QT_c-prolonging drugs (including Class I and Class III antiarrhythmics) is generally not recommended; withhold for 3 half-lives.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Product substitution: **[U.S. Boxed Warning]: Betapace® should not be substituted for Betapace® AF; Betapace® AF is distributed with an educational insert specifically for patients with atrial fibrillation/flutter.**

Other warnings/precautions:

- Abrupt withdrawal: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered to avoid acute tachycardia, hypertension, and/or ischemia.

- Dose initiation/increases: **[U.S. Boxed Warning]: Manufacturer recommends initiation (or reinitiation) and dose increases be done in a hospital setting with continuous monitoring and staff familiar with the recognition and treatment of life-threatening arrhythmias.** Some experts will initiate therapy on an outpatient basis in a patient without heart disease or bradycardia, who has a baseline uncorrected QT interval <450 msec, and normal serum potassium and magnesium levels; close EKG monitoring during this time is necessary. ACC/AHA guidelines for management of atrial fibrillation also recommend that for outpatient initiation the patient not have risk factors predisposing to drug-induced ventricular proarrhythmia (Fuster, 2001). Dosage should be adjusted gradually with 3 days between dosing increments to achieve steady-state concentrations, and to allow time to monitor QT intervals.

Geriatric ConsiderationsSince elderly frequently have Cl_{cr} <60 mL/minute, attention to dose, creatinine clearance, and monitoring is important. Make dosage adjustments at 3-day intervals or after 5-6 doses at any dosage.

Pregnancy Risk FactorB

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Beta-blockers have been associated with bradycardia, hypotension, and IUGR; IUGR is probably related to maternal hypertension. Sotalol has been shown to cross the placenta, and is found in amniotic fluid; therefore, sotalol should be used during pregnancy only if the potential benefit outweighs the potential risk. Cases of neonatal hypoglycemia have been reported following maternal use of beta-blockers at parturition or during breast-feeding. Monitor breast-fed infant for symptoms of beta-blockade.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsSotalol is considered compatible by the AAP. It is recommended that the infant be monitored for signs or symptoms of beta-blockade (hypotension, bradycardia, etc) with long-term use.

Adverse Reactions

>10%:

Cardiovascular: Bradycardia (16%), chest pain (16%), palpitation (14%)

Central nervous system: Fatigue (20%), dizziness (20%), lightheadedness (12%)

Neuromuscular & skeletal: Weakness (13%)

Respiratory: Dyspnea (21%)

1% to 10%:

Cardiovascular: Edema (8%), abnormal ECG (7%), hypotension (6%), proarrhythmia (5%), syncope (5%), CHF (5%), peripheral vascular disorders (3%)

Central nervous system: Headache (8%), sleep problems (8%), mental confusion (6%), anxiety (4%), depression (4%)

Dermatologic: Itching/rash (5%)

Endocrine & metabolic: Sexual ability decreased (3%)

Gastrointestinal: Nausea/vomiting (10%), diarrhea (7%),stomach discomfort (3% to 6%), flatulence (2%)

Genitourinary: Impotence (2%)

Hematologic: Bleeding (2%)

Neuromuscular & skeletal: Extremity pain (7%), paresthesia (4%), back pain (3%)

Ocular: Visual problems (5%)

Respiratory: Upper respiratory problems (5% to 8%), asthma (2%)

<1% (Limited to important or life-threatening): Alopecia, clouded sensorium, cold extremities, diaphoresis, emotional lability, eosinophilia, fever, hyperlipidemia, incoordination, leukopenia, myalgia, paralysis, phlebitis, photosensitivity reaction, pruritus, pulmonary edema, Raynaud's phenomenon, red crusted skin, serum transaminases increased, skin necrosis after extravasation, thrombocytopenia, vertigo, xerostomia

Postmarketing and/or case reports: Bronchiolitis obliterans with organized pneumonia, leukocytoclastic vasculitis, retroperitoneal fibrosis

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Sotalol peak serum concentrations may be decreased if taken with food.

Herb/Nutraceutical: Avoid ephedra (may worsen arrhythmia).

Monitoring ParametersSerum magnesium, potassium, ECG

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess blood pressure and heart rate prior to and following first dose and with any change in dosage. Assess results of laboratory tests, therapeutic effectiveness, and adverse effects (eg, cardiac and pulmonary status). Advise patients with diabetes to monitor glucose levels closely (beta-blockers may alter glucose tolerance). Do not discontinue abruptly; dose should be tapered gradually. Teach patient appropriate use, possible side effects/interventions (hypotension precautions), and adverse symptoms to report.

Monitoring: Lab TestsSerum magnesium, potassium

Patient EducationDo not take any new medications without consulting prescriber. Take exactly as directed; do not adjust dosage or discontinue without consulting prescriber. Take pulse daily (prior to medication) and follow prescriber's instruction about holding of medication. If you have diabetes, monitor serum sugar closely (drug may alter glucose tolerance or mask signs of hypoglycemia). May cause fatigue, dizziness, lightheadedness (use caution when driving or engaging in activities requiring alertness until response to drug is known), or postural hypotension (use caution when changing position from lying or sitting to standing, when driving, or climbing stairs until response to medication is known); alteration in sexual performance (reversible); nausea or vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or diarrhea (boiled milk, buttermilk, or yogurt may help). Report immediately any chest pain, palpitations, irregular heartbeat; swelling of extremities, respiratory difficulty, new cough, or unusual fatigue; persistent nausea, vomiting, or diarrhea; or unusual muscle weakness. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 80 mg, 80 mg [artrial fibrillation], 120 mg, 120 mg [artrial fibrillation], 160 mg, 160 mg [artrial fibrillation], 240 mg

Betapace®: 80 mg, 120 mg, 160 mg, 240 mg

Betapace AF®: 80 mg, 120 mg, 160 mg [artrial fibrillation]

Sorine®: 80 mg, 120 mg, 160 mg, 240 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Betapace)

80 mg (60): $216.46

120 mg (60): $289.44

120 mg (30): $96.99

160 mg (30): $123.99

Mechanism of Action

Beta-blocker which contains both beta-adrenoreceptor-blocking (Vaughan Williams Class II) and cardiac action potential duration prolongation (Vaughan Williams Class III) properties

Class II effects: Increased sinus cycle length, slowed heart rate, decreased AV nodal conduction, and increased AV nodal refractoriness

Class III effects: Prolongation of the atrial and ventricular monophasic action potentials, and effective refractory prolongation of atrial muscle, ventricular muscle, and atrioventricular accessory pathways in both the antegrade and retrograde directions

Sotalol is a racemic mixture of *d*- and *l*-sotalol; both isomers have similar Class III antiarrhythmic effects while the *l*-isomer is responsible for virtually all of the beta-blocking activity

Sotalol has both beta$_1$- and beta$_2$-receptor blocking activity

The beta-blocking effect of sotalol is a noncardioselective [half maximal at about 80 mg/day and maximal at doses of 320-640 mg/day]. Significant beta-blockade occurs at oral doses as low as 25 mg/day.

The Class III effects are seen only at oral doses ≥160 mg/day

Pharmacodynamics/Kinetics

Onset of action: Rapid, 1-2 hours

Peak effect: 2.5-4 hours

Duration: 8-16 hours

Absorption: Decreased 20% to 30% by meals compared to fasting

Distribution: Low lipid solubility; enters milk of laboratory animals and is reported to be present in human milk

Protein binding: None

Metabolism: None

Bioavailability: 90% to 100%

Half-life elimination: 12 hours; Children: 9.5 hours; terminal half-life decreases with age <2 years (may by ≥1 week in neonates)

Excretion: Urine (as unchanged drug)

Pharmacotherapy PearlsPharmacokinetics in children are more relevant for BSA than age.

Dental Health: Effects on Dental TreatmentSotalol is a nonselective beta-blocker and may enhance the pressor response to epinephrine, resulting in hypertension and bradycardia. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution; epinephrine has interacted with nonselective beta-blockers to result in initial hypertensive episode followed by bradycardia. Sotalol is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusDizziness and drowsiness are common; may cause confusion, anxiety, or depression

Mental Health: Effects on Psychiatric TreatmentContraindicated with ziprasidone. May rarely cause leukopenia; use caution with clozapine and carbamazepine. Barbiturates may decrease the effects of beta-blockers; beta-blockers may alter the effects antipsychotics; monitor for altered response.

Cardiovascular ConsiderationsAs with other antiarrhythmics, sotalol is proarrhythmic (eg, torsade de pointes) and therapy with the d-isomer (d-sotalol) increased mortality, presumably due to arrhythmias, in patients with heart failure and myocardial infarction. It is therefore prudent to carefully select and monitor patients on sotalol and avoid its use in patients with a history of heart failure or myocardial infarction.

Anesthesia and Critical Care Concerns/Other Considerations**Withdrawal:** Beta-blocker therapy should not be withdrawn abruptly, but gradually tapered to avoid acute tachycardia and hypertension.

Index TermsSotalol Hydrochloride

Medication Safety Issues

Sound-alike/look-alike issues:

Trobicin® may be confused with tobramycin

Pronunciation(spek ti noe MYE sin)
U.S. Brand NamesTrobicin® [DSC]
Pharmacologic CategoryAntibiotic, Miscellaneous
Use: Labeled IndicationsTreatment of uncomplicated gonorrhea
Dosing: Adults

Uncomplicated gonorrhea (urethral, cervical, pharyngeal, or rectal): I.M.: 2 g deep I.M. or 4 g where antibiotic resistance is prevalent 1 time; 4 g (10 mL) dose should be given as two 5 mL injections, followed by adequate chlamydial treatment (doxycycline 100 mg twice daily for 7 days)

Disseminated gonococcal infection: I.M.: 2 g every 12 hours

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Gonorrhea:** I.M.: Children:

<45 kg: 40 mg/kg/dose 1 time (ceftriaxone preferred)

≥45 kg: Refer to adult dosing.

Children >8 years who are allergic to PCNS/cephalosporins may be treated with oral tetracycline.

Dosing: Renal ImpairmentHemodialysis effects: 50% removed by hemodialysis
Administration: I.M.For I.M. use only.
StorageUse reconstituted solutions within 24 hours.
ReconstitutionReconstitute with supplied diluent only.
ContraindicationsHypersensitivity to spectinomycin or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Syphilis: Since spectinomycin is ineffective in the treatment of syphilis and may mask symptoms, all patients should be tested for syphilis at the time of gonorrheal diagnosis and 3 months later.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorB
LactationEnters breast milk/effect on infant unknown
Adverse Reactions<1%: Chills, dizziness, headache, nausea, pain at injection site, pruritus, rash, urticaria, vomiting
Drug Interactions

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringAssess knowledge/teach patient sexually transmitted diseases precautions. Monitor effectiveness and evaluate laboratory results.
Monitoring: Lab TestsTest for syphilis before treatment and 3 months later (see Warnings/Precautions).
Patient EducationThis medication can only be administered I.M. You will need to return for follow-up blood tests. **Breast-feeding precaution:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as hydrochloride:

Trobicin®: 2 g [diluent contains benzyl alcohol] [DSC]

Generic AvailableNo

Mechanism of ActionA bacteriostatic antibiotic that selectively binds to the 30s subunits of ribosomes, and thereby inhibiting bacterial protein synthesis

Pharmacodynamics/Kinetics

Duration: Up to 8 hours

Absorption: I.M.: Rapid and almost complete

Distribution: Concentrates in urine; does not distribute well into the saliva

Half-life elimination: 1.7 hours

Time to peak: ~1 hour

Excretion: Urine (70% to 100% as unchanged drug)

Related Information

Pronunciation(speer a MYE sin)
Canadian Brand NamesRovamycine®
Pharmacologic CategoryAntibiotic, Macrolide
Use: Labeled IndicationsTreatment of infections of the respiratory tract, buccal cavity, skin and soft tissues due to susceptible organisms. *N. gonorrhoeae*: as an alternate choice of treatment for gonorrhea in patients allergic to the penicillins. Before treatment of gonorrhea, the possibility of concomitant infection due to *T. pallidum* should be excluded.
Use: Unlabeled/InvestigationalTreatment of *Toxoplasma gondii* to prevent transmission from mother to fetus
Dosing: Adults

Mild-moderate infections: Oral: 6,000,000 to 9,000,000 int. units (4-6 capsules of Rovamycine® "500" per day) in 2 divided doses

Severe infections: Oral: 12,000,000 to 15,000,000 int. units (8-10 capsules of Rovamycine® "500" per day) in 2 divided doses

Gonorrhea: Oral: 12,000,000 to 13,500,000 int. units (8-9 capsules of Rovamycine® "500") as a single dose

Dosing: ElderlyRefer to adult dosage.
Dosing: PediatricSusceptible infections: Oral: Dosage by body weight; usual dosage 150,000 int units/kg; expressed as the number of 750,000 int. unit (Rovamycine "250") capsules per day. Daily dose should be administered in 2-3 divided doses.

15 kg = 3 capsules per day

20 kg = 4 capsules per day

30 kg = 6 capsules per day

Note: In severe infections, dosage may be increased by 50%.

Dosing: Renal ImpairmentNo dosage adjustment required.
Dietary ConsiderationsMay be taken with or without food. Food may improve gastrointestinal tolerance.
StorageStore at 20°C to 25°C (68°F to 77°F).
RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to spiramycin, other macrolides (eg, erythromycin) or any component of the formulation
Allergy Considerations

- Macrolide Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: Macrolides have been associated with rare QT_c prolongation and ventricular arrhythmias, including torsade de pointes; use with caution in patients at risk of prolonged cardiac repolarization.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with pre-existing liver disease; hepatic impairment, including hepatocellular and/or cholestatic hepatitis, with or without jaundice, has been observed. Discontinue if symptoms of malaise, nausea, vomiting, abdominal colic, and fever.

Pregnancy Risk FactorNot assigned (other macrolides rated B); C per expert analysis
Pregnancy ConsiderationsCrosses placenta. Specific safety information is not available. However, spiramycin has been used to treat *Toxoplasma gondii* to prevent transmission from mother to fetus.
LactationEnters breast milk/compatible (based on other macrolides)
Breast-Feeding ConsiderationsExcreted in breast milk in bacteriostatic concentrations.
Adverse ReactionsFrequency not defined.

Dermatologic: Rash, urticaria, pruritus, angioedema (rare)

Gastrointestinal: Nausea, vomiting, diarrhea, pseudomembranous colitis (rare)

Hepatic: Transaminases increased

Neuromuscular & skeletal: Paresthesia (rare)

Miscellaneous: Anaphylactic shock (rare)

Note: Rare adverse reactions associated with other macrolide antibiotics include life-threatening ventricular arrhythmia, prolongation of QT_c, and neuromuscular blockade.

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)
Drug Interactions

Cardiac Glycosides: Macrolide Antibiotics may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Etravirine: May decrease the serum concentration of Macrolide Antibiotics. Clarithromycin AUC is reduced and levels of the active metabolite (14-hydroxy-clarithromycin) are modestly increased. Management: For the treatment of *Mycobacterium avium* complex, consider changing to alternative agent, such as azithromycin. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Patient Education

Report persistent diarrhea.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Rovamycine® “250”: 750,000 int. units

Rovamycine® “500”: 1,500,000 int. units

Generic AvailableNo
ManufacturerAventis Pharma (Canada)
Mechanism of ActionInhibits growth of susceptible organisms; mechanism not established.
Pharmacotherapy PearlsNot available in U.S.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentCarbamazepine, phenobarbital, and phenytoin may decrease the effects of spiramycin, while nefazodone may increase its effects. Effects of levodopa/carbidopa may be decreased.
Mental Health CommentMacrolides have been associated with QT_c prolongation; avoid ziprasidone.

Medication Safety Issues

Sound-alike/look-alike issues:

Aldactone® may be confused with Aldactazide®

International issues:

Aldactone®: Brand name for potassium canrenoate in Austria, Czech Republic, Germany, and Hungary

Pronunciation(speer on oh LAK tone)

U.S. Brand NamesAldactone®

Canadian Brand NamesAldactone®; Novo-Spiroton

Pharmacologic CategoryDiuretic, Potassium Sparing; Selective Aldosterone Blocker

Use: Labeled IndicationsManagement of edema associated with excessive aldosterone excretion; hypertension; congestive heart failure; primary hyperaldosteronism; hypokalemia; cirrhosis of liver accompanied by edema or ascites

Use: Unlabeled/InvestigationalFemale acne (adjunctive therapy); hirsutism; hypertension (pediatric); diuretic (pediatric)

Dosing: AdultsTo reduce delay in onset of effect, a loading dose of 2 or 3 times the daily dose may be administered on the first day of therapy. Oral:

Edema, hypokalemia: 25-200 mg/day in 1-2 divided doses

Hypertension (JNC 7): 25-50 mg/day in 1-2 divided doses

Diagnosis of primary aldosteronism: 100-400 mg/day in 1-2 divided doses

Acne in women (unlabeled use): 25-200 mg once daily

Hirsutism in women (unlabeled use): 50-200 mg/day in 1-2 divided doses

CHF, severe (with ACE inhibitor and a loop diuretic ± digoxin): 12.5-25 mg/day; maximum daily dose: 50 mg (higher doses may occasionallly be used). In the RALES trial, 25 mg every other day was the lowest maintenance dose possible.

Note: If potassium >5.4 mEq/L, consider dosage reduction.

Dosing: ElderlyOral: Initial: 25-50 mg/day in 1-2 divided doses; increase by 25-50 mg every 5 days as needed. Adjust for renal impairment.

Dosing: PediatricAdministration with food increases absorption. To reduce delay in onset of effect, a loading dose of 2 or 3 times the daily dose may be administered on the first day of therapy.

Edema, hypertension (unlabeled use): Oral: Children 1-17 years: Initial: 1 mg/kg/day divided every 12-24 hours (maximum dose: 3.3 mg/kg/day, up to 100 mg/day)

Diagnosis of primary aldosteronism (unlabeled use): Oral: 125-375 mg/m^2/day in divided doses

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer every 12-24 hours.

Cl_{cr} <10 mL/minute: Avoid use.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Dietary ConsiderationsShould be taken with food to decrease gastrointestinal irritation and to increase absorption. Excessive potassium intake (eg, salt substitutes, low-salt foods, bananas, nuts) should be avoided.

StorageProtect from light.

Extemporaneously PreparedA 25 mg/mL oral suspension can be prepared by crushing one hundred twenty (120) 25 mg tablets in a mortar (reducing to a fine powder), and then mixing in 20 mL of vehicle (a 1:1 combination of Ora-Sweet® or Ora-Sweet® SF and Ora-Plus®) to create a uniform paste. Continue to add vehicle in geometric amounts (while mixing) until near-final volume is achieved. Transfer to a graduate and add sufficient quantity to make 120 mL. Label “shake well” and “refrigerate.” Refrigerated stability is 60 days.

Allen LV Jr and Erickson MA III, “Stability of Ketoconazole, Metolazone, Metronidazole, Procainamide Hydrochloride, and Spironolactone in Extemporaneously Compounded Oral Liquids,” *Am J Health Syst Pharm*, 1996, 53:2073-8.

Nahata MC, Morosco RS, and Hipple TF, 4th ed, *Pediatric Drug Formulations*, Cincinnati, OH: Harvey Whitney Books Co, 2000.

Contraindications Hypersensitivity to spironolactone or any component of the formulation; anuria; acute renal insufficiency; significant impairment of renal excretory function; hyperkalemia; pregnancy (pregnancy-induced hypertension - per expert analysis)

Warnings/Precautions

Boxed warnings:

- Tumorigenic: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Fluid/electrolyte loss: Excess amounts can lead to profound diuresis with fluid and electrolyte loss; close medical supervision and dose evaluation are required. Watch for and correct electrolyte disturbances; adjust dose to avoid dehydration.

- Gynecomastia: Related to dose and duration of therapy.

- Tumorigenic: **[U.S. Boxed Warning]: Shown to be a tumorigen in chronic toxicity animal studies. Avoid unnecessary use.**

Disease-related concerns:

- Adrenal vein catheterization: Discontinue use prior to adrenal vein catheterization.

- Cirrhosis: In cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Heart failure: When evaluating a heart failure patient for spironolactone treatment, creatinine should be ≤2.5 mg/dL in men or ≤2 mg/dL in women and potassium <5 mEq/L.

Concurrent drug therapy issues:

- Potassium supplements: Avoid potassium supplements, potassium-containing salt substitutes, a diet rich in potassium, or other drugs that can cause hyperkalemia.

Geriatric Considerations When used in combination with ACE inhibitors, monitor patient for hyperkalemia.

Pregnancy Risk Factor C/D in pregnancy-induced hypertension (per expert analysis)

Pregnancy Considerations Teratogenic effects were not observed in animal studies; however, doses used were less than or equal to equivalent doses in humans. The antiandrogen effects of spironolactone have been shown to cause feminization of the male fetus in animal studies. Two case reports did not demonstrate this effect in humans however, the authors caution that adequate data is lacking. Diuretics are generally avoided in pregnancy due to the theoretical risk that decreased plasma volume may cause placental insufficiency. Diuretics should not be used during pregnancy in the presence of reduced placental perfusion (eg, pre-eclampsia, intrauterine growth restriction).

Lactation Enters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding Considerations The active metabolite of spironolactone has been found in breast milk. Effects to humans are not known; however, this metabolite was found to be carcinogenic in rats. The manufacturer recommends discontinuing spironolactone or using an alternative method of feeding.

Adverse Reactions Incidence of adverse events is not always reported. (Mean daily dose: 26 mg)

Cardiovascular: Edema (2%, placebo 2%)

Central nervous system: Disorders (23%, placebo 21%) which may include drowsiness, lethargy, headache, mental confusion, drug fever, ataxia, fatigue

Dermatologic: Maculopapular, erythematous cutaneous eruptions, urticaria, hirsutism, eosinophilia

Endocrine & metabolic: Gynecomastia (men 9%; placebo 1%), breast pain (men 2%; placebo 0.1%), serious hyperkalemia (2%, placebo 1%), hyponatremia, dehydration, hyperchloremic metabolic acidosis in decompensated hepatic cirrhosis, inability to achieve or maintain an erection, irregular menses, amenorrhea, postmenopausal bleeding

Gastrointestinal: Disorders (29%, placebo 29%) which may include anorexia, nausea, cramping, diarrhea, gastric bleeding, ulceration, gastritis, vomiting

Genitourinary: Disorders (12%, placebo 11%)

Hematologic: Agranulocytosis

Hepatic: Cholestatic/hepatocellular toxicity

Renal: Increased BUN concentration

Respiratory: Disorders (32%, placebo 34%)

Miscellaneous: Deepening of the voice, anaphylactic reaction, breast cancer

Drug Interactions

ACE Inhibitors: Potassium-Sparing Diuretics may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can

not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Ammonium Chloride: Potassium-Sparing Diuretics may enhance the adverse/toxic effect of Ammonium Chloride. Specifically the risk of systemic acidosis. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Cardiac Glycosides: Potassium-Sparing Diuretics may diminish the therapeutic effect of Cardiac Glycosides. Specifically, the inotropic effects. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Drospirenone: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Mitotane: Potassium-Sparing Diuretics may diminish the therapeutic effect of Mitotane. High dose diuretics (eg, Cushings syndrome) may present significantly higher risk than low doses (eg, CHF). *Risk D: Consider therapy modification*

Potassium Salts: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: Potassium-Sparing Diuretics may diminish the therapeutic effect of QuiNIDine. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Food increases absorption.

Herb/Nutraceutical: Avoid natural licorice (due to mineralocorticoid activity)

Test InteractionsMay cause false elevation in serum digoxin concentrations measured by RIA

Monitoring ParametersBlood pressure, serum electrolytes (potassium, sodium), renal function, I & O ratios and daily weight throughout therapy

CHF: Potassium levels and renal function should be checked in 3 days and 1 week after initiation, then every 2-4 weeks for 3-12 months, then every 3-6 months.

Nursing: Physical Assessment/MonitoringDiuretic effect may be delayed 2-3 days and antihypertensive effect may be delayed 2-3 weeks (see Dosing for loading dose recommendations). Assess potential for interactions with other pharmacological agents patient may be taking (eg, anything that will increase risk of hyperkalemia). Assess serum electrolytes and hepatic function on a regular basis during therapy. Monitor effectiveness (fluid status) and adverse reactions periodically (eg, CNS changes [drowsiness, headache, confusion], rash, gynecomastia, dehydration, hyperkalemia, jaundice). Teach patient appropriate use, possible side effects/appropriate interventions and symptoms to report.

Monitoring: Lab TestsSerum electrolytes (potassium, sodium), renal function

Patient EducationTake as directed, with meals. Avoid any potassium supplements (vitamin/mineral products), potassium-containing salt substitutes, natural licorice, or extra dietary intake of potassium. Weigh yourself weekly at the same time, in the same clothes, and report weight loss >5 lb/week. May cause dizziness, drowsiness, confusion, or headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or dry mouth (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or decreased sexual ability, gynecomastia, impotence, menstrual irregularities (reversible with discontinuing of medication). Report mental confusion; clumsiness; persistent fatigue, chills, numbness, or muscle weakness in hands, feet, or face; acute persistent diarrhea; chest pain, rapid heartbeat, or palpitations; excessive thirst; or respiratory difficulty; breast tenderness or increased body hair in females; breast enlargement or inability to achieve erection in males. **Pregnancy precaution:** Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 25 mg, 50 mg, 100 mg

Aldactone®: 25 mg

Aldactone®: 50 mg, 100 mg [scored]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Aldactone)

25 mg (30): $33.99

50 mg (30): $51.99

100 mg (30): $79.99

Tablets (Spironolactone)

25 mg (30): $15.99

50 mg (30): $21.99

Mechanism of ActionCompetes with aldosterone for receptor sites in the distal renal tubules, increasing sodium chloride and water excretion while conserving potassium and hydrogen ions; may block the effect of aldosterone on arteriolar smooth muscle as well

Pharmacodynamics/Kinetics

Duration: 2-3 days

Protein binding: 91% to 98%

Metabolism: Hepatic to multiple metabolites, including canrenone (active)

Half-life elimination: 78-84 minutes

Time to peak, serum: 1-3 hours (primarily as the active metabolite)

Excretion: Urine and feces

Related Information

- Heart Failure (Systolic)

Pharmacotherapy PearlsMaximum diuretic effect may be delayed 2-3 days and maximum hypertensive effects may be delayed 2-3 weeks.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness, dizziness, nervousness, or confusion

Mental Health: Effects on Psychiatric TreatmentHas been used to treat lithium-related edema

Cardiovascular Considerations

Heart Failure: The ACC/AHA 2005 Heart Failure Guidelines suggest that the addition of an aldosterone antagonist is reasonable in selected patients with moderately severe to severe symptoms of heart failure (HF) and reduced LVEF who can be carefully monitored (renal function and serum potassium). When evaluating a heart failure patient for aldosterone antagonist treatment, creatinine should be ≤2.5 mg/dL in men or ≤2 mg/dL in women and potassium <5 mEq/L. Patients are not candidates for such therapy if they are unable to comply with the monitoring required. In addition, the routine combined use of an ACE inhibitor, ARB, and aldosterone antagonist is not recommended in patients with current or prior symptoms of HF and reduced LVEF. In severe heart failure, spironolactone (25 mg/day), when combined with maximal standard therapy, resulted in a striking improvement in cardiovascular outcome (Pitt B, 1999). In the RALES trial, potassium supplementation was stopped with the initiation of spironolactone unless the patient was hypokalemic.

Monitoring Issues: Recently, a group of investigators published an observational study evaluating the effect of the RALES study on hospitalization for hyperkalemia in an older (>66 years of age) heart failure population on ACE inhibitors. This study was a population-based, timed-series analysis of healthcare databases in Ontario, Canada from January 1994 through December 2001(Juurlink DN, 2004). Computerized prescription records were reviewed to identify prescriptions for spironolactone, ACE inhibitors, angiotensin receptor antagonists, beta-blockers, loop diuretics, nonsteroidal anti-inflammatory agents, potassium supplements, thiazide diuretics, or other potassium-sparing diuretics. Hospitalization records were reviewed to identify hospitalizations for hyperkalemia or heart failure. Among patients treated with ACE inhibitors who had recently been hospitalized for heart failure, the spironolactone prescription rate significantly increased after RALES publication (34 per 1000 patients in 1994 and 149 per 1000 patients in 2001). The rate of hospitalizations for hyperkalemia significantly rose from 2.4 per 1000 patients (1994) to 11 per 1000 patients (2001). The associated mortality significantly rose from 0.2 per 1000 (1994) to 2 per 1000 (2001). The authors concluded that closer laboratory monitoring may be necessary, in addition to proper prescribing of spironolactone. The ACC/AHA 2005 Heart Failure Guidelines emphasize factors to consider in minimizing the risk of hyperkalemia such as initial dosages to use, avoidance of NSAIDs, discontinuing or reducing potassium supplements, and following monitoring guidelines. They suggest that potassium levels and renal function be checked in 3 days and at 1 week after initiation of therapy and at least monthly for the first 3 months. If serum potassium increases to a level of >5.4 mEq/L while on spironolactone, dose reduction is suggested. The RALES trial used 25 mg every other day as the lowest maintenance dose possible.

Hypertension: Aldosterone antagonists may add additional antihypertensive benefits in patients who have severe LV dysfunction (NYHA class III and IV), but only after ACE inhibitors and beta-blockers have been instituted (if no contraindications or intolerances exist).

Anesthesia and Critical Care Concerns/Other ConsiderationsIn severe heart failure, spironolactone (25 mg/day), when combined with maximal standard therapy, resulted in a striking improvement in cardiovascular outcome (*N Engl J Med*, 1999, 341:709-17).

Potassium levels should be monitored in patients on an aldosterone blocker, particularly in those who have underlying renal impairment or concurrent ACE inhibitor therapy.

Stanford V Regimen

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pharmacologic Category Chemotherapy Regimen, Lymphoma, Hodgkin's Disease

Regimen Use Lymphoma, Hodgkin's disease

Regimen NOTE: Multiple variations are listed below.

Variation 1:

Mechlorethamine: I.V.: 6 mg/m^2 day 1

[total dose/cycle = 6 mg/m^2]

Doxorubicin: I.V.: 25 mg/m^2/day days 1 and 15

[total dose/cycle = 50 mg/m^2]

Vinblastine: I.V.: 6 mg/m^2/day days 1 and 15

[total dose/cycle = 12 mg/m^2]

Vincristine: I.V.: 1.4 mg/m^2/day (maximum 2 mg) days 8 and 22

[total dose/cycle = 2.8 mg/m^2; maximum 4 mg]

Bleomycin: I.V.: 5 units/m^2/day days 8 and 22

[total dose/cycle = 10 units/m^2]

Etoposide: I.V.: 60 mg/m^2/day days 15 and 16

[total dose/cycle = 120 mg/m^2]

Prednisone: Oral: 40 mg/m^2 every other day for 9 weeks

followed by tapering of dose by 10 mg every other day, beginning at week 10

Repeat cycle every 28 days for 3 cycles; **Note:** In cycle 3, for patients ≥50 years of age, decrease vinblastine dose to 4 mg/m^2/dose and decrease vincristine dose to 1 mg/m^2/dose

Variation 2:

Mechlorethamine: I.V.: 6 mg/m^2/dose weeks 1, 5, and 9

[total dose/cycle = 18 mg/m^2]

Doxorubicin: I.V.: 25 mg/m^2/dose weeks 1, 3, 5, 7, 9, and 11

[total dose/cycle = 150 mg/m^2]

Vinblastine: I.V.: 6 mg/m^2/dose weeks 1, 3, 5, 7, 9, and 11

[total dose/cycle = 36 mg/m^2]

Vincristine: I.V.: 1.4 mg/m^2/dose (maximum 2 mg) weeks 2, 4, 6, 8, 10, and 12

[total dose/cycle = 8.4 mg/m^2; maximum 12 mg]

Bleomycin: I.V.: 5 units/m^2/dose weeks 2, 4, 6, 8, 10, and 12

[total dose/cycle = 30 units/m^2]

Etoposide: I.V.: 60 mg/m^2/day for 2 consecutive days, weeks 3, 7, and 11

[total dose/cycle = 360 mg/m^2]

Prednisone: Oral: 40 mg/m^2 every other day for 10 weeks

[total dose prior to taper = 1400 mg/m^2]

followed by tapering of prednisone dose during weeks 11 and 12

Treatment cycle is 12 weeks

Medication Safety Issues

Sound-alike/look-alike issues:

Zerit® may be confused with Ziac®

Pronunciation(STAV yoo deen)

U.S. Brand NamesZerit®

Canadian Brand NamesZerit®

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleoside)

Use: Labeled IndicationsTreatment of HIV infection in combination with other antiretroviral agents

Dosing: Adults**HIV infection (in combination with other antiretrovirals):** Oral:

≥60 kg: 40 mg every 12 hours

<60 kg: 30 mg every 12 hours

Dosing: ElderlyOlder patients should be closely monitored for signs and symptoms of peripheral neuropathy. Dosage should be carefully adjusted to renal function.

Dosing: Pediatric**HIV infection:** Oral:

Newborns (Birth to 13 days): 0.5 mg/kg every 12 hours

Children:

- >14 days and <30 kg: 1 mg/kg every 12 hours
- ≥30 kg: 30 mg every 12 hours

Dosing: Renal Impairment

Children: Specific recommendations not available. Reduction in dose or increase in dosing interval should be considered.

Adults:

- Cl_{cr} >50 mL/minute:
  - ≥60 kg: 40 mg every 12 hours
  - <60 kg: 30 mg every 12 hours
- Cl_{cr} 26-50 mL/minute:
  - ≥60 kg: 20 mg every 12 hours
  - <60 kg: 15 mg every 12 hours
- Cl_{cr} 10-25 mL/minute, hemodialysis (administer dose after hemodialysis on day of dialysis):
  - ≥60 kg: 20 mg every 24 hours
  - <60 kg: 15 mg every 24 hours

Dosing: Adjustment for ToxicityIf symptoms of peripheral neuropathy occur, discontinue until symptoms resolve. Treatment may then be resumed at 50% the recommended dose. If symptoms recur at lower dose, permanent discontinuation should be considered.

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered without regard to meals. Oral solution should be shaken vigorously prior to use.

Dietary ConsiderationsMay be taken without regard to meals. Oral solution contains sucrose 50 mg/mL.

StorageCapsules and powder for reconstitution may be stored at controlled room temerature of 25°C (77°F). Reconstituted oral solution should be stored in refrigerator at 2°C to 8°C (36°F to 46°F) and is stable for 30 days.

ReconstitutionReconstitute powder for oral suspension with 202 mL of purified water as specified on the bottle. Shake vigorously until suspended. Final suspension will be 1 mg/mL (200 mL).

ContraindicationsHypersensitivity to stavudine or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Lactic acidosis/hepatomegaly: See "Concerns related to adverse effects" below.
- Pancreatitis: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Lactic acidosis/hepatomegaly: **[U.S Boxed Warning]: Lactic acidosis and severe hepatomegaly with steatosis have been reported with nucleoside analogues, including fatal cases;** combination therapy with didanosine may increase risk; use with caution in patients with risk factors for liver disease (although acidosis has occurred in patients without known risk factors, risk may be increased with female gender, obesity, pregnancy, or prolonged exposure). Suspend treatment in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or hepatotoxicity (transaminase elevation may/may not accompany hepatomegaly and steatosis).
- Motor weakness: Severe motor weakness (resembling Guillain-Barré syndrome) has been reported (including fatal cases, usually in association with lactic acidosis); manufacturer recommends discontinuation if motor weakness develops (with or without lactic acidosis).
- Pancreatitis: **[U.S. Boxed Warning]: Pancreatitis (including some fatal cases) has occurred during combination therapy with didanosine (with or without hydroxyurea).** Suspend therapy with agents toxic to the pancreas (including stavudine, didanosine, or hydroxyurea) in patients with suspected pancreatitis.
- Peripheral neuropathy: The dose-limiting side effect, may be peripheral neuropathy; use with caution in patients with pre-existing peripheral neuropathy. If neuropathy recurs after interruption and reinitiation of therapy (at a reduced dose), consider permanent discontinuation.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with pre-existing bone marrow suppression.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.

Concurrent drug therapy issues:

- Combination with didanosine (with or without hydroxyurea): May increase risk of hepatotoxicity/pancreatitis; avoid this combination.
- Interferon alfa: Use with caution in combination with interferon alfa with or without ribavirin in HIV/HBV coinfected patients; monitor closely for hepatic decompensation, anemia, or neutropenia; dose reduction or discontinuation of interferon and/or ribavirin may be required if toxicity evident.
- Zidovudine: Should not use zidovudine in combination with stavudine.

Pregnancy Risk FactorC

Pregnancy ConsiderationsNo increased risk of overall birth defects has been observed following 1st trimester exposure according to data collected by the antiretroviral pregnancy registry. Cases of fatal and nonfatal lactic acidosis, with or without pancreatitis, have been reported in pregnant women. It is not known if pregnancy itself potentiates this known side effect; however, pregnant women may be at increased risk of lactic acidosis and liver damage. Combination treatment with didanosine may also contribute to the risk of lactic acidosis, and should be considered only if benefit outweighs risk. Hepatic enzymes and electrolytes should be monitored frequently during the 3rd trimester of pregnancy. Pharmacokinetics of stavudine are not significantly altered during pregnancy; dose adjustments are not needed. There are no adequate and well-controlled studies in pregnant women; however, the Perinatal HIV Guidelines Working Group considers stavudine to be an alternative NRTI in dual nucleoside combination regimens; use with didanosine only if no alternatives are available, do not use with zidovudine. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse ReactionsAdverse reactions reported below represent experience with combination therapy with other nucleoside analogues and protease inhibitors.

>10%:

Central nervous system: Headache (25% to 46%)

Dermatologic: Rash (18% to 30%)

Gastrointestinal: Nausea (43% to 53%; less than comparator group), vomiting (18% to 30%; less than comparator group), diarrhea (34% to 45%)

Hepatic: Hyperbilirubinemia (65% to 68%; grade 3/4: 7% to 16%), AST increased (42% to 53%; grade 3/4: 5% to 7%), ALT increased (40% to 50%; grade 3/4: 6% to 8%), GGT increased (15% to 28%; grade 3/4: 2% to 5%)

Neuromuscular & skeletal: Peripheral neuropathy (8% to 21%)

Miscellaneous: Amylase increased (21% to 31%; grade 3/4: 4% to 8%), lipase increased (~27%; grade 3/4: 5% to 6%)

Postmarketing and/or case reports: Abdominal pain, allergic reaction, anemia, anorexia, chills, diabetes mellitus, fever, hepatic failure, hepatitis, hepatomegaly (with steatosis; some fatal), hyperglycemia, hyperlactatemia (symptomatic), immune reconstitution syndrome, insomnia, lactic acidosis (some fatal), leukopenia, macrocytosis, motor weakness (severe), myalgia, pancreatitis, redistribution/accumulation of body fat, thrombocytopenia

Drug Interactions

Didanosine: Stavudine may enhance the adverse/toxic effect of Didanosine. Lactic acidosis (possibly fatal) is of particular concern. *Risk D: Consider therapy modification*

DOXOrubicin: May diminish the therapeutic effect of Stavudine. *Risk D: Consider therapy modification*

DOXOrubicin (Liposomal): May diminish the therapeutic effect of Stavudine. *Risk D: Consider therapy modification*

Ribavirin: May enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Zidovudine: May diminish the therapeutic effect of Stavudine. *Risk D: Consider therapy modification*

Monitoring ParametersMonitor liver function tests and renal function tests; signs and symptoms of peripheral neuropathy; monitor viral load and CD4 count

Nursing: Physical Assessment/MonitoringAssess closely for any previous allergy history prior to beginning treatment. Assess other pharmacological or herbal products patient may be taking for potential interactions or toxicity; dosing adjustments may be necessary. **Note:** Patient must be monitored frequently during therapy for any sign of adverse response (eg, peripheral neuropathy, lactic acidosis, hepatomegaly, motor weakness) that may require suspension of therapy. Assess effectiveness of therapy (decrease in infections and progress of disease, viral load) periodically during therapy. Teach patient proper use (eg, timing of multiple medications and drugs that should not be used concurrently), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsLiver function, renal function tests, viral load

Patient EducationDo not take any new prescription, over-the-counter medications, or herbal products without consulting prescriber. This drug will not cure HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. This drug is prescribed as one part of a multidrug combination; take exactly as directed, for full course of therapy. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. You may be susceptible to infection (avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber). Frequent blood tests may be required with prolonged therapy. May cause dizziness or weakness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report immediately any tingling, pain, or loss of sensation in toes, feet, muscles or joints; swollen glands; alterations in urinary pattern; swelling of extremities, weight gain, or other persistent adverse effects. If you are instructed to stop the medication, do not restart without specific instruction by your prescriber. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 15 mg, 20 mg, 30 mg, 40 mg

Zerit®: 15 mg, 20 mg, 30 mg, 40 mg

Powder for solution, oral:

Zerit®: 1 mg/mL (200 mL) [dye free; contains sucrose 50 mg/mL; fruit flavor]

Generic AvailableYes: Capsule

ManufacturerBristol-Myers Squibb Company (Pharmaceutical Division)

Pricing: U.S. (www.drugstore.com)

Capsules (Zerit)

15 mg (60): $349.97

20 mg (60): $359.96

30 mg (60): $385.97

40 mg (60): $395.99

Solution (reconstituted) (Zerit)

1 mg/mL (200): $79.98

Mechanism of ActionStavudine is a thymidine analog which interferes with HIV viral DNA dependent DNA polymerase resulting in inhibition of viral replication; nucleoside reverse transcriptase inhibitor

Pharmacodynamics/Kinetics

Distribution: V_d: 46 L

Bioavailability: 86.4%

Metabolism: Undergoes intracellular phosphorylation to an active metabolite

Half-life elimination: 1.2-1.6 hours

Time to peak, serum: 1 hour

Excretion: Urine (42% as unchanged drug)

Related Information

- Antiretroviral Agents
- Antiretroviral Therapy for HIV Infection: Adults and Adolescents
- Management of Healthcare Worker Exposures to HBV, HCV, and HIV
- Perinatal HIV Guidelines

Pharmacotherapy PearlsPotential compliance problems, frequency of administration and adverse effects should be discussed with patients before initiating therapy to help prevent the emergence of resistance.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness, insomnia, anxiety, or depression

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine; concurrent use with lithium may increase the risk of peripheral neuropathy

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Streptomycin may be confused with streptozocin

Pronunciation(strep toe MYE sin)

Pharmacologic CategoryAntibiotic, Aminoglycoside; Antitubercular Agent

Use: Labeled IndicationsPart of combination therapy of active tuberculosis; used in combination with other agents for treatment of streptococcal or enterococcal endocarditis, mycobacterial infections, plague, tularemia, and brucellosis

Dosing: Adults

Brucellosis: I.M.: 1 g/day for 14-21 days (with doxycycline, 100 mg twice daily for 6 weeks)

Endocarditis: I.M.:

Enterococcal: 1 g every 12 hours for 2 weeks, 500 mg every 12 hours for 4 weeks in combination with penicillin

Streptococcal: 1 g every 12 hours for 1 week

***Mycobacterium avium*complex:** I.M.: Adjunct therapy (with macrolide, rifamycin, and ethambutol): 15 mg/kg 3 times/week for first 2-3 months for severe disease

Plague: I.M.: 15 mg/kg (or 1 g) every 12 hours until the patient is afebrile for at least 3 days

Tuberculosis: I.M.:

Daily therapy: 15 mg/kg/day (maximum: 1 g)

Directly observed therapy (DOT), twice weekly: 25-30 mg/kg (maximum: 1.5 g)

Directly observed therapy (DOT), 3 times/week: 25-30 mg/kg (maximum: 1.5 g)

Tularemia: I.M.: 10-15 mg/kg every 12 hours (maximum: 2 g/day) for 7-10 days or until patient is afebrile for 5-7 days

Dosing: ElderlyI.M.: 10 mg/kg/day, not to exceed 750 mg/day; dosing interval should be adjusted for renal function. Some authors suggest not to give more than 5 days/week or give as 20-25 mg/kg/dose twice weekly.

Dosing: Pediatric

Tuberculosis: I.M.:

Daily therapy: 20-40 mg/kg/day (maximum: 1 g/day)

Directly observed therapy (DOT), twice weekly: 25-30 mg/kg (maximum: 1.5 g)

Directly observed therapy DOT, 3 times/week: 25-30 mg/kg (maximum: 1.5 g)

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer every 24-72 hours.

Cl_{cr} <10 mL/minute: Administer every 72-96 hours.

Removed by hemo- and peritoneal dialysis: Administer dose postdialysis.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Inject deep I.M. into large muscle mass.

Administration: I.V.I.V. administration is not recommended. Has been administered intravenously over 30-60 minutes.

Administration: I.V. DetailpH: 5-8 (injection)

StorageDepending upon manufacturer, reconstituted solution remains stable for 2-4 weeks when refrigerated and 24 hours at room temperature. Exposure to light causes darkening of solution without apparent loss of potency.

Compatibility

Y-site administration: Compatible: Esmolol.

Compatibility in syringe: Compatible: Penicillin G sodium. **Incompatible:** Heparin. **Variable (consult detailed reference):** Ampicillin.

Compatibility when admixed: Compatible: Bleomycin. **Incompatible:** Amobarbital, amphotericin B, chlorothiazide, heparin, methohexital, norepinephrine, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate.

ContraindicationsHypersensitivity to streptomycin or any component of the formulation; pregnancy

Warnings/Precautions

Boxed warnings:

- Nephrotoxicity: See "Concerns related to adverse effects" below.
- Neuromuscular blockade and respiratory paralysis: See "Concerns related to adverse effects" below.
- Neurotoxicity: See "Concerns related to adverse effects" below.
- Parenteral formulation: See "Dosage form specific issues" below.

Concerns related to adverse effects:

- Nephrotoxicity: **[U.S. Boxed Warning]: May cause nephrotoxicity;** usual risk factors include pre-existing renal impairment, concomitant nephrotoxic medications, advanced age and dehydration. Discontinue treatment if signs of nephrotoxicity occur; renal damage is usually reversible.
- Neuromuscular blockade and respiratory paralysis: **[U.S. Boxed Warning]: May cause neuromuscular blockade and respiratory paralysis;** especially when given soon after anesthesia or muscle relaxants.
- Neurotoxicity: **[U.S. Boxed Warning]: May cause neurotoxicity;** usual risk factors include pre-existing renal impairment, concomitant neuro-/nephrotoxic medications, advanced age and dehydration. Ototoxicity is proportional to the amount of drug given and the duration of treatment. Tinnitus or vertigo may be indications of vestibular injury and impending bilateral irreversible damage. Discontinue treatment if signs of ototoxicity occur.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hearing impairment: Use with caution in patients with pre-existing vertigo, tinnitus, or hearing loss.
- Neuromuscular disorders: Use with caution in patients with neuromuscular disorders, including myasthenia gravis.
- Renal impairment: Use with caution in patients with pre-existing renal insufficiency; dosage modification required.

Dosage form specific issues:

- Parenteral formulation: **[U.S. Boxed Warning]: Parenteral form should be used only where appropriate audiometric and laboratory testing facilities are available.**

Geriatric ConsiderationsStreptomycin is indicated for persons from endemic areas of drug-resistant *Mycobacterium tuberculosis* or who are HIV infected. Since most older patients acquired the *M. tuberculosis* infection prior to the availability of effective chemotherapy, isoniazid and rifampin are usually effective unless resistant organisms are suspected or the patient is HIV infected. Adjust dose interval for renal function.

Pregnancy Risk FactorD

Pregnancy ConsiderationsStreptomycin crosses the placenta. Many case reports of hearing impairment in children exposed *in utero* have been published. Impairment has ranged from mild hearing loss to bilateral deafness. Because of several reports of total irreversible bilateral congenital deafness in children whose mothers received streptomycin during pregnancy, the manufacturer classifies streptomycin as pregnancy risk factor D.

LactationEnters breast milk/not recommended (AAP rates "compatible")

Breast-Feeding ConsiderationsStreptomycin is excreted into breast milk; however, it is not well absorbed when taken orally. This limited oral absorption may minimize exposure to the nursing infant. Nondose-related effects could include modification of bowel flora. The AAP considers streptomycin to be "usually compatible with breast-feeding."

Pregnancy & Lactation, In-Depth

- Streptomycin in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension

Central nervous system: Neurotoxicity, drowsiness, headache, drug fever, paresthesia

Dermatologic: Skin rash

Gastrointestinal: Nausea, vomiting

Hematologic: Eosinophilia, anemia

Neuromuscular & skeletal: Arthralgia, weakness, tremor

Otic: Ototoxicity (auditory), ototoxicity (vestibular)

Renal: Nephrotoxicity

Respiratory: Difficulty in breathing

Drug Interactions

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Test InteractionsFalse-positive urine glucose with Benedict's solution or Clinitest®; penicillin may decrease aminoglycoside serum concentrations *in vitro*

Monitoring ParametersHearing (audiogram), BUN, creatinine; serum concentration of the drug should be monitored in all patients; eighth cranial nerve damage is usually preceded by high-pitched tinnitus, roaring noises, sense of fullness in ears, or impaired hearing and may persist for weeks after drug is discontinued

Reference RangeTherapeutic: Peak: 20-30 mcg/mL; Trough: <5 mcg/mL; Toxic: Peak: >50 mcg/mL; Trough: >10 mcg/mL

Nursing: Physical Assessment/MonitoringAssess for allergy history prior to starting therapy. Assess potential for interactions with other pharmacological agents patient may be taking (eg, increased risk of toxicity with other nephrotoxic or ototoxic drugs). Assess results of laboratory tests, effectiveness (resolution of infection), and adverse effects (eg, ototoxicity [auditory or vestibular], neurotoxicity [drowsiness, paresthesia], nephrotoxicity [I & O, hematuria, edema]) on a regular basis during therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsHearing (audiogram), BUN, creatinine; serum concentration of the drug should be monitored. Perform culture and sensitivity prior to initiating therapy.

Patient EducationDo not take any new medication during therapy without consulting prescriber. This medication can only be given by intramuscular injection. Therapy for TB may last several months. Do not discontinue even if you are feeling better. Maintain adequate hydration (2-3 L/day of fluids unless instructed to restrict fluid intake). May cause headache or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea, vomiting, or loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report immediately change in hearing or sense of fullness in ears; pain, weakness, tremors, or numbness in muscles; unusual clumsiness or change in strength or altered gait; change in urinary pattern or back pain; persistent diarrhea; or respiratory difficulty or chest pain. **Pregnancy precaution:** Do not get pregnant while taking this medication. Consult prescriber for appropriate barrier contraceptive measures.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 1 g

Generic AvailableYes

Mechanism of ActionInhibits bacterial protein synthesis by binding directly to the 30S ribosomal subunits causing faulty peptide sequence to form in the protein chain

Pharmacodynamics/Kinetics

Absorption:

Oral: Poorly absorbed

I.M.: Well absorbed

Distribution: To extracellular fluid including serum, abscesses, ascitic, pericardial, pleural, synovial, lymphatic, and peritoneal fluids; poorly distributed into CSF

Protein binding: 34%

Half-life elimination: Newborns: 4-10 hours; Adults: 2-4.7 hours, prolonged with renal impairment

Time to peak: I.M.: Within 1 hour

Excretion: Urine (90% as unchanged drug); feces, saliva, sweat, and tears (<1%)

Medication Safety Issues

Sound-alike/look-alike issues:

Streptozocin may be confused with streptomycin

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(strep toe ZOE sin)

U.S. Brand NamesZanosar®

Canadian Brand NamesZanosar®

Pharmacologic CategoryAntineoplastic Agent, Alkylating Agent

Use: Labeled IndicationsTreatment of metastatic islet cell carcinoma of the pancreas, carcinoid tumor and syndrome, Hodgkin's disease, palliative treatment of colorectal cancer

Dosing: Adults**Antineoplastic:** Refer to individual protocols.

Single agent therapy: I.V.: 1-1.5 g/m^2 weekly for 6 weeks followed by a 4-week rest period

Combination therapy: I.V.: 0.5-1 g/m^2 for 5 consecutive days followed by a 4- to 6-week rest period

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Dosing: Renal ImpairmentThe FDA-approved labeling does not contain dosing adjustments; however, it is recommended to use clinical judgment weighing benefit vs risk of renal toxicity in patients with pre-existing renal impairment. The following dosing adjustments have been used by some clinicians (Aronoff, 2007): Adults:

Cl_{cr} 10-50 mL/minute: Administer 75% of dose

Cl_{cr} <10 mL/minute: Administer 50% of dose

Dosing: Hepatic ImpairmentThere are no specific guidelines on dosage adjustment in patients with hepatic impairment. Streptozocin is rapidly hepatically metabolized; dose should be decreased in patients with severe liver disease.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Administer as short (30-60 minutes) or 6-hour infusion; may be given by rapid I.V. push

Administration: I.V. DetailpH: 3.5-4.5

StorageStore intact vials under refrigeration. Vials are stable for 1 year at room temperature. Solution reconstituted with SWFI or NS is stable for 48 hours at room temperature and 96 hours under refrigeration. Further dilution in D_5W or NS is stable for 48 hours at room temperature and 96 hours under refrigeration when protected from light.

ReconstitutionDilute powder with 9.5 mL SWFI or NS to a concentration of 100 mg/mL.

CompatibilityStable in D_5W, NS.

Y-site administration: Compatible: Amifostine, etoposide phosphate, filgrastim, gemcitabine, granisetron, melphalan, ondansetron, teniposide, thiotepa, vinorelbine. **Incompatible:** Allopurinol, aztreonam, cefepime, piperacillin/tazobactam.

ContraindicationsPregnancy

Allergy Considerations

- Nitrosourea Allergy

Warnings/Precautions

Boxed warnings:

- Dose-related toxicities: See “Concerns related to adverse effects” below.

- Experienced physician: See “Other warnings/precautions” below.
- Renal toxicity: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Dose-related toxicities: **[U.S. Boxed Warning]: Other major toxicities include liver dysfunction, diarrhea, nausea, and vomiting.**
- Insulin release: There may be an acute release of insulin during treatment; keep syringe of $D_{50}W$ at bedside during administration.
- Renal toxicity: **[U.S. Boxed Warning]: Renal toxicity is dose-related and cumulative and may be severe or fatal.**

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**
- Extravasation/tissue irritation: Local tissue irritation may occur; extravasation may cause local tissue lesions and necrosis.

Pregnancy Risk FactorD

LactationEnters breast milk/contraindicated

Adverse Reactions

>10%:

Gastrointestinal: Nausea and vomiting (100%)

Hepatic: Increased LFTs

Miscellaneous: Hypoalbuminemia

Renal: BUN increased, Cl_{cr} decreased, hypophosphatemia, nephrotoxicity (25% to 75%), proteinuria, renal dysfunction (65%), renal tubular acidosis

1% to 10%:

Endocrine & metabolic: Hypoglycemia (6%)

Gastrointestinal: Diarrhea (10%)

Local: Pain at injection site

<1%: Confusion, lethargy, depression, leukopenia, thrombocytopenia, liver dysfunction, secondary malignancy

Myelosuppressive:

WBC: Mild

Platelets: Mild

Onset: 7 days

Nadir: 14 days

Recovery: 21 days

Oncology: VesicantPossibly; see Management of Drug Extravasations.

Oncology: Emetic PotentialVery high (>90%)

Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersMonitor renal function closely

Nursing: Physical Assessment/MonitoringAntiemetic should be administered prior to therapy (emetic potential 100%). Assess potential for interactions with other pharmacological agents. See Administration for infusion specifics. Infusion site should be monitored closely to prevent extravasation. Assess results of laboratory tests at baseline and weekly during therapy. Evaluate therapeutic response and adverse reactions (eg, nephrotoxicity/renal dysfunction [I & O, hematuria, edema, BUN], hepatotoxicity [jaundice, fatigue, LFTs], hypoglycemia, diarrhea [dehydration]) on a regular basis. Caution patients with diabetes to monitor glucose levels closely (may precipitate hypoglycemia). Teach patient (or caregiver) possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsLiver function tests, CBC, renal function tests (BUN, serum creatinine) at baseline and weekly during therapy

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug can only be given I.V.; report immediately any redness, swelling, pain, or burning at infusion site. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You will be more sensitive to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). If you have diabetes, monitor glucose levels closely; may cause hypoglycemia. May cause nausea and vomiting (consult prescriber for antiemetic); nervousness, dizziness, confusion, or lethargy (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or loss of body hair (reversible when treatment is finished). Report unusual back pain, change in urinary pattern; persistent fever, chills, or sore throat; unusual bleeding; blood in urine, vomitus, or stool; chest pain, palpitations, or respiratory difficulty; or swelling of feet or lower legs. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during or for 1 month following therapy. Male: Do not cause a female to become pregnant. Male/female: Consult prescriber for instruction on appropriate barrier contraceptive measures. This drug may cause severe fetal damage. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 1 g

Generic AvailableNo

Mechanism of ActionInterferes with the normal function of DNA by alkylation and cross-linking the strands of DNA, and by possible protein modification

Pharmacodynamics/Kinetics

Duration: Disappears from serum in 4 hours

Distribution: Concentrates in liver, intestine, pancreas, and kidney

Metabolism: Rapidly hepatic

Half-life elimination: 35-40 minutes

Excretion: Urine (60% to 70% as metabolites); exhaled gases (5%); feces (1%)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause lethargy, confusion, or depression

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; renal dysfunction occurs commonly with streptozocin; will need to monitor and adjust lithium and gabapentin doses

International Brand NamesZanosar (CH, FR, IL, NL, NO)

Strontium-89

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(STRON shee um atey nine)
U.S. Brand NamesMetastron®
Canadian Brand NamesMetastron®
Pharmacologic CategoryRadiopharmaceutical
Use: Labeled IndicationsRelief of bone pain in patients with skeletal metastases
Dosing: Adults**Bone pain:** I.V.: 148 megabecquerel (4 millicurie) administered by slow I.V. injection over 1-2 minutes or 1.5-2.2 megabecquerel (40-60 microcurie)/kg; repeated doses are generally not recommended at intervals <90 days; measure the patient dose by a suitable radioactivity calibration system immediately prior to administration
Dosing: ElderlyRefer to adult dosing.
StorageStore vial and its contents inside its transportation container at room temperature.
ContraindicationsHypersensitivity to any strontium-containing compounds or any other component of the formulation; pregnancy; breast-feeding
Warnings/Precautions

Special handling:

- Radioactive: Handle with caution, in a similar manner to other radioactive drugs; appropriate safety measures to minimize radiation to personnel should be instituted. Body fluids may remain radioactive up to one week after injection.

Concerns related to adverse effects:

- Bone pain: A small number of patients have experienced a transient increase in bone pain at 36-72 hours postdose; this reaction is generally mild and self-limiting.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with bone marrow suppression. Use with caution in patients whose platelet counts fall <60,000/mm^3 or whose white blood cell counts fall <2400/mm^3.

- Incontinence: Incontinent patients may require urinary catheterization.

- Renal impairment: Use with caution in patients with renal impairment; renally eliminated.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Not indicated for use in patients with cancer not involving bone.

Pregnancy Risk FactorD
Adverse ReactionsMost severe reactions of marrow toxicity can be managed by conventional means

Frequency not defined:

Cardiovascular: Flushing (most common after rapid injection)

Central nervous system: Fever and chills (rare)

Hematologic: Thrombocytopenia, leukopenia

Neuromuscular & skeletal: Increase in bone pain may occur (10% to 20% of patients)

Oncology: VesicantNo
Oncology: Emetic PotentialLow (<10%)
Drug InteractionsThere are no known significant interactions.
Monitoring ParametersRoutine blood tests
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as chloride [preservative free]:

Metastron®: 10.9-22.6 mg/mL (4 mL) [148 megabecquerel, 4 millicurie per vial]

Generic AvailableNo
Pharmacotherapy PearlsDuring the first week after injection, strontium-89 will be present in the blood and urine, therefore, the following common sense precautions should be instituted:

1. Where a normal toilet is available, use in preference to a urinal, flush the toilet twice

2. Wipe away any spilled urine with a tissue and flush it away

3. Have patient wash hands after using the toilet

4. Immediately wash any linen or clothes that become stained with blood or urine

5. Wash away any spilled blood if a cut occurs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsStrontium-89 Chloride

Pronunciation(SUKS si mer)
U.S. Brand NamesChemet®
Canadian Brand NamesChemet®
Pharmacologic CategoryAntidote
Use: Labeled Indications Treatment of lead poisoning in children with serum lead levels >45 mcg/dL
Use: Unlabeled/Investigational

Treatment of lead poisoning in symptomatic adults

Dosing: AdultsFor the treatment of high blood lead levels in adults, the CDC guidelines recommend chelation therapy with blood lead levels >50 mcg/dL and significant symptoms; chelation therapy may also be indicated with blood lead levels ≥100 mcg/dL and/or symptoms. (Kosnett, 2007).

Mild symptoms or blood lead levels 70-100 mg/dL; unlabeled use: 10 mg/kg/dose (or 350 mg/m^2/dose) every 8 hours for 5 days, followed by 10 mg/kg/dose (or 350 mg/m^2/dose) every 12 hours for 14 days; Maximum: 500 mg/dose

Note: Treatment courses may be repeated, but 2-week intervals between courses is generally recommended.

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricFor the treatment of high blood lead levels in children, the CDC recommends chelation treatment when blood lead levels are >45 mcg/dL (CDC, 2002). Children with blood lead levels >70 mcg/dL or symptomatic lead poisoning should be treated with parenteral agents (AAP, 2005).

Oral: 10 mg/kg/dose (or 350 mg/m^2/dose) every 8 hours for 5 days followed by 10 mg/kg/dose (or 350 mg/m^2/dose) every 12 hours for 14 days. Maximum: 500 mg/dose. For children <5 years of age, dose should be based on mg/m^2; dosing by mg/kg may be suboptimal.

Note: Treatment courses may be repeated, but 2-week intervals between courses is generally recommended.

Dosing: Renal ImpairmentAdminister with caution and monitor closely.
Dosing: Hepatic ImpairmentAdminister with caution and monitor closely
Administration: OralCapsule can be separated and contents sprinkled on a small amount of soft food, or the contents placed on a spoon and administered followed by fruit drink.
StorageStore between 15°C to 25°C (59°F to 77°F); avoid excessive heat.
ContraindicationsHypersensitivity to succimer or any component of the formulation
Warnings/Precautions

Disease-related concerns:

- Lead poisoning: Investigate, identify, and remove sources of lead exposure prior to treatment. Succimer is not used to prevent lead poisoning. Primary care providers should consult experts in chemotherapy of lead toxicity before using chelation drug therapy.
- Encephalopathy: Succimer does not cross blood brain barrier and should not be used to treat encephalopathy associated with lead toxicity.
- Hepatic impairment: Use with caution in patients with hepatic impairment; monitor serum transaminase levels closely.
- Renal impairment: Use with caution in patients with renal impairment. Succimer is dialyzable, however, the lead chelates are not.

Other warnings/precautions:

- Hydration: Adequate hydration should be maintained during therapy.
- Rebounding serum lead levels: May occur after treatment as lead is released from storage sites into blood. Severity of rebound may guide intensity of future monitoring.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAdverse events were observed in animal reproduction studies. Following maternal occupational exposure, lead crosses the placenta in amounts related to maternal plasma levels. Possible outcomes of maternal lead exposure >10 mcg/dL includes spontaneous abortion, postnatal developmental delay, and reduced birth weight. Chelation therapy during pregnancy is for maternal benefit only and should be limited to the treatment of severe, symptomatic lead poisoning.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsIt is not known if succimer is found in breast milk. The amount of lead in breast milk may range from 0.6% to 3% of the maternal serum concentration. Calcium supplementation may reduce the amount of lead in breast milk.
Adverse Reactions**Note:** Percentages as reported in pediatric patients unless otherwise noted.

>10%: Gastrointestinal: Appetite decreased, diarrhea, hemorrhoid symptoms, metallic taste, loose stools, nausea, vomiting

1% to 10%:

Cardiovascular: Arrhythmia (adults 2%)

Central nervous system: Chills, dizziness, drowsiness, fatigue, fever, headache, sleepiness

Dermatologic: Rash (including papular rash, herpetic rash and mucocutaneous eruptions); pruritus

Endocrine & metabolic: Cholesterol increased

Gastrointestinal: Abdominal cramps, mucosal irritation, sore throat

Genitourinary: Proteinuria (adults), urine output decreased (adults), voiding difficulty (adults)

Hepatic: Alkaline phosphatase increased, ALT increased, AST increased

Neuromuscular & skeletal: Back pain, flank pain, leg pain (adults), neuropathy, paresthesia, rib pain

Ocular: Cloudy film in eye, watery eyes

Otic: Otitis media, plugged ears

Respiratory: Cough, nasal congestion, rhinorrhea

Miscellaneous: Flu-like syndrome, moniliasis

<1%, postmarketing, and/or case reports: Allergic reactions (especially with retreatment), eosinophilia, neutropenia (causal relationship not established)

Drug Interactions There are no known significant interactions.

Test Interactions False-positive ketones (U) using nitroprusside methods, falsely decreased serum CPK; falsely decreased uric acid measurement

Monitoring Parameters Blood lead levels (baseline and 7-21 days after completing chelation therapy); serum aminotransferase, CBC with differential, platelets (baseline, and weekly during treatment); hemoglobin or hematocrit, iron status, free erythrocyte protoporphyrin or zinc protoporphyrin; neurodevelopmental changes

Monitoring: Lab Tests Blood lead levels (baseline and 7-21 days after completing chelation therapy); serum aminotransferase, CBC with differential, platelets (baseline, and weekly during treatment); hemoglobin or hematocrit, iron status, free erythrocyte protoporphyrin or zinc protoporphyrin

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Chemet®:100 mg

Generic Available No

Mechanism of Action Succimer is an analog of dimercaprol. It forms water soluble chelates with heavy metals which are subsequently excreted renally. Succimer binds heavy metals; however, the chemical form of these chelates is not known.

Pharmacodynamics/Kinetics

Absorption: Rapid but incomplete

Protein binding: Highly bound to albumin

Metabolism: Rapidly and extensively to mixed succimer cysteine disulfides

Half-life elimination: 2 days

Time to peak, serum: ~1-2 hours

Excretion: Urine (~25%) with peak urinary excretion between 2-4 hours (90% as mixed succimer-cysteine disulfide conjugates, 10% as unchanged drug); feces (as unabsorbed drug)

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause drowsiness or dizziness

Mental Health: Effects on Psychiatric Treatment None reported

Index Terms DMSA

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(suks in il KOE leen)

U.S. Brand NamesAnectine®; Quelicin®

Canadian Brand NamesQuelicin®

Pharmacologic CategoryNeuromuscular Blocker Agent, Depolarizing

Use: Labeled IndicationsAdjunct to general anesthesia to facilitate both rapid sequence and routine endotracheal intubation and to relax skeletal muscles during surgery; to reduce the intensity of muscle contractions of pharmacologically- or electrically-induced convulsions; does not relieve pain or produce sedation

Dosing: Adults**Neuromuscular blockade:** I.M., I.V.: Dose to effect; doses will vary due to interpatient variability; use ideal body weight for obese patients

I.M.: Up to 3-4 mg/kg, total dose should not exceed 150 mg

I.V.: Initial:

Short surgical procedures: 0.6 mg/kg (range 0.3-1.1 mg/kg)

Long surgical procedures:

Continuous infusion: 2.5-4.3 mg/minute; adjust dose based on response

Intermittent: Initial: 0.3-1.1 mg/kg; maintenance: 0.04-0.07 mg/kg/dose as required

Note: Initial dose of succinylcholine must be increased when nondepolarizing agent pretreatment used because of the antagonism between succinylcholine and nondepolarizing neuromuscular-blocking agents.

Dose adjustment with reduced plasma cholinesterase activity: Administer a test dose of 5-10 mg to evaluate sensitivity, or cautiously administer 1 mg/mL by slow I.V. infusion to produce neuromuscular blockade

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Neuromuscular blockade:** I.M., I.V.: Dose to effect; doses will vary due to interpatient variability; use ideal body weight for obese patients

I.M.: Children: Refer to adult dosing.

I.V.: Children: **Note:** Because of the risk of malignant hyperthermia, use of continuous infusions is not recommended in infants and children

Smaller Children: Intermittent: Initial: 2 mg/kg/dose one time; maintenance: 0.3-0.6 mg/kg/ dose every 5-10 minutes as needed

Older Children and Adolescents: Intermittent: Initial: 1 mg/kg/dose one time; maintenance: 0.3-0.6 mg/kg every 5-10 minutes as needed

Note: Initial dose of succinylcholine must be increased when nondepolarizing agent pretreatment used because of the antagonism between succinylcholine and nondepolarizing neuromuscular-blocking agents.

Dosing: Hepatic ImpairmentDose should be reduced in patients with severe liver disease.

Calculations

- Succinylcholine

Administration: I.M.I.M. injections should be made deeply, preferably high into deltoid muscle. Use only when I.V. access is not available.

Administration: I.V.May be given by rapid I.V. injection without further dilution.

Administration: I.V. DetailpH: 3.0-4.5

StorageRefrigerate at 2°C to 8°C (36°F to 46°F); however, stable for ≤3 months unrefrigerated (25°C). Stability of parenteral admixture (1-2 mg/mL) at refrigeration temperature (4°C) is 24 hours in D_5W or NS.

ReconstitutionMay dilute to a final concentration of 1-2 mg/mL. Do not mix with alkaline solutions (pH >8.5).

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, LR, ${}^1/_2NS$, NS.

Y-site administration: Compatible: Etomidate, heparin with hydrocortisone sodium succinate, potassium chloride, propofol, vitamin B complex with C. **Incompatible:** Thiopental.

Compatibility in syringe: Compatible: Heparin.

Compatibility when admixed: Compatible: Amikacin, isoproterenol, meperidine, methyldopate, morphine, norepinephrine, scopolamine. **Incompatible:** Methohexital, nafcillin, sodium bicarbonate, thiopental. **Variable (consult detailed reference):** Pentobarbital.

ContraindicationsHypersensitivity to succinylcholine or any component of the formulation; personal or familial history of malignant hyperthermia; myopathies associated with elevated serum creatine phosphokinase (CPK) values; acute phase of injury following major burns, multiple trauma, extensive denervation of skeletal muscle or upper motor neuron injury

Allergy Considerations

- Neuromuscular-Blocking Agent Allergy

Warnings/Precautions

Boxed warnings:

- Pediatrics: See "Special populations" below.

Concerns related to adverse effects:

- Bradycardia: Risk of bradycardia may be increased with second dose and may occur more in children. Occurrence may be reduced by pretreating with atropine

- Increased intraocular pressure (IOP): May increase IOP; use caution with narrow-angle glaucoma or penetrating eye injuries

- Malignant hyperthermia: Use may be associated with acute onset of malignant hyperthermia; risk may be increased with concomitant administration of volatile anesthetics.

- Vagal tone: May increase vagal tone.

Disease-related concerns:

- Burn injury: Use with caution in patients with extensive or severe burns; risk of hyperkalemia is increased following injury. Onset of time and duration of risk are variable, but risk is generally greatest 7-10 days after injury.

- Conditions which may antagonize neuromuscular blockade: Alkalosis, hypercalcemia, demyelinating lesions, peripheral neuropathies, denervation, infection, muscle trauma, and diabetes mellitus may result in antagonism of neuromuscular blockade.

- Conditions which may potentiate neuromuscular blockade: Electrolyte abnormalities, severe hyponatremia, severe hypocalcemia, severe hypokalemia, hypermagnesemia, neuromuscular diseases, acidosis, acute intermittent porphyria, Eaton-Lambert syndrome, myasthenia gravis, renal failure, and hepatic failure may result in potentiation of neuromuscular blockade.

- Hyperkalemia: Use with caution in patients with pre-existing hyperkalemia. Severe hyperkalemia may develop in patients with chronic abdominal infections, burn injuries, children with skeletal muscle myopathy, subarachnoid hemorrhage, or conditions which cause degeneration of the nervous system.

- Plasma pseudocholinesterase disorders: Metabolized by plasma cholinesterase; use with caution (if at all) in patients suspected of being homozygous for the atypical plasma cholinesterase gene. Plasma cholinesterase activity may also be reduced by burns, decompensated heart disease, infections, malignant tumors, myxedema, pregnancy, severe hepatic or renal dysfunction, ulcer, and certain medications and chemicals

Special populations:

- Elderly: Use with caution in the elderly, effects and duration are more variable.

- Pediatrics: **[U.S. Boxed Warning]: Use caution in children and adolescents. Acute rhabdomyolysis with hyperkalemia, ventricular arrhythmias and cardiac arrest have been reported (rarely) in children with undiagnosed skeletal muscle myopathy; occurs soon after administration and requires immediate treatment of hyperkalemia.** Prolonged resuscitation may be required. Use in children should be reserved for emergency intubation or where immediate airway control is necessary.

Other warnings/precautions:

- Appropriate use: Maintenance of an adequate airway and respiratory support is critical.

- Experienced personnel: Should be administered by adequately trained individuals familiar with its use.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted. Small amounts cross the placenta. Sensitivity to succinylcholine may be increased due to a ~24% decrease in plasma cholinesterase activity during pregnancy and several days postpartum.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

Frequency not defined.

Cardiovascular: Arrhythmias, bradycardia (higher with 2nd dose, more frequent in children), cardiac arrest, hyper-/hypotension, tachycardia

Dermatologic: Rash

Endocrine & metabolic: Hyperkalemia

Gastrointestinal: Salivation (excessive)

Neuromuscular & skeletal: Jaw rigidity, muscle fasciculation, postoperative muscle pain, rhabdomyolysis (with possible myoglobinuric acute renal failure)

Ocular: Intraocular pressure increased

Renal: Acute renal failure (secondary to rhabdomyolysis)

Respiratory: Apnea, respiratory depression (prolonged)

Miscellaneous: Anaphylaxis, malignant hyperthermia

Postmarketing and/or case reports: Acute quadriplegic myopathy syndrome (prolonged use), myositis ossificans (prolonged use)

Causes of prolonged neuromuscular blockade: Excessive drug administration; cumulative drug effect, decreased metabolism/excretion (hepatic and/or renal impairment); accumulation of active metabolites; electrolyte imbalance (hypokalemia, hypocalcemia, hypermagnesemia, hypernatremia); hypothermia; drug interactions; increased sensitivity to muscle relaxants (eg, neuromuscular disorders such as myasthenia gravis or polymyositis)

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the neuromuscular-blocking effect of Succinylcholine. *Risk C: Monitor therapy*

Aminoglycosides: May enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Analgesics (Opioid): Succinylcholine may enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Botulinum Toxin Type A: Neuromuscular-Blocking Agents may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Neuromuscular-Blocking Agents may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Cardiac Glycosides: Neuromuscular-Blocking Agents may enhance the arrhythmogenic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Colistimethate: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Cyclophosphamide: May decrease the metabolism of Succinylcholine. *Risk D: Consider therapy modification*

Echothiophate Iodide: May decrease the metabolism of Succinylcholine. *Risk D: Consider therapy modification*

Lincosamide Antibiotics: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Lithium: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Loop Diuretics: May diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Loop Diuretics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Magnesium Salts: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Phenelzine: May enhance the neuromuscular-blocking effect of Succinylcholine. *Risk D: Consider therapy modification*

Polymyxin B: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Procainamide: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

QuiNIDine: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Tetracycline Derivatives: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Vancomycin: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Monitoring Parameters

Monitor cardiac, blood pressure, and oxygenation during administration; temperature, serum potassium and calcium, assisted ventilator status; neuromuscular function with a peripheral nerve stimulator

Nursing: Physical Assessment/Monitoring

Only clinicians experienced in the use of neuromuscular-blocking drugs should administer and/or manage the use of succinylcholine. Dosage and rate of administration should be individualized and titrated to the desired effect, according to relevant clinical factors, premedication, concomitant medications, age, and general condition of patient. Ventilatory support must be instituted and maintained until adequate respiratory muscle function and/or airway protection are assured. Assess other medications for effectiveness and safety. Other drugs that affect neuromuscular activity may increase/decrease neuromuscular block induced by succinylcholine. This drug does not cause anesthesia or analgesia; pain must be treated with appropriate analgesic agents. Continuous monitoring of vital signs, cardiac status, respiratory status, and degree of neuromuscular block (objective assessment with external nerve stimulator) is mandatory during infusion and until full muscle tone has returned. Muscle tone returns in a predictable pattern, starting with limbs, abdomen, chest diaphragm, intercostals, and finally muscles of the neck, face, and eyes. Safety precautions must be maintained until full muscle tone has returned. Provide appropriate patient teaching/support prior to and following administration.

Monitoring: Lab Tests

Serum potassium and calcium

Patient Education

Patient will usually be unconscious prior to administration. Education should be appropriate to individual situation. Reassurance of constant monitoring and emotional support to reduce fear and anxiety should precede and follow administration. Following return of muscle tone, do not attempt to change position or rise from bed without assistance. Report immediately any skin rash or hives, pounding heartbeat, respiratory difficulty, or muscle tremors. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage Forms

Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as chloride:

Anectine®: 20 mg/mL (10 mL)

Quelicin®: 20 mg/mL (10 mL)

Injection, solution, as chloride [preservative free]:

Quelicin®: 100 mg/mL (10 mL)

Generic AvailableNo

Mechanism of ActionActs similar to acetylcholine, produces depolarization of the motor endplate at the myoneural junction which causes sustained flaccid skeletal muscle paralysis produced by state of accommodation that developes in adjacent excitable muscle membranes

Pharmacodynamics/Kinetics

Onset of action: I.M.: 2-3 minutes; I.V.: Complete muscular relaxation: 30-60 seconds

Duration: I.M.: 10-30 minutes; I.V.: 4-6 minutes with single administration

Metabolism: Rapidly hydrolyzed by plasma pseudocholinesterase

Excretion: Urine

Related Information

- Neuromuscular-Blocking Agents

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMAO inhibitors may prolong the effects of succinylcholine

Anesthesia and Critical Care Concerns/Other ConsiderationsClassified as an ultra-short duration neuromuscular-blocking agent; some formulations may contain benzyl alcohol.

Critically-Ill Adult Patients: The 2002 ACCM/SCCM/ASHP clinical practice guidelines for sustained neuromuscular blockade in the adult critically-ill patient recommend:

Optimize sedatives and analgesics prior to initiation and monitor and adjust accordingly during course. Neuromuscular blockers do not relieve pain or produce sedation.

Protect patient's eyes from development of keratitis and corneal abrasion by administering ophthalmic ointment and taping eyelids closed or using eye patches. Reposition patient routinely to protect pressure points from breakdown. Address DVT prophylaxis.

Concurrent use of a neuromuscular blocker and corticosteroids appear to increase the risk of certain ICU myopathies; avoid or administer the corticosteroid at the lowest dose possible. Reassess need for neuromuscular blocker daily.

Using daily drug holidays (stopping neuromuscular-blocking agent until patient requires it again) may decrease the incidence of acute quadriplegic myopathy syndrome.

Tachyphylaxis can develop; switch to another neuromuscular blocker (taking into consideration the patient's organ function) if paralysis is still necessary.

Atracurium or cisatracurium is recommended for patients with significant hepatic or renal disease, due to organ-independent Hofmann elimination.

Monitor patients clinically and via “Train of Four” (TOF) testing with a goal of adjusting the degree of blockade to 1-2 twitches or based upon the patient's clinical condition.

Index TermsSuccinylcholine Chloride; Suxamethonium Chloride

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Sucralfate may be confused with salsalate

Carafate® may be confused with Cafergot®

Pronunciation(soo KRAL fate)

U.S. Brand NamesCarafate®

Canadian Brand NamesNovo-Sucralate; Nu-Sucralate; PMS-Sucralate; Sulcrate®; Sulcrate® Suspension Plus

Pharmacologic CategoryGastrointestinal Agent, Miscellaneous

Use: Labeled IndicationsShort-term (≤8 weeks) management of duodenal ulcers; maintenance therapy for duodenal ulcers

Use: Unlabeled/InvestigationalGastric ulcers; suspension may be used topically for treatment of stomatitis due to cancer chemotherapy and other causes of esophageal and gastric erosions; GERD, esophagitis; treatment of NSAID mucosal damage; prevention of stress ulcers; postsclerotherapy for esophageal variceal bleeding

Dosing: Adults

Stress ulcer prophylaxis (unlabeled use): Oral: 1 g 4 times/day

Stress ulcer treatment (unlabeled use): Oral: 1 g every 4 hours

Treatment of duodenal ulcer: Oral:

Initial treatment: 1 g 4 times/day, 1 hour before meals or food and at bedtime for 4-8 weeks, or alternatively 2 g twice daily; treatment is recommended for 4-8 weeks in adults

Maintenance/prophylaxis of duodenal ulcer: 1 g twice daily

Stomatitis (unlabeled use): Oral: 10 mL (1 g/10 mL suspension); swish and spit or swish and swallow 4 times/day.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDoses of 40-80 mg/kg/day divided every 6 hours have been used

Stomatitis (unlabeled use): Oral: Children: 5-10 mL (1 g/10 mL suspension), swish and spit or swish and swallow 4 times/day

Dosing: Renal ImpairmentAluminum salt is minimally absorbed (<5%), however, may accumulate in renal failure.

Administration: OralTablet may be broken or dissolved in water before ingestion. Administer with water on an empty stomach.

Dietary ConsiderationsAdminister with water on an empty stomach.

StorageSuspension: Shake well. Store at 20°C to 25°C (68°F to 77°F); do **not** freeze.

ContraindicationsHypersensitivity to sucralfate or any component of the formulation

Warnings/Precautions

Disease-related concerns:

- Duodenal ulceration: Because sucralfate acts locally at the ulcer, successful therapy with sucralfate should not be expected to alter the posthealing frequency of recurrence or the severity of duodenal ulceration.
- Renal impairment: Use with caution in patients with chronic renal failure; sucralfate is an aluminum complex, small amounts of aluminum are absorbed following oral administration. Excretion of aluminum may be decreased in patients with chronic renal failure.

Concurrent drug therapy issues:

- Altered absorption: Because of the potential for sucralfate to alter the absorption of some drugs, separate administration (take other medication 2 hours before sucralfate) should be considered when alterations in bioavailability are believed to be critical.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsCaution should be used in the elderly due to reduced renal function. Patients with Cl_{cr} <30 mL/minute may be at risk for aluminum intoxication. Due to low side effect profile, this may be an agent of choice in the elderly with PUD.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Sucralfate is only minimally absorbed following oral administration.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

1% to 10%: Gastrointestinal: Constipation (2%)

<1%, postmarketing, and/or case reports: Back pain, bezoar formation, diarrhea, dizziness, flatulence, headache, gastric discomfort; hypersensitivity (urticaria, angioedema, facial swelling, laryngospasm, respiratory difficulty, rhinitis); indigestion, insomnia, nausea, pruritus, rash, sleepiness, vertigo, vomiting, xerostomia

Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): Sucralfate may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk C: Monitor therapy*

Eltrombopag: Sucralfate may decrease the serum concentration of Eltrombopag. Management: Separate administration of eltrombopag and any polyvalent cation (e.g., aluminum-containing products such as sucralfate) by at least 4 hours. *Risk D: Consider therapy modification*

Levothyroxine: Sucralfate may decrease the serum concentration of Levothyroxine. *Risk C: Monitor therapy*

Phosphate Supplements: Sucralfate may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Sucralfate may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Sucralfate may interfere with absorption of vitamin A, vitamin D, vitamin E, and vitamin K.

Nursing: Physical Assessment/MonitoringUse caution is presence of renal failure. Assess potential for interactions with other pharmacological agents patient may be taking (eg, will affect absorption of concurrently administered drugs). Assess therapeutic effectiveness (reduction in clinical symptoms) and adverse reactions. Teach patient proper use (eg, timing of other medications), possible side effects (eg, constipation) and interventions, and adverse symptoms to report.

Patient EducationTake recommended dose with water on an empty stomach, 1 hour before or 2 hours after meals. Take any other medications at least 2 hours before taking sucralfate. Do not take antacids (if prescribed) within 30 minutes of taking sucralfate. May cause constipation (increased exercise, fluids, fruit, or fiber may help). If constipation persists, consult prescriber for approved stool softener.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, oral: 1 g/10 mL (10 mL)

Pricing: U.S. (www.drugstore.com)

Suspension (Carafate)

1 g/10 mL (420): $59.01

Tablets (Carafate)

1 g (30): $44.99

Tablets (Sucralfate)

1 g (90): $32.99

Mechanism of ActionForms a complex by binding with positively charged proteins in exudates, forming a viscous paste-like, adhesive substance. This selectively forms a protective coating that acts locally to protect the gastric lining against peptic acid, pepsin, and bile salts.

Pharmacodynamics/Kinetics

Onset of action: Paste formation and ulcer adhesion: 1-2 hours

Duration: Up to 6 hours

Absorption: Oral: <5%

Distribution: Acts locally at ulcer sites; unbound in GI tract to aluminum and sucrose octasulfate

Metabolism: None

Excretion: Urine (small amounts as unchanged compounds)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness, dizziness, or insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsAluminum Sucrose Sulfate, Basic

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

SUFentanil may be confused with alfentanil, fentaNYL

Sufenta® may be confused with Alfenta®, Sudafed®, Survanta®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(soo FEN ta nil)

U.S. Brand NamesSufenta®

Canadian Brand NamesSufentanil Citrate Injection, USP; Sufenta®

Pharmacologic CategoryAnalgesic, Opioid; Anilidopiperidine Opioid; General Anesthetic

Use: Labeled IndicationsAnalgesic supplement in maintenance of balanced general anesthesia; primary anesthetic for induction and maintenance of anesthesia in patients undergoing major surgical procedures; epidural anesthetic in conjunction with bupivacaine in labor and delivery

Dosing: Adults**Note:** Dose should be based on body weight. In obese patients (ie, >20% above ideal body weight), use lean body weight to determine dosage.

Surgical analgesia (surgery duration: 1-2 hours): I.V.: 1-2 mcg/kg with N_2O/O_2; maintenance: 5-20 mcg as needed

Analgesia: Epidural: 10-15 mcg with 10 mL bupivacaine 0.125% with/without epinephrine. May repeat at ≥1-hour interval for 2 additional doses.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Anesthesia: I.V.: Children 2-12 years: Induction: 10-25 mcg/kg (10-15 mcg/kg most common dose) with 100% O_2; maintenance: up to 1-2 mcg/kg total dose

Calculations

- Ideal Body Weight: Adults

Administration: I.V. Detail

pH: 3.5-6

Administration: OtherEpidural: Sufentanil and bupivacaine should be mixed together before administration. Ensure proper needle/catheter placement in epidural space. Administer by slow injection.

CompatibilityStable in D_5W; **variable stability (consult detailed reference)** in NS.

Y-site administration: Compatible: Amphotericin B cholesteryl sulfate complex, atropine, cisatracurium, dexamethasone sodium phosphate, diazepam, diphenhydramine, etomidate, gatifloxacin, haloperidol, hydroxyzine, ketorolac, linezolid, methotrimeprazine, metoclopramide, midazolam, palonosetron, phenobarbital, prochlorperazine edisylate, propofol, remifentanil, scopolamine. **Incompatible:** Lorazepam, phenytoin, thiopental.

Compatibility in syringe: Compatible: Atracurium, atropine, dexamethasone sodium phosphate, diphenhydramine, haloperidol, hydroxyzine, ketorolac, methotrimeprazine, metoclopramide, midazolam, prochlorperazine edisylate, scopolamine. **Incompatible:** Diazepam, lorazepam, phenobarbital, phenytoin.

Compatibility when admixed: Compatible: Bupivacaine.

RestrictionsC-II

ContraindicationsHypersensitivity to sufentanil or any component of the formulation

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Opioid agonist toxicities: Shares the toxic potentials of opiate agonists, and precautions of opiate agonist therapy should be observed.

Disease-related concerns:

- Bradycardia: Use with caution when administering to patients with bradycardia.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Obesity: Use with caution in patients who are morbidly obese. Consider use of lean body weight for dosing in patients >20% over ideal body weight.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

Other warnings/precautions:

- Rapid infusion: Inject slowly over 3-5 minutes; rapid I.V. infusion may result in skeletal muscle and chest wall rigidity, impaired ventilation, or respiratory distress/arrest; nondepolarizing skeletal muscle relaxant may be required.
- Trained individuals: Due to the high incidence of apnea, hypotension, tachycardia and muscle rigidity; it should be administered by individuals specifically trained in the use of anesthetic agents and should not be used in diagnostic or therapeutic procedures outside the monitored anesthesia setting; resuscitative and intubation equipment should be readily available.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.
- Pediatric use: Use caution in neonates as clearance of sufentanil is much slower than adults; neonates with cardiovascular disease have an even slower clearance.

Pregnancy Risk FactorC/D (prolonged use or high doses at term)
Pregnancy Considerations

Animal studies suggest embryocidal effects when given I.V. for a period of 10 days to >30 days. No evidence of teratogenic effects observed in animals. Administration of epidural sufenanil with bupivacaine with or without epinephrine is indicated in labor and delivery. Intravenous use or larger epidural doses are not recommended in pregnant women.

Adverse Reactions

>10%: Dermatologic: Pruritus (epidural: 25%)

1% to 10%:

Cardiovascular: Bradycardia (dose related; 3% to 9%), hyper-/hypotension (3% to 9%; more common with I.V. administration)

Central nervous system: Somnolence (3% to 9%), CNS depression, confusion

Gastrointestinal: Nausea (3% to 9%), vomiting (3% to 9%)

Neuromuscular & skeletal: Chest wall rigidity (dose related; 3% to 9%)

Ocular: Blurred vision

<1%: Anaphylaxis, apnea, arrhythmia, biliary spasm, bronchospasm, cardiac arrest, chills, circulatory depression; cold, clammy skin; dizziness, dysesthesia, erythema, itching, laryngospasm, mental depression, paradoxical CNS excitation or delirium, physical and psychological dependence with prolonged use, respiratory depression (dose related), seizure, skeletal muscle rigidity, skin rash, tachycardia, urinary tract spasm, urinary retention, urticaria

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Beta-Blockers: Anilidopiperidine Opioids may enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): Anilidopiperidine Opioids may enhance the bradycardic effect of Calcium Channel Blockers (Nondihydropyridine). Anilidopiperidine Opioids may enhance the hypotensive effect of Calcium Channel Blockers (Nondihydropyridine). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

MAO Inhibitors: Anilidopiperidine Opioids may enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. Management: Avoid use of fentanyl (and other anilidopiperidine opioids when possible) in patients who have used a monoamine oxidase inhibitor within the past 14 days due to reports of unpredictable but severe adverse effects. *Risk D: Consider therapy modification*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Monitoring ParametersPain relief, respiratory and mental status, blood pressure

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: 50 mcg/mL (1 mL, 2 mL, 5 mL)

Sufenta®: 50 mcg/mL (1 mL, 2 mL, 5 mL)

Generic AvailableYes

Mechanism of ActionBinds to opioid receptors throughout the CNS. Once receptor binding occurs, effects are exerted by opening K+ channels and inhibiting Ca++ channels. These mechanisms increase pain threshold, alter pain perception, inhibit ascending pain pathways; short-acting narcotic; dose-related inhibition of catecholamine release (up to 30 mcg/kg) controls sympathetic response to surgical stress.

Pharmacodynamics/Kinetics

Onset of action: Analgesia: I.V.: 1-3 minutes; epidural: 10 minutes

Duration: Dose dependent; Epidural:10-15 mcg with bupivacaine: 1.7 hours

Protein binding: Neonates: 79%; Adults: 91% to 93%

Metabolism: Primarily hepatic and small intestine

Half-life elimination: Neonates: 5-10 hours; Infants & Children: 55-139 minutes; Adults: 164 minutes

Excretion: Primarily urine as metabolites (2% excreted as unchanged drug)

Related Information

- Narcotic / Opioid Analgesics

Pharmacotherapy PearlsShort-acting narcotic; sufentanil is 5-10 times more potent than fentanyl. Sufentanil is packaged in the same concentration as fentanyl, 50 mcg/mL. Keep in mind the differences in potency to prevent overdose with sufentanil. May choose to dilute sufentanil to decrease concentration; this will decrease the potential for administering excessive doses.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause confusion; may rarely cause delirium or depression

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation

Anesthesia and Critical Care Concerns/Other ConsiderationsSufentanil is a short-acting narcotic, 5-10 times more potent than fentanyl; it is packaged in the same concentration as fentanyl (50 mcg/mL); keep in mind the differences in potency to prevent overdose with sufentanil. Sufentanil may be diluted to decrease concentration; this will decrease the potential for administering excessive doses.

Index TermsSufentanil Citrate

Sulconazole

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(sul KON a zole)
U.S. Brand NamesExelderm®
Canadian Brand NamesExelderm®
Pharmacologic Category[Antifungal Agent, Topical]
Use: Labeled IndicationsTreatment of superficial fungal infections of the skin, including tinea cruris (jock itch), tinea corporis (ringworm), tinea versicolor, and possibly tinea pedis (athlete's foot, cream only)
Dosing: Adults**Tinea infection**: Topical: Apply a small amount to the affected area and gently massage once or twice daily for 3 weeks (tinea cruris, tinea corporis, tinea versicolor) to 4 weeks (tinea pedis).
Dosing: ElderlyRefer to adult dosing.
ContraindicationsHypersensitivity to sulconazole or any component of the formulation
Allergy Considerations

- [Azole Antifungal Allergy]

Warnings/Precautions

Concerns related to adverse effects:

- Irritation: Discontinue if sensitivity or irritation occurs.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: For topical use only; avoid contact with eyes.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse Reactions1% to 10%:

Dermatologic: Itching

Local: Burning, stinging, redness

Metabolism/Transport Effects**Inhibits** CYP1A2 (weak), 2A6 (weak), 2C9 (weak), 2C19 (weak), 2D6 (weak), 2E1 (weak), 3A4 (weak)
Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, as nitrate:

Exelderm®: 1% (15 g, 30 g, 60 g)

Solution, topical, as nitrate:

Exelderm®: 1% (30 mL)

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Cream (Exelderm)

1% (15): $17.59

1% (30): $32.99

1% (60): $52.79

Solution (Exelderm)

1% (30): $37.39

Mechanism of ActionSubstituted imidazole derivative which inhibits metabolic reactions necessary for the synthesis of ergosterol, an essential membrane component. The end result is usually fungistatic; however, sulconazole may act as a fungicide in *Candida albicans* and *Candida parapsilosis* during certain growth phases.
Pharmacodynamics/Kinetics

Absorption: Topical: ~8.7% percutaneously

Excretion: Primarily urine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsSulconazole Nitrate
International Brand NamesExelderm (GB, IE, IT, KP, TW); Genfuxen (TW); Minot (AR); Myk (FR); Myk 1 (BE, LU, NL); Suldisyn (GR); Zynoc (TW)

Sulfabenzamide, Sulfacetamide, and Sulfathiazole

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(sul fa BENZ a mide, sul fa SEE ta mide, & sul fa THYE a zole)

U.S. Brand NamesV.V.S.®

Pharmacologic CategoryAntibiotic, Vaginal

Use: Labeled IndicationsTreatment of *Haemophilus vaginalis* vaginitis

Dosing: Adults***Haemophilus vaginalis* vaginitis:** Intravaginal: Cream: Insert 1 applicatorful in vagina twice daily for 4-6 days. Dosage may then be decreased to $^1/_2$ to $^1/_4$ of an applicatorful twice daily.

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypersensitivity to sulfabenzamide, sulfacetamide, sulfathiazole, or any component of the formulation; renal dysfunction; pregnancy (if near term)

Allergy Considerations

- Sulfonamide Antibiotic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Blood dyscrasias: Severe reactions including agranulocytosis, aplastic anemia and other blood dyscrasias have occurred with sulfonamides (regardless of route).
- Dermatologic reactions: Severe reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have occurred with sulfonamides (regardless of route).
- Hepatic necrosis: Fatalities associated with fulminant hepatic necrosis have occurred with sulfonamides (regardless of route).
- Hypersensitivity reactions: Rarely, systemic hypersensitivity reactions may occur; use caution if applying to denuded or abraded skin.
- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

Pregnancy Risk FactorC (avoid if near term)

LactationExcretion in breast milk unknown

Adverse ReactionsFrequency not defined.

Dermatologic: Pruritus, urticaria, Stevens-Johnson syndrome

Local: Local irritation

Miscellaneous: Allergic reactions

Drug Interactions

Methotrexate: Sulfonamide Derivatives may enhance the adverse/toxic effect of Methotrexate. *Risk D: Consider therapy modification*

Phenytoin: Sulfonamide Derivatives may decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Procaine: May diminish the therapeutic effect of Sulfonamide Derivatives. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Sulfonamide Derivatives may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringSee Contraindications, Warnings/Precautions, and Dosing for use cautions. Assess other medications patient may be taking for effectiveness and interactions (see Warnings/Precautions and Drug Interactions). Teach appropriate administration and adverse symptoms to report (see Patient Education). **Pregnancy risk factor C** - note breast-feeding caution.

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. This medication is only to be inserted into vagina. Use exactly as directed and complete full course of therapy. Follow exact directions for filling applicator with cream. Wash hands before inserting applicator gently into vagina and releasing cream. Wash hands and applicator with soap and water following each application. Discontinue and notify prescriber immediately if burning, irritation, or allergic reaction occurs. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant before use. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, vaginal: Sulfabenzamide 3.7%, sulfacetamide 2.86%, and sulfathiazole 3.42% (78 g with applicator)

Generic Available Yes

Mechanism of Action Interferes with microbial folic acid synthesis and growth via inhibition of para-aminobenzoic acid metabolism

Pharmacodynamics/Kinetics

Absorption: Absorption from vagina is variable and unreliable

Metabolism: Primarily via acetylation

Excretion: Urine

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Index Terms Triple Sulfa

Medication Safety Issues

Sound-alike/look-alike issues:

Blephamide® may be confused with Bleph®-10

Pronunciation(sul fa SEE ta mide & pred NIS oh lone)
U.S. Brand NamesBlephamide®
Canadian Brand NamesBlephamide®; Dioptimyd®
Pharmacologic CategoryAntibiotic/Corticosteroid, Ophthalmic
Use: Labeled IndicationsSteroid-responsive inflammatory ocular conditions in which a corticosteroid is indicated and where infection is present or there is a risk of infection
Dosing: Adults **Conjunctivitis:** Ophthalmic:

Ointment: Apply ~$^{1}/_{2}$ inch ribbon to lower conjunctival sac 3-4 times/day and 1-2 times at night

Solution: Instill 2 drops every 4 hours

Suspension: Instill 2 drops every 4 hours during the day and at bedtime

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric **Conjunctivitis:** Ophthalmic: Children ≥6 years: Refer to adult dosing.
Administration: OtherDo not apply with silver preparations. Discontinue if symptoms do not improve after 2 days. No more than 20 mL or 8 g should be prescribed without proper re-evaluation of the patient.

Suspension: Shake well before use.

Storage

Ointment: Store at 15°C to 25˚C (59°F to 77°F).

Solution, suspension: Do not freeze; protect from light. May darken on prolonged standing or exposure to heat and light. Do not use if darkened; yellowing does not affect activity.

Solution: Store at 15°C to 25˚C (59°F to 77°F).

Suspension: Store at 8°C to 24˚C (46°F to 75°F) in upright position.

ContraindicationsHypersensitivity to sulfacetamide, prednisolone, other sulfonamides or corticosteroids; active viral (including herpes simplex keratitis, vaccinia, varicella) infections of the cornea or conjunctiva, fungal infection of ocular structures, or mycobacterial ocular infections
Allergy Considerations

- Corticosteroid Allergy
- Sulfonamide Antibiotic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Blood dyscrasias: Severe reactions including agranulocytosis, aplastic anemia and other blood dyscrasias have occurred with sulfonamides (regardless of route).
- Dermatologic reactions: Severe reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have occurred with sulfonamides (regardless of route).
- Hepatic necrosis: Fatalities associated with fulminant hepatic necrosis have occurred with sulfonamides (regardless of route).
- Hypersensitivity reactions: Rarely, systemic hypersensitivity reactions may occur.
- Infection: Steroids may mask infection or enhance existing ocular infection; prolonged use may result in secondary infections due to immunosuppression.
- Ocular effects: Prolonged use of steroids may result in glaucoma and injury to the optic nerve. Visual defects in acuity and field of vision may occur. Use with caution in presence of glaucoma (steroids increase intraocular pressure). Perforation may occur with topical steroids in diseases which thin the cornea or sclera. Steroid use may delay healing after cataract surgery. Intraocular pressure should be monitored if this product is used >10 days.

- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

Disease-related concerns:

- Dry eye: Use with caution in patients with severe dry eye

Special populations:

- Contact lens wearers: Products may contain benzalkonium chloride which may be adsorbed by contact lenses; remove contacts prior to administration.

- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

Other warnings/precautions:

- Appropriate use: Re-evaluate if signs and symptoms do not improve after 2 days. Use of >20 mL (solution/suspension) or 8 g (ointment) should only be done following proper re-examination of the patient (eg, slit-lamp biomicroscopy, fluorescein staining).

- P-aminobenzoic acid: May be present in purulent exudates and may reduce the effectiveness of sulfonamides.

- Topical: Not for injection into the eye.

Geriatric ConsiderationsAssess whether patient can adequately instill drops or ointment.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with sulfacetamide. See individual agents.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsSee individual agents.
Adverse ReactionsFrequency not defined. Also refer to individual agents.

Dermatologic: Stevens-Johnson syndrome, toxic epidermal necrolysis, wound healing delayed

Hematologic: Agranulocytosis, aplastic anemia

Hepatic: Hepatic necrosis (fulminant)

Local: Irritation

Ocular: Accommodation loss, anterior uveitis (acute), intraocular pressure elevation, glaucoma, globe perforation, mydriasis, optic nerve damage (infrequent), posterior subcapsular cataract formation, ptosis

Miscellaneous: Allergic reactions, hypercorticoidism (systemic; rare), secondary infections (bacterial, fungal)

Metabolism/Transport EffectsPrednisolone: **Substrate** of CYP3A4 (minor); **Inhibits** CYP3A4 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Methotrexate: Sulfonamide Derivatives may enhance the adverse/toxic effect of Methotrexate. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Phenytoin: Sulfonamide Derivatives may decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Procaine: May diminish the therapeutic effect of Sulfonamide Derivatives. *Risk X: Avoid combination*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Sulfonamide Derivatives may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Monitoring Parameters

Signs and symptoms of improvement after 2 days of therapy; signs and symptoms of secondary infection; intraocular pressure in patients with glaucoma or with prolonged use; periodic exam of lens with prolonged use

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient Education

See individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Ointment, ophthalmic:

Blephamide®: Sulfacetamide sodium 10% and prednisolone acetate 0.2% (3.5 g)

Solution, ophthalmic [drops]: Sulfacetamide sodium 10% and prednisolone sodium phosphate 0.25% (5 mL, 10 mL)

Suspension, ophthalmic [drops]:

Blephamide®: Sulfacetamide sodium 10% and prednisolone acetate 0.2% (5 mL, 10 mL) [contains benzalkonium chloride]

Generic AvailableYes: Solution

Pricing: U.S. (www.drugstore.com)

Ointment (Blephamide S.O.P.)

10-0.2% (3.5): $58.79

Solution (Sulfacetamide-Prednisolone)

10-0.23% (5): $18.99

10-0.23% (10): $24.99

Suspension (Blephamide)

10-0.2% (5): $55.71

10-0.2% (10): $81.37

Mechanism of ActionInterferes with bacterial growth by inhibiting bacterial folic acid synthesis through competitive antagonism of PABA; decreases inflammation by suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability; suppresses the immune system by reducing activity and volume of the lymphatic system

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause dizziness or psychosis

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsPrednisolone and Sulfacetamide

International Brand NamesBlefamide (CO); Blefamide SF (MX); Blefamide SOP (MX); Blephamide (AT, AU, BG, CH, DE, TW); Lonace (PH); Metimyd (MX); Sterilid-V (PH)

Sulfacetamide

Medication Safety Issues

Sound-alike/look-alike issues:

Bleph®-10 may be confused with Blephamide®

Klaron® may be confused with Klor-Con®

Pronunciation(sul fa SEE ta mide)
U.S. Brand NamesBleph®-10; Carmol® Scalp Treatment; Klaron®; Mexar™ [DSC]; Ovace®; Ovace® Plus; Rosula® NS; Seb-Prev™
Canadian Brand NamesCetamide™; Diosulf™
Pharmacologic CategoryAcne Products; Antibiotic, Ophthalmic; Antibiotic, Sulfonamide Derivative; Topical Skin Product, Acne
Use: Labeled Indications

Ophthalmic: Treatment and prophylaxis of conjunctivitis due to susceptible organisms; corneal ulcers; adjunctive treatment with systemic sulfonamides for therapy of trachoma

Dermatologic: Scaling dermatosis (seborrheic); bacterial infections of the skin; acne vulgaris

Dosing: Adults

Conjunctivitis: Ophthalmic:

Ointment: Apply to lower conjunctival sac 1-4 times/day and at bedtime

Solution: Instill 1-2 drops several times daily up to every 2-3 hours in lower conjunctival sac during waking hours and less frequently at night; increase dosing interval as condition responds. Usual duration of treatment: 7-10 days

Trachoma: Instill 2 drops into the conjunctival sac every 2 hours; must be used in conjunction with systemic therapy

Acne: Topical: Apply thin film to affected area twice daily

Seborrheic dermatitis: Topical: Apply at bedtime and allow to remain overnight; in severe cases, may apply twice daily. Duration of therapy is usually 8-10 applications; dosing interval may be increased as eruption subsides. Applications once or twice weekly, or every other week may be used to prevent eruptions.

Secondary cutaneous bacterial infections: Topical: Apply 2-4 times/day until infection clears

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Conjunctivitis: Ophthalmic: Children >2 months: Refer to adult dosing.

Dermatologic: Topical: Children >12 years: Refer to adult dosing.

Administration: Topical

Scalp lotion: Shampoo hair with a nonirritating shampoo prior to application. Part hair in sections and apply small quantities of lotion to scalp; rub in gently. Brush hair for 2-3 minutes. May discolor white fabric.

Acne lotion: Shake well before using.

StorageStore at controlled room temperature.

Ophthalmic solution: Solution may be used if yellow; do not use if darkened.

Carmol® Scalp treatment: Do not freeze. May be used if slightly discolored.

Compatibility**Incompatible** with silver and zinc sulfate.

Incompatible with blood or purulent exudates.

ContraindicationsHypersensitivity to sulfacetamide, sulfonamides, or any component of the formulation
Allergy Considerations

- Sulfonamide Antibiotic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Blood dyscrasias: Severe reactions including agranulocytosis, aplastic anemia and other blood dyscrasias have occurred with sulfonamides (regardless of route).

- Dermatologic reactions: Severe reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have occurred with sulfonamides (regardless of route).

- Hepatic necrosis: Fatalities associated with fulminant hepatic necrosis have occurred with sulfonamides (regardless of route).

- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

Dosage form specific issues:

- Ophthalmic: Inactivated by purulent exudates containing PABA; use with caution in severe dry eye; ointment may retard corneal epithelial healing. For topical application to the eye only; not for injection. Safety and efficacy have not been established in children <2 months of age.

- Topical: Use caution if applied to denuded or abraded skin. Some products contain sodium metabisulfite which may cause allergic reactions in certain individuals. For external use only; avoid contact with eyes. Safety and efficacy have not been established in children <12 years of age.

Geriatric ConsiderationsAssess whether patient can adequately instill drops or ointment.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted and there are no adequate and well-controlled studies in pregnant women. Use of systemic sulfonamides during pregnancy may cause kernicterus in the newborn; the amount of systemic absorption following topical administration is not known. Use during pregnancy only if clearly needed.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsThe amount of systemic absorption following topical administration is not known. When used orally, small amounts of sulfonamides are excreted in breast milk.
Adverse ReactionsFrequency not defined.

Cardiovascular: Edema

Dermatologic: Burning, erythema, irritation, itching, stinging, Stevens-Johnson syndrome

Ocular (following ophthalmic application): Burning, conjunctivitis, conjunctival hyperemia, corneal ulcers, irritation, stinging

Miscellaneous: Allergic reactions, systemic lupus erythematosus

Drug Interactions

Methotrexate: Sulfonamide Derivatives may enhance the adverse/toxic effect of Methotrexate. *Risk D: Consider therapy modification*

Phenytoin: Sulfonamide Derivatives may decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Procaine: May diminish the therapeutic effect of Sulfonamide Derivatives. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Sulfonamide Derivatives may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Monitoring ParametersResponse to therapy
Nursing: Physical Assessment/MonitoringAssess for previous sulfonamide allergy. Assess effectiveness (resolution of infection). Teach patient appropriate use (ophthalmic/topical), interventions to reduce side effects, and adverse symptoms to report.
Patient EducationUse as directed. Complete full course of therapy even if condition appears improved. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Ophthalmic: Do not use other eye preparations at this time without consulting prescriber. Store at room temperature. Shake solution before using. Apply prescribed amount as often as directed. Wash hands before using. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). When using solution, tilt head back and look upward. Gently pull down lower lid and put drop(s) in inner corner of eye. When using ointment, place medicine inside the lower lid, close eye, and roll eyeball in all directions. Do not blink for ${}^{1}/_{2}$ minute. Apply gentle pressure to inner corner of eye for 30 seconds. Wipe away excess from skin around eye. Do not use any other eye preparation for at least 10 minutes. Do not share medication with anyone else. May cause sensitivity to bright light (dark glasses may help); temporary stinging or blurred vision may occur. Inform prescriber if you experience eye pain, redness, burning, watering, dryness, double vision, puffiness around eye, vision changes, or other adverse eye response; worsening of condition or lack of improvement within 3-4 days.

Topical: For external use only. Apply a thin film to affected area as often as directed. Do not cover with occlusive dressing; do not apply other lotions, creams, or medications to the area while using this medication. Report increased skin redness, irritation, or development of open sores; or if condition worsens or does not improve.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] =

Pricing: U.S. (www.drugstore.com)

Cream (Ovace)

10% (60): $109.99

Foam (Ovace)

10% (50): $68.72

10% (100): $130.28

Gel (Ovace)

10% (30): $65.99

Liquid (Ovace Wash)

10% (170): $84.32

10% (360): $154.80

Liquid (Ovace Wash Plus)

10% (180): $102.22

Lotion (Carmol Scalp Treatment)

10-10% (85): $95.35

Lotion (Klaron)

10% (118): $130.79

Lotion (Sulfacetamide Sodium (Acne))

10% (118): $97.00

Pads (Rosula NS)

10-10% (30): $112.19

Solution (Bleph-10)

10% (5): $20.99

Solution (Sulfacetamide Sodium)

10% (15): $12.99

Mechanism of ActionInterferes with bacterial growth by inhibiting bacterial folic acid synthesis through competitive antagonism of PABA

Pharmacodynamics/Kinetics

Half-life elimination: 7-13 hours

Excretion: When absorbed, primarily urine (as unchanged drug)

Related Information

- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsSodium Sulfacetamide; Sulfacetamide Sodium

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

SulfaDIAZINE may be confused with sulfasalazine, sulfiSOXAZOLE

Pronunciation(sul fa DYE a zeen)

Pharmacologic CategoryAntibiotic, Sulfonamide Derivative

Use: Labeled IndicationsTreatment of urinary tract infections and nocardiosis; adjunctive treatment in toxoplasmosis; uncomplicated attack of malaria

Use: Unlabeled/InvestigationalRheumatic fever prophylaxis

Dosing: Adults

Toxoplasmosis: Oral: 2-6 g/day divided every 6 hours in conjunction with pyrimethamine 50-75 mg/day and with supplemental folinic acid

Asymptomatic meningococcal carriers: 1 g twice daily for 2 days

Nocardiosis: 4-8 g/day for a minimum of 6 weeks

Prevention of recurrent attacks of rheumatic fever (unlabeled use): 1 g/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Asymptomatic meningococcal carriers: Oral:

Infants 1-12 months: 500 mg once daily for 2 days

Children 1-12 years: 500 mg twice daily for 2 days

Congenital toxoplasmosis: Oral:

Newborns and Children <2 months: 100 mg/kg/day divided every 6 hours in conjunction with pyrimethamine 1 mg/kg/day once daily and supplemental folinic acid 5 mg every 3 days for 6 months

Children >2 months: 25-50 mg/kg/dose 4 times/day

Toxoplasmosis: Oral:

Children >2 months: Loading dose: 75 mg/kg; maintenance dose: 120-150 mg/kg/day, maximum dose: 6 g/day; divided every 4-6 hours in conjunction with pyrimethamine 2 mg/kg/day divided every 12 hours for 3 days followed by 1 mg/kg/day once daily with supplemental folinic acid

Prevention of recurrent attacks of rheumatic fever (unlabeled use): Oral: >30 kg: 1 g/day; <30 kg: 0.5 g/day

Administration: OralTablets may be crushed to prepare oral suspension of the drug in water or with a sucrose-containing solution. Aqueous suspension with concentrations of 100 mg/mL should be stored in the refrigerator and used within 7 days. Administer around-the-clock to promote less variation in peak and trough serum levels.

Dietary ConsiderationsSupplemental folinic acid should be administered to reverse symptoms or prevent problems due to folic acid deficiency.

StorageTablets may be crushed to prepare oral suspension of the drug in water or with a sucrose-containing solution. Aqueous suspension with concentrations of 100 mg/mL should be stored in the refrigerator and used within 7 days.

ContraindicationsHypersensitivity to any sulfa drug or any component of the formulation; porphyria; children <2 months of age unless indicated for the treatment of congenital toxoplasmosis; sunscreens containing PABA; pregnancy (at term)

Allergy Considerations

- Sulfonamide Antibiotic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Blood dyscrasias: Fatalities associated with severe reactions including agranulocytosis, aplastic anemia and other blood dyscrasias have occurred; discontinue use at first sign of rash.

- Dermatologic reactions: Fatalities associated with severe reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have occurred; discontinue use at first sign of rash.

- Hepatic necrosis: Fatalities associated with hepatic necrosis have occurred; discontinue use at first sign of rash.
- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- G6PD deficiency: Use with caution in patients with G6PD deficiency; hemolysis may occur.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment; dosage modification required.

Other warnings/precautions:

- Appropriate use: Fluid intake should be maintained ≥1500 mL/day or administer sodium bicarbonate to keep urine alkaline; more likely to cause crystalluria because it is less soluble than other sulfonamides.

Pregnancy Risk FactorB/D (at term)
LactationEnters breast milk/contraindicated
Adverse ReactionsFrequency not defined.

Central nervous system: Dizziness, fever, headache

Dermatologic: Lyell's syndrome, Stevens-Johnson syndrome, itching, rash, photosensitivity

Endocrine & metabolic: Thyroid function disturbance

Gastrointestinal: Anorexia, diarrhea, nausea, vomiting

Genitourinary: Crystalluria

Hematologic: Aplastic anemia, granulocytopenia, hemolytic anemia, leukopenia, thrombocytopenia

Hepatic: Hepatitis, jaundice

Renal: Hematuria, acute nephropathy, interstitial nephritis

Miscellaneous: Serum sickness-like reactions

Metabolism/Transport Effects**Substrate** of CYP2C9 (major), 2E1 (minor), 3A4 (minor); **Inhibits** CYP2C9 (strong)
Drug Interactions

CycloSPORINE: Sulfonamide Derivatives may enhance the nephrotoxic effect of CycloSPORINE. Sulfonamide Derivatives may decrease the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Methotrexate: Sulfonamide Derivatives may enhance the adverse/toxic effect of Methotrexate. *Risk D: Consider therapy modification*

Phenytoin: Sulfonamide Derivatives may decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Procaine: May diminish the therapeutic effect of Sulfonamide Derivatives. *Risk X: Avoid combination*

Sulfonylureas: Sulfonamide Derivatives may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Sulfonamide Derivatives may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: Avoid large quantities of vitamin C or acidifying agents (cranberry juice) to prevent crystalluria.

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization).

Nursing: Physical Assessment/MonitoringAssess for allergy history prior to starting therapy (sulfonamides). Assess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, increased or decreased levels/effects of concurrently administered drugs. Evaluate effectiveness (reduced clinical symptoms) and adverse reactions (eg, rash, photosensitivity, gastrointestinal disturbance [nausea, vomiting, anorexia], anemia, jaundice, hematuria). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsPerform culture and sensitivity prior to initiating therapy.

Patient EducationInform prescriber of any allergies you have. Do not take any new medication during therapy without consulting prescriber. Take as directed, at regular intervals around-the-clock. Take on an empty stomach, 1 hour before or 2 hours after meals with full glass of water. Complete full course of therapy even if you are feeling better. Take a missed dose as soon as possible. If almost time for next dose, skip the missed dose and return to your regular schedule. Do not take a double dose. Avoid large quantities of vitamin C. Maintain adequate hydration to prevent kidney damage (2-3 L/day of fluids unless instructed to restrict fluid intake). May cause dizziness or headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known); photosensitivity (use sunblock, wear protective clothing and eyewear, and avoid direct sunlight); nausea, vomiting, or loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report skin rash, persistent nausea, vomiting, or diarrhea; opportunistic infection (sore throat, fever, vaginal itching or discharge, unusual bruising or bleeding, fatigue); blood in urine or change in urinary pattern; persistent headache; abdominal pain; or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 500 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (SulfADIAZINE)

500 mg (30): $46.32

Mechanism of ActionInterferes with bacterial growth by inhibiting bacterial folic acid synthesis through competitive antagonism of PABA

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Distribution: Throughout body tissues and fluids including pleural, peritoneal, synovial, and ocular fluids; throughout total body water; readily diffused into CSF; enters breast milk

Metabolism: Via N-acetylation

Half-life elimination: 10 hours

Time to peak: Within 3-6 hours

Excretion: Urine (43% to 60% as unchanged drug, 15% to 40% as metabolites)

Related Information

- Sulfonamide Derivatives

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(sul fa DOKS een & peer i METH a meen)

U.S. Brand NamesFansidar®

Pharmacologic CategoryAntimalarial Agent

Use: Labeled IndicationsTreatment of *Plasmodium falciparum* malaria in patients in whom chloroquine resistance is suspected; malaria prophylaxis for travelers to areas where chloroquine-resistant malaria is endemic

Dosing: Adults

Treatment of acute malaria attacks: Oral: A single dose of the following number of Fansidar® tablets is used in sequence with quinine or alone: 3 tablets

Malaria prophylaxis: A single dose should be carried for self-treatment in the event of febrile illness when medical attention is not immediately available: Oral: 3 tablets

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Treatment of acute malaria attacks: Oral: A single dose of the following number of Fansidar® tablets is used in sequence with quinine or alone:

2-11 months: $^1/_4$ tablet

1-3 years: $^1/_2$ tablet

4-8 years: 1 tablet

9-14 years: 2 tablets

>14 years: Refer to adult dosing.

Malaria prophylaxis: A single dose should be carried for self-treatment in the event of febrile illness when medical attention is not immediately available: Oral:

2-11 months: $^1/_4$ tablet

1-3 years: $^1/_2$ tablet

4-8 years: 1 tablet

9-14 years: 2 tablets

>14 years: Refer to adult dosing.

StorageProtect from light.

ContraindicationsHypersensitivity to any sulfa drug, pyrimethamine, or any component of the formulation; porphyria, megaloblastic anemia; repeated prophylactic use is contraindicated in patients with renal failure, hepatic failure, or blood dyscrasias; children <2 months of age due to competition with bilirubin for protein binding sites; pregnancy (at term)

Allergy Considerations

- Sulfonamide Antibiotic Allergy

Warnings/Precautions

Boxed warnings:

- Dermatologic reactions: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Blood dyscrasias: Fatalities associated with severe reactions including agranulocytosis, aplastic anemia and other blood dyscrasias have occurred.
- Dermatologic reactions: **[U.S. Boxed Warning]: Fatalities associated with severe reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have occurred; discontinue use at first sign of rash, myelosuppression or active bacterial/fungal infection.**
- Hepatic necrosis: Fatalities associated with hepatic necrosis have occurred.

- Photosensitivity: May cause photosensitivity.
- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

Disease-related concerns:

- Folate deficiency: Use caution in patients with possible folate deficiency (eg, malabsorption syndrome, pregnancy, alcoholism).
- G6PD deficiency: Use with caution in patients with possible G6PD deficiency; hemolysis occurs.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.
- Seizure disorders: Use with caution in patients with a history of seizure disorders.

Concurrent drug therapy issues:

- Chloroquine: Increased adverse reactions are seen in patients also receiving chloroquine.
- Leucovorin: Should be administered to reverse signs and symptoms of folic acid deficiency.

Special populations:

- Pediatrics: Do not give to infants <2 months of age.

Pregnancy Risk FactorC/D (at term)
Adverse ReactionsFrequency not defined.

Cardiovascular: Myocarditis (allergic), pericarditis (allergic), periorbital edema

Central nervous system: Ataxia, hallucinations, headache, polyneuritis, seizure

Dermatologic: Photosensitivity, Stevens-Johnson syndrome, erythema multiforme, toxic epidermal necrolysis, rash

Endocrine & metabolic: Thyroid function dysfunction

Gastrointestinal: Anorexia, atrophic glossitis, gastritis, pancreatitis, vomiting

Genitourinary: Crystalluria

Hematologic: Megaloblastic anemia, leukopenia, thrombocytopenia, pancytopenia

Hepatic: Hepatic necrosis, hepatitis

Neuromuscular & skeletal: Tremors

Renal: BUN increased, interstitial nephritis, renal failure, serum creatinine increased

Respiratory: Respiratory failure, alveolitis (resembling eosinophilic or allergic)

Miscellaneous: Anaphylactoid reaction, drug fever, hypersensitivity, Lupus-like syndrome, periarteritis nodosum

Metabolism/Transport EffectsPyrimethamine: **Inhibits** CYP2C8/9 (moderate), 2D6 (moderate)
Drug Interactions

Antipsychotic Agents (Phenothiazines): Antimalarial Agents may increase the serum concentration of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CycloSPORINE: Sulfonamide Derivatives may enhance the nephrotoxic effect of CycloSPORINE. Sulfonamide Derivatives may decrease the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Methotrexate: Sulfonamide Derivatives may enhance the adverse/toxic effect of Methotrexate. *Risk D: Consider therapy modification*

Methylfolate: May diminish the therapeutic effect of Pyrimethamine. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Phenytoin: Sulfonamide Derivatives may decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Procaine: May diminish the therapeutic effect of Sulfonamide Derivatives. *Risk X: Avoid combination*

Sulfonylureas: Sulfonamide Derivatives may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Sulfonamide Derivatives may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Monitoring ParametersCBC, including platelet counts, and urinalysis should be performed periodically

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Sulfadoxine 500 mg and pyrimethamine 25 mg

Generic AvailableNo

Mechanism of ActionSulfadoxine interferes with bacterial folic acid synthesis and growth via competitive inhibition of para-aminiobenzoic acid; pyrimethamine inhibits microbial dihydrofolate reductase, resulting in inhibition of tetrahydrofolic acid synthesis

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Distribution: Sulfadoxine: Well distributed like other sulfonamides; Pyrimethamine: Widely distributed, mainly in blood cells, kidneys, lungs, liver, and spleen

Metabolism: Pyrimethamine: Hepatic; Sulfadoxine: None

Half-life elimination: Pyrimethamine: 80-95 hours; Sulfadoxine: 5-8 days

Time to peak, serum: 2-8 hours

Excretion: Urine (as unchanged drug and several unidentified metabolites)

Pronunciation(sul fa meth OKS a zole & trye METH oh prim)

U.S. Brand NamesBactrim™; Bactrim™ DS; Septra®; Septra® DS; Sulfatrim®

Canadian Brand NamesApo-Sulfatrim®; Apo-Sulfatrim® DS; Apo-Sulfatrim® Pediatric; Novo-Trimel; Novo-Trimel D.S.; Nu-Cotrimox; Septra® Injection

Pharmacologic CategoryAntibiotic, Miscellaneous; Antibiotic, Sulfonamide Derivative

Use: Labeled Indications

Oral treatment of urinary tract infections due to *E. coli*, *Klebsiella* and *Enterobacter* sp, *M. morganii*, *P. mirabilis* and *P. vulgaris*; acute otitis media in children; acute exacerbations of chronic bronchitis in adults due to susceptible strains of *H. influenzae* or *S. pneumoniae*; treatment and prophylaxis of *Pneumocystis jiroveci* pneumonitis (PCP); traveler's diarrhea due to enterotoxigenic *E. coli*; treatment of enteritis caused by *Shigella flexneri* or *Shigella sonnei*

I.V. treatment or severe or complicated infections when oral therapy is not feasible, for documented PCP, empiric treatment of PCP in immune compromised patients; treatment of documented or suspected shigellosis, typhoid fever, *Nocardia asteroides* infection, or other infections caused by susceptible bacteria

Use: Unlabeled/InvestigationalCholera and *Salmonella*-type infections and nocardiosis; chronic prostatitis; as prophylaxis in neutropenic patients with *P. jiroveci* infections, in leukemia patients, and in patients following renal transplantation, to decrease incidence of PCP; treatment of *Cyclospora* infection, typhoid fever, *Nocardia asteroides* infection; prophylaxis against urinary tract infection

Dosing: AdultsDosage recommendations are based on the trimethoprim component. Double-strength tablets are equivalent to sulfamethoxazole 800 mg and trimethoprim 160 mg.

Urinary tract infection:

Oral: One double-strength tablet every 12 hours for 10-14 days

Duration of therapy: Uncomplicated: 3-5 days; Complicated: 7-10 days

Pyelonephritis: 14 days

Prostatitis: Acute: 2 weeks; Chronic: 2-3 months

I.V.: 8-10 mg TMP/kg/day in divided doses every 6, 8, or 12 hours for up to 14 days with severe infections

Chronic bronchitis (acute): Oral: One double-strength tablet every 12 hours for 10-14 days

Meningitis (bacterial): I.V.: 10-20 mg TMP/kg/day in divided doses every 6-12 hours

Shigellosis:

Oral: One double strength tablet every 12 hours for 5 days

I.V.: 8-10 mg TMP/kg/day in divided doses every 6, 8, or 12 hours for up to 5 days

Travelers' diarrhea: Oral: One double strength tablet every 12 hours for 5 days

Sepsis: I.V.: 20 TMP/kg/day divided every 6 hours

Pneumocystis jiroveci:

Prophylaxis: Oral: 1 double strength tablet daily or 3 times/week

Treatment: Oral, I.V.: 15-20 mg TMP/kg/day in 3-4 divided doses

Cyclospora (unlabeled use): Oral, I.V.: 160 mg TMP twice daily for 7-10 days. **Note:** AIDS patients: Oral: 1 double strength tablet 2-4 times/day for 10 days, then 1 double strength tablet 3 times/week for 10 weeks (Verdier, 2000 and Pape, 1994).

Nocardia (unlabeled use): Oral, I.V.:

Cutaneous infections: 5-10 mg TMP/kg/day in 2-4 divided doses

Severe infections (pulmonary/cerebral): 15 mg TMP/kg/day in 2-4 divided doses for 3-4 weeks, then 10 mg TMP/kg/day in 2-4 divided doses. Treatment duration is controversial; an average of 7 months has been reported.

Note: Therapy for severe infection may be initiated I.V. and converted to oral therapy (frequently converted to approximate dosages of oral solid dosage forms: 2 DS tablets every 8-12 hours). Although not widely available, sulfonamide levels should be considered in patients with questionable absorption, at risk for dose-related toxicity, or those with poor therapeutic response.

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRecommendations are based on the trimethoprim component.

General dosing guidelines: Children >2 months:

Mild-to-moderate infections: Oral: 8-12 mg TMP/kg/day in divided doses every 12 hours

Serious infection:

Oral: 20 mg TMP/kg/day in divided doses every 6 hours

I.V.: 8-12 mg TMP/kg/day in divided doses every 6 hours

Acute otitis media: Oral: 8 mg TMP/kg/day in divided doses every 12 hours for 10 days. **Note:** Recommended by the American Academy of Pediatrics as an alternative agent in penicillin allergic patients at a dose of 6-10mg TMP/kg/day (AOM guidelines, 2004).

Urinary tract infection:

Treatment:

Oral: 6-12 mg TMP/kg/day in divided doses every 12 hours

I.V.: 8-10 mg TMP/kg/day in divided doses every 6, 8, or 12 hours for up to 14 days with serious infections

Prophylaxis: Oral: 2 mg TMP/kg/dose daily or 5 mg TMP/kg/dose twice weekly

Pneumocystis:

Treatment: Oral, I.V.: 15-20 mg TMP/kg/day in divided doses every 6-8 hours

Prophylaxis: Oral, 150 mg TMP/m^2/day in divided doses every 12 hours for 3 days/week; dose should not exceed trimethoprim 320 mg and sulfamethoxazole 1600 mg daily

Alternative prophylaxis dosing schedules include:

150 mg TMP/m^2/day as a single daily dose 3 times/week on consecutive days

or

150 mg TMP/m^2/day in divided doses every 12 hours administered 7 days/week

or

150 mg TMP/m^2/day in divided doses every 12 hours administered 3 times/week on alternate days

Shigellosis:

Oral: 8 mg TMP/kg/day in divided doses every 12 hours for 5 days

I.V.: 8-10 mg TMP/kg/day in divided doses every 6, 8, or 12 hours for up to 5 days

Cyclospora (unlabeled use): Oral, I.V.: 5 mg TMP/kg twice daily for 7-10 days

Dosing: Renal Impairment

Cl_{cr} 15-30 mL/minute: Administer 50% of recommended dose.

Cl_{cr} <15 mL/minute: Not recommended

Calculations

- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Infuse over 60-90 minutes, must dilute well before giving.
Administration: I.V. DetailMay be given less diluted in a central line. Not for I.M. injection. Administer around-the-clock every 6-12 hours.

pH: 10

Administration: OralMay be taken with or without food. Administer with at least 8 ounces of water.

Dietary ConsiderationsShould be taken with 8 oz of water.

Storage

Injection: Store at room temperature; do not refrigerate. Less soluble in more alkaline pH. Protect from light. Solution must be diluted prior to administration. Following dilution, store at room temperature; do not refrigerate. Manufacturer recommended dilutions and stability of parenteral admixture at room temperature (25°C):

5 mL/125 mL D_5W; stable for 6 hours.

5 mL/100 mL D_5W; stable for 4 hours.

5 mL/75 mL D_5W; stable for 2 hours.

Studies have also confirmed limited stability in NS; detailed references should be consulted.

Suspension, tablet: Store at controlled room temperature of 15°C to 25°C (59°F to 77°F). Protect from light.

CompatibilityStable in $D_5{}^1/_2$NS, LR, $^1/_2$NS; **variable stability (consult detailed reference)** in D_5W, NS.

Y-site administration: Compatible: Acyclovir, aldesleukin, allopurinol, amifostine, amphotericin B cholesteryl sulfate complex, atracurium, aztreonam, bivalirudin, cefepime, cyclophosphamide, dexmedetomidine, diltiazem, docetaxel, doxorubicin liposome, enalaprilat, esmolol, etoposide phosphate, fenoldopam, filgrastim, fludarabine, gallium nitrate, gatifloxacin, gemcitabine, granisetron, hydromorphone, labetalol, linezolid, lorazepam, magnesium sulfate, melphalan, meperidine, morphine, nicardipine, pancuronium, pemetrexed, perphenazine, piperacillin/tazobactam, remifentanil, sargramostim, tacrolimus, teniposide, thiotepa, vecuronium, zidovudine. **Incompatible:** Fluconazole, midazolam, vinorelbine. **Variable (consult detailed reference):** Cisatracurium, foscarnet.

Compatibility in syringe: Compatible: Dimenhydramine, heparin. **Incompatible:** Pantoprazole.

Compatibility when admixed: Incompatible: Fluconazole, linezolid, verapamil.

ContraindicationsHypersensitivity to any sulfa drug, trimethoprim, or any component of the formulation; megaloblastic anemia due to folate deficiency; infants <2 months of age; marked hepatic damage or severe renal disease (if patient not monitored); pregnancy (at term); breast-feeding

Allergy Considerations

- Sulfonamide Antibiotic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Blood dyscrasias: Fatalities associated with severe reactions including agranulocytosis, aplastic anemia and other blood dyscrasias have occurred; discontinue use at first sign of rash or signs of serious adverse reactions.
- Dermatologic reactions: Fatalities associated with severe reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have occurred; discontinue use at first sign of rash.
- Hepatic necrosis: Fatalities associated with hepatic necrosis have occurred; discontinue use at first sign of rash or signs of serious adverse reactions.
- Hyperkalemia: May cause hyperkalemia (associated with high doses of trimethoprim).
- Hypoglycemia: May cause hypoglycemia, particularly in malnourished, or patients with renal or hepatic impairment.
- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Asthma/allergies: Use with caution in patients with allergies or asthma.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended. Maintain adequate hydration to prevent crystalluria.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Special populations:

- AIDS patients: Incidence of adverse effects appears to be increased in patients with AIDS.
- Elderly: Use with caution in the elderly; greater risk for more severe adverse reactions.
- G6PD deficiency: Use with caution in patients with G6PD deficiency; hemolysis may occur (dose-related).
- Patients with potential for folate deficiency: Use with caution in patients with potential folate deficiency (malnourished, chronic

anticonvulsant therapy, or elderly).

- Slow acetylators: May be more prone to adverse reactions.

Dosage form specific issues:

- Injection vehicle: May contain benzyl alcohol which has been associated with "gasping syndrome" in neonates and sodium metabisulfite.

Geriatric ConsiderationsElderly patients appear at greater risk for more severe adverse reactions.

Pregnancy Risk FactorC/D (at term - expert analysis)

Pregnancy ConsiderationsDo not use at term to avoid kernicterus in the newborn; use during pregnancy only if risks outweigh the benefits since folic acid metabolism may be affected.

LactationEnters breast milk/contraindicated (AAP rates “compatible with restrictions”)

Breast-Feeding ConsiderationsSulfonamides are excreted in low concentrations in breast milk. Use during breast feeding in infants <2 months of age is contraindicated according to the manufacturer. The AAP considers use during breast-feeding “compatible” in full term neonates; however, breast-feeding is not recommended if the infant is ill, stressed, or premature **or** if the infant has glucose-6-phosphate dehydrogenase deficiency or hyperbilirubinemia.

Adverse ReactionsThe most common adverse reactions include gastrointestinal upset (nausea, vomiting, anorexia) and dermatologic reactions (rash or urticaria). Rare, life-threatening reactions have been associated with co-trimoxazole, including severe dermatologic reactions, blood dyscrasias, and hepatotoxic reactions. Most other reactions listed are rare, however, frequency cannot be accurately estimated.

Cardiovascular: Allergic myocarditis

Central nervous system: Apathy, aseptic meningitis, ataxia, chills, depression, fatigue, fever, hallucinations, headache, insomnia, kernicterus (in neonates), nervousness, peripheral neuritis, seizure, vertigo

Dermatologic: Photosensitivity, pruritus, rash, skin eruptions, urticaria; rare reactions include erythema multiforme, exfoliative dermatitis, Henoch-Schönlein purpura, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Endocrine & metabolic: Hyperkalemia (generally at high dosages), hypoglycemia (rare), hyponatremia

Gastrointestinal: Abdominal pain, anorexia, diarrhea, glottis, nausea, pancreatitis, pseudomembranous colitis, stomatitis, vomiting

Hematologic: Agranulocytosis, aplastic anemia, eosinophilia, hemolysis (with G6PD deficiency), hemolytic anemia, hypoprothrombinemia, leukopenia, megaloblastic anemia, methemoglobinemia, neutropenia, thrombocytopenia

Hepatic: Hepatotoxicity (including hepatitis, cholestasis, and hepatic necrosis), hyperbilirubinemia, transaminases increased

Neuromuscular & skeletal: Arthralgia, myalgia, rhabdomyolysis, weakness

Otic: Tinnitus

Renal: BUN increased, crystalluria, diuresis (rare), interstitial nephritis, nephrotoxicity (in association with cyclosporine), renal failure, serum creatinine increased, toxic nephrosis (with anuria and oliguria)

Respiratory: Cough, dyspnea, pulmonary infiltrates

Miscellaneous: Allergic reaction, anaphylaxis, angioedema, periarteritis nodosa (rare), serum sickness, systemic lupus erythematosus (rare)

Oncology: VesicantNo

Metabolism/Transport Effects

Sulfamethoxazole: **Substrate** of CYP2C9 (major), 3A4 (minor); **Inhibits** CYP2C9 (moderate)

Trimethoprim: **Substrate** (major) of CYP2C9, 3A4; **Inhibits** CYP2C8 (moderate), 2C9 (moderate)

Drug Interactions

ACE Inhibitors: Trimethoprim may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Amantadine: Trimethoprim may enhance the adverse/toxic effect of Amantadine. Specifically, the risk of myoclonus and/or delerium may be increased. Amantadine may increase the serum concentration of Trimethoprim. Trimethoprim may increase the serum concentration of Amantadine. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Trimethoprim may enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Antidiabetic Agents (Thiazolidinedione): Trimethoprim may decrease the metabolism of Antidiabetic Agents (Thiazolidinedione). *Risk C: Monitor therapy*

AzaTHIOprine: Sulfamethoxazole may enhance the myelosuppressive effect of AzaTHIOprine. *Risk C: Monitor therapy*

AzaTHIOprine: Trimethoprim may enhance the myelosuppressive effect of AzaTHIOprine. *Risk C: Monitor therapy*

CycloSPORINE: Sulfonamide Derivatives may enhance the nephrotoxic effect of CycloSPORINE. Sulfonamide Derivatives may decrease the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dapsone: Trimethoprim may increase the serum concentration of Dapsone. Dapsone may increase the serum concentration of Trimethoprim. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dofetilide: Trimethoprim may decrease the excretion of Dofetilide. *Risk X: Avoid combination*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

LamiVUDine: Trimethoprim may decrease the excretion of LamiVUDine. *Risk C: Monitor therapy*

Leucovorin-Levoleucovorin: May diminish the therapeutic effect of Trimethoprim. *Risk D: Consider therapy modification*

Memantine: Trimethoprim may enhance the adverse/toxic effect of Memantine. Specifically, the risk of myoclonus and/or delerium may be increased. Trimethoprim may increase the serum concentration of Memantine. Memantine may increase the serum concentration of Trimethoprim. *Risk C: Monitor therapy*

Methotrexate: Sulfonamide Derivatives may enhance the adverse/toxic effect of Methotrexate. *Risk D: Consider therapy modification*

Methotrexate: Trimethoprim may enhance the adverse/toxic effect of Methotrexate. *Risk D: Consider therapy modification*

Phenytoin: Sulfonamide Derivatives may decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Phenytoin: Trimethoprim may decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Procainamide: Trimethoprim may decrease the excretion of Procainamide. *Risk D: Consider therapy modification*

Procaine: May diminish the therapeutic effect of Sulfonamide Derivatives. *Risk X: Avoid combination*

Repaglinide: Trimethoprim may decrease the metabolism of Repaglinide. *Risk C: Monitor therapy*

Sulfonylureas: Sulfonamide Derivatives may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Sulfonamide Derivatives may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid dong quai; St John's wort (may diminish effects and also cause photosensitization).
Test InteractionsIncreased creatinine (Jaffé alkaline picrate reaction); increased serum methotrexate by dihydrofolate reductase method
Monitoring ParametersPerform culture and sensitivity testing prior to initiating therapy; CBC, serum potassium, creatinine, BUN
Nursing: Physical Assessment/MonitoringSee individual agent for Trimethoprim.
Monitoring: Lab TestsPerform culture and sensitivity testing prior to initiating therapy; CBC, serum potassium, creatinine, BUN
Patient EducationSee individual agent for Trimethoprim.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. **Note:** The 5:1 ratio (SMX:TMP) remains constant in all dosage forms.

Injection, solution: Sulfamethoxazole 80 mg and trimethoprim 16 mg per mL (5 mL, 10 mL, 30 mL)

Suspension, oral: Sulfamethoxazole 200 mg and trimethoprim 40 mg per 5 mL (480 mL)

Sulfatrim®: Sulfamethoxazole 200 mg and trimethoprim 40 mg per 5 mL (100 mL, 480 mL) [contains alcohol ≤0.5% propylene glycol; cherry flavor]

Tablet: Sulfamethoxazole 400 mg and trimethoprim 80 mg

Bactrim™: Sulfamethoxazole 400 mg and trimethoprim 80 mg

Septra®: Sulfamethoxazole 400 mg and trimethoprim 80 mg

Tablet, double strength: Sulfamethoxazole 800 mg and trimethoprim 160 mg

Bactrim™ DS: Sulfamethoxazole 800 mg and trimethoprim 160 mg

Septra® DS: Sulfamethoxazole 800 mg and trimethoprim 160 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Suspension (Sulfamethoxazole-Trimethoprim)

200-40 mg/5 mL (200): $18.98

Suspension (Sulfatrim)

200-40 mg/5 mL (480): $33.98

Tablets (Bactrim)

400-80 mg (30): $37.54

Tablets (Septra DS)

800-160 mg (30): $69.99

Tablets (Sulfamethoxazole-TMP DS)

800-160 mg (30): $19.99

Tablets (Sulfamethoxazole-Trimethoprim)

400-80 mg (30): $15.99

Mechanism of ActionSulfamethoxazole interferes with bacterial folic acid synthesis and growth via inhibition of dihydrofolic acid formation from para-aminobenzoic acid; trimethoprim inhibits dihydrofolic acid reduction to tetrahydrofolate resulting in sequential inhibition of enzymes of the folic acid pathway

Pharmacodynamics/Kinetics

Absorption: Oral: Almost completely, 90% to 100%

Protein binding: SMX: 68%, TMP: 45%

Metabolism: SMX: N-acetylated and glucuronidated; TMP: Metabolized to oxide and hydroxylated metabolites

Half-life elimination: SMX: 9 hours, TMP: 6-17 hours; both are prolonged in renal failure

Time to peak, serum: Within 1-4 hours

Excretion: Both are excreted in urine as metabolites and unchanged drug

Effects of aging on the pharmacokinetics of both agents has been variable; increase in half-life and decreases in clearance have been associated with reduced creatinine clearance

Medication Safety Issues

Sound-alike/look-alike issues:

Sulfasalazine may be confused with salsalate, sulfaDIAZINE, sulfiSOXAZOLE

Azulfidine® may be confused with Augmentin®, azaTHIOprine

Pronunciation(sul fa SAL a zeen)

U.S. Brand NamesAzulfidine®; Azulfidine® EN-tabs®; Sulfazine; Sulfazine EC

Canadian Brand NamesAlti-Sulfasalazine; Salazopyrin En-Tabs®; Salazopyrin®

Pharmacologic Category5-Aminosalicylic Acid Derivative

Use: Labeled IndicationsManagement of ulcerative colitis; enteric coated tablets are also used for rheumatoid arthritis (including juvenile rheumatoid arthritis) in patients who inadequately respond to analgesics and NSAIDs

Use: Unlabeled/InvestigationalAnkylosing spondylitis, collagenous colitis, Crohn's disease, psoriasis, psoriatic arthritis, juvenile chronic arthritis

Dosing: Adults

Ulcerative colitis: Oral: Initial: 1 g 3-4 times/day, 2 g/day maintenance in divided doses; may initiate therapy with 0.5-1 g/day

Rheumatoid arthritis: Oral (enteric coated tablet): Initial: 0.5-1 g/day; increase weekly to maintenance dose of 2 g/day in 2 divided doses; maximum: 3 g/day (if response to 2 g/day is inadequate after 12 weeks of treatment)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Ulcerative colitis: Oral: Children ≥2 years: Initial: 40-60 mg/kg/day in 3-6 divided doses; maintenance dose: 20-30 mg/kg/day in 4 divided doses

Juvenile rheumatoid arthritis: Oral (enteric coated tablet): Children ≥6 years: 30-50 mg/kg/day in 2 divided doses; Initial: Begin with $^1/_4$ to $^1/_3$ of expected maintenance dose; increase weekly; maximum: 2 g/day typically

Dosing: Renal Impairment

Cl_{cr} 10-30 mL/minute: Administer twice daily.

Cl_{cr} <10 mL/minute: Administer once daily.

Dosing: Hepatic ImpairmentAvoid use.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralGI intolerance is common during the first few days of therapy (give with meals).

Dietary ConsiderationsSince sulfasalazine impairs folate absorption, consider providing 1 mg/day folate supplement.

StorageProtect from light.

ContraindicationsHypersensitivity to sulfasalazine, sulfa drugs, salicylates, or any component of the formulation; porphyria; GI or GU obstruction; pregnancy (at term)

Allergy Considerations

- 5-Aminosalicylic Acid Derivative Allergy
- Sulfonamide Antibiotic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: Deaths from irreversible neuromuscular and central nervous system have been reported.
- Fibrosing alveolitis: Deaths from fibrosing alveolitis have been reported.
- Folate deficiency: May cause folate deficiency; consider providing 1 mg/day folate supplement.
- Oligospermia: In males, oligospermia (rare) has been reported.
- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product

labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

Disease-related concerns:

- Allergies/asthma: Use with caution in patients with severe allergies or asthma.
- Blood dyscrasias: Use with caution in patients with blood dyscrasias; deaths from agranulocytosis, aplastic anemia, and other blood dyscrasias have been reported.
- G6PD deficiency: Use with caution in patients with G6PD deficiency.
- Hepatic impairment: Use with caution in patients with impaired hepatic function.
- Renal impairment: Use with caution in patients with renal impairment.
- Urinary obstruction: Use with caution in patients with urinary obstruction.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Geriatric ConsiderationsAdjust dose for renal function.

Pregnancy Risk FactorB/D (at term)

LactationEnters breast milk/use caution (AAP recommends use “with caution”)

Breast-Feeding ConsiderationsSulfonamides are excreted in human breast milk and may cause kernicterus in the newborn. Although sulfapyridine has poor bilirubin-displacing ability, use with caution in women who are breast-feeding. The AAP classifies this agent to be used with caution since adverse effects have been reported in nursing infants.

Adverse Reactions

>10%:

Central nervous system: Headache (33%)

Dermatologic: Photosensitivity

Gastrointestinal: Anorexia, nausea, vomiting, diarrhea (33%), gastric distress

Genitourinary: Reversible oligospermia (33%)

<3%:

Dermatologic: Urticaria/pruritus (<3%)

Hematologic: Hemolytic anemia (<3%), Heinz body anemia (<3%)

<0.1%: Alopecia, anaphylaxis, aplastic anemia, ataxia, convulsions, crystalluria, depression, drowsiness, epidermal necrolysis, exfoliative dermatitis, granulocytopenia, hallucinations, hearing loss, hematuria, hepatitis, insomnia, interstitial nephritis, jaundice, leukopenia, Lyell's syndrome, myelodysplastic syndrome, nephropathy (acute), neutropenic enterocolitis, pancreatitis, peripheral neuropathy, photosensitization, rhabdomyolysis, serum sickness-like reactions, skin discoloration, Stevens-Johnson syndrome, thrombocytopenia, thyroid function disturbance, tinnitus, urine discoloration, vasculitis, vertigo

Additional events reported with sulfonamides and/or 5-ASA derivatives: Cholestatic jaundice, eosinophilia pneumonitis, erythema multiforme, fibrosing alveolitis, hepatic necrosis, Kawasaki-like syndrome, SLE-like syndrome, pericarditis, seizure, transverse myelitis

Drug Interactions

Cardiac Glycosides: 5-ASA Derivatives may decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

Methylfolate: Sulfasalazine may decrease the serum concentration of Methylfolate. *Risk C: Monitor therapy*

Thiopurine Analogs: 5-ASA Derivatives may decrease the metabolism of Thiopurine Analogs. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: 5-ASA Derivatives may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. The primary concern is the potential development of Reye's Syndrome, a condition that has been associated with the use of salicylates in children with varicella infections. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: May impair folate absorption.

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization)

Nursing: Physical Assessment/MonitoringAssess for allergy history prior to starting therapy (sulfa drugs, salicylates). Assess potential for interactions with other pharmacological agents patient may be taking (eg, increased or decreased levels/effects of concurrently administered drugs). Evaluate therapeutic effectiveness (reduced clinical symptoms) and adverse reactions (eg, photosensitivity, gastrointestinal disturbance [nausea, vomiting, anorexia], anemia, jaundice, hematuria). Caution patients with diabetes to monitor glucose levels closely (may cause altered effect of oral hypoglycemic agents). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationInform prescriber of any allergies you have. Do not take any new medication during therapy without consulting prescriber. Take as directed, at regular intervals around-the-clock with food. Do not crush, chew, or dissolve coated tablets. Complete full course of therapy even if you are feeling better. Take a missed dose as soon as possible. If almost time for next dose, skip the missed dose and return

to your regular schedule. Do not take a double dose. Maintain adequate hydration to prevent kidney damage (2-3 L/day of fluids unless instructed to restrict fluid intake). If you have diabetes, monitor glucose levels closely (may cause decreased effect of oral hypoglycemic agents). May cause dizziness or headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known); photosensitivity (use sunblock, wear protective clothing and eyewear, and avoid direct sunlight); or nausea, vomiting, or loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report rash; persistent nausea, vomiting, or diarrhea; opportunistic infection (sore throat, fever, vaginal itching or discharge, unusual bruising or bleeding, fatigue); blood in urine or change in urinary pattern; swelling of face, lips, or tongue, tightness in chest, bad cough, blue skin color, or other persistent adverse effects.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 500 mg

Azulfidine®, Sulfazine: 500 mg

Tablet, delayed release, enteric coated: 500 mg

Azulfidine® EN-tabs®, Sulfazine EC: 500 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablet, EC (Azulfidine EN-tabs)

500 mg (100): $65.99

Tablet, EC (Sulfazine EC)

500 mg (60): $24.99

Tablets (Azulfidine)

500 mg (100): $54.99

Tablets (Sulfasalazine)

500 mg (100): $18.99

Mechanism of ActionActs locally in the colon to decrease the inflammatory response and systemically interferes with secretion by inhibiting prostaglandin synthesis

Pharmacodynamics/Kinetics

Absorption: 10% to 15% as unchanged drug from small intestine

Distribution: Small amounts enter feces and breast milk

Metabolism: Via colonic intestinal flora to sulfapyridine and 5-aminosalicylic acid (5-ASA); following absorption, sulfapyridine undergoes N-acetylation and ring hydroxylation while 5-ASA undergoes N-acetylation

Half-life elimination: 5.7-10 hours

Excretion: Primarily urine (as unchanged drug, components, and acetylated metabolites)

Related Information

- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; sulfonamides reported to cause restlessness, irritability, depression, euphoria, disorientation, panic, hallucinations, and delusions

Mental Health: Effects on Psychiatric TreatmentPhotosensitivity is common; use caution with concurrent psychotropics; may cause leukopenia; caution with clozapine and carbamazepine

Index TermsSalicylazosulfapyridine

SulfiSOXAZOLE

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

SulfiSOXAZOLE may be confused with sulfaDIAZINE, sulfamethoxazole, sulfasalazine

Gantrisin® may be confused with Gastrosed™

Pronunciation(sul fi SOKS a zole)
U.S. Brand NamesGantrisin®
Canadian Brand NamesNovo-Soxazole; Sulfizole®
Pharmacologic Category[Antibiotic, Sulfonamide Derivative]
Use: Labeled IndicationsTreatment of urinary tract infections, otitis media, *Chlamydia*; nocardiosis
Dosing: Adults**Susceptible infections:** Oral: 2-4 g stat, 4-8 g/day in divided doses every 4-6 hours
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricNot for use in patients <2 months of age:

Children >2 months: Oral: Initial: 75 mg/kg, followed by 120-150 mg/kg/day in divided doses every 4-6 hours; not to exceed 6 g/day

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minutes: Administer every 8-12 hours.

Cl_{cr} <10 mL/minute: Administer every 12-24 hours.

Hemodialysis effects: >50% is removed by hemodialysis.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister around-the-clock to promote less variation in peak and trough serum levels.
Dietary ConsiderationsShould be taken with a glass of water on an empty stomach.
StorageProtect from light.
ContraindicationsHypersensitivity to sulfisoxazole, any sulfa drug, or any component of the formulation; porphyria; infants <2 months of age (sulfas compete with bilirubin for protein binding sites); patients with urinary obstruction; sunscreens containing PABA; pregnancy (at term)
Allergy Considerations

- Sulfonamide Antibiotic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Blood dyscrasias: Fatalities associated with severe reactions including agranulocytosis, aplastic anemia and other blood dyscrasias have occurred; discontinue use at first sign of rash.
- Dermatologic reactions: Fatalities associated with severe reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have occurred; discontinue use at first sign of rash.
- Hepatic necrosis: Fatalities associated with hepatic necrosis have occurred; discontinue use at first sign of rash.
- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- G6PD deficiency: Use with caution in patients with G6PD deficiency; hemolysis may occur.
- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment; dosage modification required. Risk of crystalluria should be considered.

Geriatric ConsiderationsSulfisoxazole is an effective anti-infective agent. Most prescribers prefer the combination of sulfamethoxazole and trimethoprim for its dual mechanism of action. Trimethoprim penetrates the prostate. Adjust dose for renal function.
Pregnancy Risk FactorB/D (near term)
LactationEnters breast milk/compatible
Adverse ReactionsFrequency not defined.

Cardiovascular: Vasculitis

Central nervous system: Dizziness, fever, headache

Dermatologic: Itching, Lyell's syndrome, rash, photosensitivity, Stevens-Johnson syndrome

Endocrine & metabolic: Thyroid function disturbance

Gastrointestinal: Anorexia, diarrhea, nausea, vomiting

Genitourinary: Crystalluria, hematuria

Hematologic: Aplastic anemia, granulocytopenia, hemolytic anemia, leukopenia, thrombocytopenia

Hepatic: Hepatitis, jaundice

Renal: Interstitial nephritis

Miscellaneous: Serum sickness-like reactions

Metabolism/Transport Effects**Substrate** of CYP2C9 (major); **Inhibits** CYP2C9 (strong)
Drug Interactions

CycloSPORINE: Sulfonamide Derivatives may enhance the nephrotoxic effect of CycloSPORINE. Sulfonamide Derivatives may decrease the serum concentration of CycloSPORINE. *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Methotrexate: Sulfonamide Derivatives may enhance the adverse/toxic effect of Methotrexate. *Risk D: Consider therapy modification*

Phenytoin: Sulfonamide Derivatives may decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Procaine: May diminish the therapeutic effect of Sulfonamide Derivatives. *Risk X: Avoid combination*

Sulfonylureas: Sulfonamide Derivatives may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Sulfonamide Derivatives may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: Interferes with folate absorption.

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization).

Test InteractionsFalse-positive protein in urine; false-positive urine glucose with Clinitest®
Monitoring ParametersCBC, urinalysis, renal function tests, temperature
Nursing: Physical Assessment/MonitoringAssess for allergy history prior to starting therapy (sulfa drugs). Assess potential for interactions with other pharmacological agents patient may be taking (eg, increased or decreased levels/effects of concurrently administered drugs). Assess effectiveness (reduced clinical symptoms) and adverse reactions (eg, photosensitivity, gastrointestinal disturbance [nausea, vomiting, anorexia], anemia, jaundice, hematuria). Caution patients with diabetes to monitor glucose levels closely (may cause altered response to oral hypoglycemics and may cause false-positive urine glucose with Clinitest®). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsCBC, urinalysis, renal function. Obtain specimen for culture prior to first dose.
Patient EducationTake as directed with a full glass of water, at regular intervals around-the-clock, on an empty stomach (1 hour before or 2 hours after a meal). Complete full course of therapy even if you are feeling better. Take a missed dose as soon as possible. If almost time for next dose, skip the missed dose and return to your regular schedule. Do not take a double dose. Maintain adequate hydration (2-3 L/day of fluids) to prevent kidney damage unless instructed to restrict fluid intake. If you have diabetes, this medication may cause increased effect of oral hypoglycemics - monitor glucose levels closely; may alter Clinitest® response; use of alternative method of glucose monitoring is preferable. May cause dizziness or headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known); photosensitivity (use sunblock, wear protective clothing and eyewear, and avoid direct sunlight); or nausea, vomiting, or loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report persistent nausea, vomiting, or

diarrhea; opportunistic infection (sore throat, fever, vaginal itching or discharge, unusual bruising or bleeding, fatigue); blood in urine or change in urinary pattern; swelling of face, lips, or tongue; tightness in chest; bad cough; or other persistent adverse effects. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, oral [pediatric]

Gantrisin®: 500 mg/5 mL (480 mL) [contains alcohol 0.3%; raspberry flavor]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Suspension (Gantrisin Pediatric)

500 mg/5 mL (200): $28.00

Mechanism of ActionInterferes with bacterial growth by inhibiting bacterial folic acid synthesis through competitive antagonism of PABA

Pharmacodynamics/Kinetics

Absorption: Sulfisoxazole acetyl is hydrolyzed in GI tract to sulfisoxazole which is readily absorbed

Distribution: Crosses placenta; enters breast milk

CSF:blood level ratio: Normal meninges: 50% to 80%; Inflamed meninges: 80+%

Protein binding: 85% to 88%

Metabolism: Hepatic via acetylation and glucuronide conjugation to inactive compounds

Half-life elimination: 4-7 hours; prolonged with renal impairment

Time to peak, serum: 2-3 hours

Excretion: Urine (95%, 40% to 60% as unchanged drug) within 24 hours

Related Information

- Antimicrobial Drugs of Choice
- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; sulfonamides reported to cause restlessness, irritability, depression, euphoria, disorientation, panic, hallucinations, and delusions

Mental Health: Effects on Psychiatric TreatmentPhotosensitivity is common; use caution with concurrent psychotropics; may cause leukopenia; caution with clozapine and carbamazepine

Index TermsSulfisoxazole Acetyl; Sulphafurazole

Sulfonated Phenolics and Sulfuric Acid

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation

(SUL fo NATE ed fe NOL iks in AYE kwee us so LU shun)

U.S. Brand NamesDebacterol®
Pharmacologic CategoryAphthous Ulcer Treatment Agent
Use: DentalTherapeutic cauterization in the treatment of oral mucosal lesions (aphthous stomatitis, gingivitis, moderate to severe periodontitis)
ContraindicationsHypersensitivity to sulfur; for external use only
Warnings/Precautions

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Accidental ingestion: If ingested, do not induce vomiting; immediately dilute with milk or water and get medical help or contact a Poison Control Center.
- Appropriate use: For topical use only. Debacterol® is not intended for the treatment of cold sores and fever blisters. Prolonged use of Debacterol® on normal tissue should be avoided.
- Eye exposure: If eye exposure occurs, immediately remove contact lenses, irrigate eyes for at least 15 minutes with lukewarm water, and contact a physician.

Pregnancy Risk FactorC
Breast-Feeding ConsiderationsUnknown if excreted in breast milk; use with caution
Adverse ReactionsLocal: Irritation upon administration
Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, topical:

Debacterol®: Sulfonated phenolics 50% and sulfuric acid 30% (1.5 mL) [for professional use only]

Swab, topical [for oral mucosa]:

Debacterol®: Sulfonated phenolics 50% and sulfuric acid 30% (0.2 mL) [for professional use only]

Generic AvailableNo
Mechanism of ActionSemiviscous, chemical cautery agent which provides controlled, focal debridement and sterilization of necrotic tissues; relieving pain, sealing damaged tissue, and providing local antiseptic action
Dental Health Professional ConsiderationsPrior to application/treatment, the ulcerated mucosal area should be thoroughly dried using the drying swab. After drying lesion, hold applicator "swab" with the colored ring end up. Bend the colored ring tip gently to the side until it snaps to release liquid inside. Liquid flows down into the white tip applicator. Apply the Debacterol® coated applicator tip to the dried ulcer area for at least 5 seconds, but no more than 10 seconds. Use rolling motion to completely cover the entire ulcer bed and ulcer rim. A "stinging" sensation is experienced immediately upon application. Debacterol® will not harm normal mucosa when used as directed. Thoroughly rinse out the mouth with water and spit out the rinse water. If the ulcer pain returns shortly after rinsing with water, it is an indication that some part of the ulcer was not covered. Repeat application one more time following directions above. One application per ulcer is usually sufficient. If excess irritation occurs during use, a rinse with sodium bicarbonate (baking soda) solution will neutralize the reaction (use 0.5 teaspoon in 120 mL water). It is not recommended that more than one Debacterol® treatment session be performed on an individual ulcer.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Sulfur and Sulfacetamide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(SUL fur & sul fa SEE ta mide)

U.S. Brand NamesAVAR™ [DSC]; AVAR™-e; AVAR™-e Green [DSC]; Clarifoam™ EF; Clenia™; Plexion SCT®; Plexion TS® [DSC]; Plexion®; Prascion®; Prascion® AV [DSC]; Prascion® FC; Prascion® RA; Prascion® TS; Rosac®; Rosanil®; Rosula®; Rosula® Clarifying; Sulfacet-R®; Sulfatol®; Sulfatol®-M; Suphera™

Canadian Brand NamesSulfacet-R®

Pharmacologic CategoryAcne Products; Antibiotic, Sulfonamide Derivative; Antiseborrheic Agent, Topical; Topical Skin Product, Acne

Use: Labeled IndicationsAid in the treatment of acne vulgaris, acne rosacea, and seborrheic dermatitis

Dosing: Adults**Acne vulgaris, acne rosacea, seborrheic dermatitis:** Topical: Apply in a thin film 1-3 times/day. Cleansing products should be used 1-2 times/day.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentUse is contraindicated.

Administration: TopicalAvoid contact with eyes, lips, and mucous membranes.

Cleanser: Apply to wet skin and massage gently into skin working into full lather; rinse thoroughly and pat dry.

StorageStore at room temperature 15°C to 25C°C (59°F to 77°F); do not freeze. Avoid excessive heat.

Sulfacet-R®: Once mixed, use within 4 months.

ReconstitutionSulfacet-R®: Prior to dispensing, mix sulfacetamide into bottle containing sulfur. Shake well or stir with glass rod.

ContraindicationsHypersensitivity to sulfur, sulfonamides, or any component of the formulation; kidney disease

Allergy Considerations

- Sulfonamide Antibiotic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Blood dyscrasias: Severe reactions including agranulocytosis, aplastic anemia and other blood dyscrasias have occurred with sulfonamides (regardless of route).
- Dermatologic reactions: Severe reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have occurred with sulfonamides (regardless of route).
- Hepatic necrosis: Fatalities associated with fulminant hepatic necrosis have occurred with sulfonamides (regardless of route).
- Hypersensitivity reactions: Rarely, systemic hypersensitivity reactions may occur; use caution if applying to denuded or abraded skin.
- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Dosage form specific issues:

- Sodium metabisulfite: Some products may contain sodium metabisulfite.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies with this combination have not been conducted.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not define, but are reported to be rare.

Central nervous system: Drug fever

Dermatologic: Contact dermatitis, dryness, erythema, exfoliative dermatitis, itching, Stevens-Johnson syndrome

Hematologic: Agranulocytosis, hemolytic anemia (acute), purpura hemorrhagica

Hepatic: Jaundice

Local: Irritation

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Aerosol, topical [foam]:

Clarifoam™ EF: Sulfur 5% and sulfacetamide sodium 10% (60 g)

Cleanser, topical:

AVAR™: Sulfur 5% and sulfacetamide sodium 10% (228 g)

Plexion®: Sulfur 5% and sulfacetamide sodium 10% (170 g, 340 g)

Prascion®: Sulfur 5% and sulfacetamide sodium 10% (170 g, 340 g)

Prascion® AV: Sulfur 5% and sulfacetamide sodium 10% (227 g) [DSC]

Rosanil®: Sulfur 5% and sulfacetamide sodium 10% (170 g, 390 g)

Rosula®: Sulfur 5% and sulfacetamide sodium 10% (355 mL) [contains urea 10%]

Cleanser, topoical [emulsion-based]:

Sulfatol®: Sulfur 5% and sulfacetamide sodium 10% (355 mL) [contains urea 10%]

Cream, topical:

AVAR™-e: Sulfur 5% and sulfacetamide sodium 10% (45 g) [contains benzyl alcohol]

AVAR™-e Green: Sulfur 5% and sulfacetamide sodium 10% (45 g) [contains benzyl alcohol; color corrective cream]

Clenia™: Sulfur 5% and sulfacetamide sodium 10% (28 g)

Plexion SCT®: Sulfur 5% and sulfacetamide sodium 10% (120 g) [contains benzyl alcohol]

Prascion® RA: Sulfur 5% and sulfacetamide sodium 10% (45 g) [contains benzyl alcohol and sunscreen]

Rosac®: Sulfur 5% and sulfacetamide sodium 10% (45 g) [contains benzyl alcohol and sunscreen]

Suphera™: Sulfur 5% and sulfacetamide sodium 10% (113 g)

Gel, topical:

AVAR™: Sulfur 5% and sulfacetamide sodium 10% (45 g) [contains benzyl alcohol]

Rosula®: Sulfur 5% and sulfacetamide sodium 10% (45 mL) [contains urea 10% and benzyl alcohol]

Gel, topical [emulsion-based]:

Sulfatol®: Sulfur 5% and sulfacetamide sodium 10% (45 mL) [contains urea 10%]

Lotion, topical: Sulfur 5% and sulfacetamide sodium 10% (25 g, 30 g, 45 g, 60 g)

Sulfacet-R®: Sulfur 5% and sulfacetamide sodium 10% (25 g) [contains sodium metabisulfite; tint formulation]

Sulfatol-M®: Sulfur 5% and sulfacetamide sodium 10% (25 g) [contains sodium metabisulfite; tint formulation]

Sulfatol-M®: Sulfur 5% and sulfacetamide sodium 10% (25 g) [contains sodium metabisulfite; tint-free formulation]

Pad, topical [cleansing cloth]:

Plexion®: Sulfur 5% and sulfacetamide sodium 10% (30s, 60s) [contains aloe vera]

Prascion® FC: Sulfur 5% and sulfacetamide sodium 10% (30s, 60s)

Suspension, topical: Sulfur 5% and sulfacetamide sodium 10% (30 g)

Plexion® TS: Sulfur 5% and sulfacetamide sodium 10% (30 g) [contains benzyl alcohol] [DSC]

Prascion® TS: Sulfur 5% and sulfacetamide sodium 10% (30 g)

Wash, topical: Sulfur 5% and sulfacetamide sodium 10% (170 g, 340 g)

Clenia™: Sulfur 5% and sulfacetamide sodium 10% (170 g, 340 g)

Rosac®: Sulfur 1% and sulfacetamide sodium 10% (170 g)

Wash, topical [emulsion-based]:

Rosula® Clarifying: Sulfur 4% and sulfacetamide sodium 10% (473 mL) [contains urea 10%]

Generic Available Yes: Lotion, wash

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Clinoril® may be confused with Cleocin®, Clozaril®, Oruvail®

Pronunciation(SUL in dak)

U.S. Brand NamesClinoril®

Canadian Brand NamesApo-Sulin®; Novo-Sundac; Nu-Sundac

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsManagement of inflammatory diseases including osteoarthritis, rheumatoid arthritis, acute gouty arthritis, ankylosing spondylitis, acute painful shoulder (bursitis/tendonitis)

Dosing: Adults**Note:** Maximum daily dose: 400 mg

Osteoarthritis, rheumatoid arthritis, ankylosing spondylitis: 150 mg twice daily

Acute painful shoulder (bursitis/tendonitis): 200 mg twice daily; usual treatment: 7-14 days

Acute gouty arthritis: 200 mg twice daily; usual treatment: 7 days

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDose not established

Dosing: Renal ImpairmentNot recommended with advanced renal impairment; if required, decrease dose and monitor closely.

Dosing: Hepatic ImpairmentDose reduction is necessary; discontinue if abnormal liver function tests occur.

Administration: OralShould be administered with food or milk.

Dietary ConsiderationsDrug may cause GI upset, bleeding, ulceration, perforation; take with food or milk to minimize GI upset.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).

Extemporaneously PreparedA suspension of sulindac can be prepared by triturating 1000 mg sulindac (5 x 200 mg tablets) with 50 mg of kelco and 400 mg of Veegum® until a powder mixture is formed; then add 30 mL of sorbitol 35% (prepared from 70% sorbitol) to form a slurry; finally add a sufficient quantity of 35% sorbitol to make a final volume of 100 mL; the final suspension is 10 mg/mL and is stable for 7 days

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity or allergic-type reactions to sulindac, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy
- Sulindac Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below.
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure to NSAIDs, anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Aseptic meningitis: May increase the risk of aseptic meningitis, especially in patients with systemic lupus erythematosus (SLE) and mixed connective tissue disorders.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including**

MI, stroke, and new onset or worsening of pre-existing hypertension. Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin's cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.

- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.

- Pancreatitis: Has been reported; discontinue with suspected pancreatitis.

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur. May require dosage adjustment in hepatic dysfunction; sulfide and sulfone metabolites may accumulate.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis. Use caution in patients with renal lithiasis; sulindac metabolites have been reported as components of renal stones; use hydration in patients with a history of renal stones.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from NSAIDs. As much as 60% of the elderly who develop GI complications can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high-dose situations, but the elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorC/D (3rd trimester)

Pregnancy ConsiderationsAnimal studies have not documented teratogenic effects. However, known effects of NSAIDs suggest the potential for premature ductus arteriosus closure, particularly in late pregnancy.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

1% to 10%:

Cardiovascular: Edema (1% to 3%)

Central nervous system: Dizziness (3% to 9%), headache (3% to 9%), nervousness (1% to 3%)

Dermatologic: Rash (3% to 9%), pruritus (1% to 3%)

Gastrointestinal: GI pain (10%), constipation (3% to 9%), diarrhea (3% to 9%), dyspepsia (3% to 9%), nausea (3% to 9%), abdominal cramps (1% to 3%), anorexia (1% to 3%), flatulence (1% to 3%), vomiting (1% to 3%)

Otic: Tinnitus (1% to 3%)

<1% (Limited to important or life-threatening): Agranulocytosis, ageusia, alopecia, anaphylaxis, angioneurotic edema, aplastic anemia, arrhythmia, aseptic meningitis, bitter taste, blurred vision, bone marrow depression, bronchial spasm, bruising, CHF, cholestasis, colitis, conjunctivitis, crystalluria, depression, dry mucous membranes, dyspnea, dysuria, epistaxis, erythema multiforme, exfoliative dermatitis, fever, gastritis, GI bleeding, GI perforation, glossitis, gynecomastia, hearing decreased, hematuria, hemolytic anemia, hepatitis, hepatic failure, hyperglycemia, hyperkalemia, hypersensitivity reaction, hypersensitivity syndrome (includes chills, diaphoresis, fever, flushing), hypersensitivity vasculitis, hypertension, insomnia, intestinal stricture, interstitial nephritis, jaundice, leukopenia, liver function abnormal, metallic taste, necrotizing fascitis, nephrotic syndrome, neuritis, neutropenia, palpitation, pancreatitis, paresthesia, peptic ulcer, photosensitivity, proteinuria, psychosis, purpura, renal calculi, renal failure, renal impairment, retinal disturbances, seizure,

somnolence, Stevens-Johnson syndrome, stomatitis, syncope, thrombocytopenia, toxic epidermal necrolysis, urine discoloration, vaginal bleeding, vertigo, visual disturbance, weakness

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dimethyl Sulfoxide: May decrease the metabolism of Sulindac. Specifically, the concentrations of the active sulfide metabolite are decreased. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Test InteractionsIncreased chloride (S), increased sodium (S), increased bleeding time

Monitoring ParametersLiver enzymes, BUN, serum creatinine, CBC, blood pressure; signs and symptoms of GI bleeding; ophthalmic exam (if ocular complaints develop during treatment)

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. Assess effectiveness and interactions of other medications patient may be taking. Monitor blood pressure at the beginning of therapy and periodically during use. Assess results of laboratory tests, therapeutic effectiveness according to purpose for therapy, and adverse reactions (eg, GI bleeding, hepatotoxicity, ototoxicity) at beginning of therapy and periodically throughout therapy. Schedule ophthalmic evaluations for patients who are taking NSAIDs for long periods of time. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsLiver enzymes, BUN, serum creatinine, CBC, platelets

Patient EducationTake this medication exactly as directed; do not increase dose without consulting prescriber. Take with food or milk to reduce GI distress. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Do not use alcohol, aspirin or aspirin-containing medication, or any other anti-inflammatory medications without consulting prescriber. Regularly scheduled ophthalmic exams are advised with long-term use of NSAIDs. You may experience dizziness, nervousness, or headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or heartburn (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or constipation (increased exercise, fluids, fruit, or fiber may help). GI bleeding, ulceration, or perforation can occur with or without pain; discontinue medication and contact prescriber if persistent abdominal pain, cramping, or blood in stool occurs. Report breathlessness or respiratory difficulty; chest pain; unusual bruising or bleeding; blood in urine, stool, mouth, or vomitus; unusual fatigue; skin rash or itching; change in urinary pattern; or change in hearing or ringing in ears. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 150 mg, 200 mg

Clinoril®: 200 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Clinoril)

200 mg (60): $84.98

Tablets (Sulindac)

150 mg (60): $18.99

200 mg (100): $33.91

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Absorption: 90%

Protein binding: Sulindac, sulfone, and sulfide metabolites: 93% to 98% primarily to albumin

Distribution: Crosses blood-brain barrier (brain concentrations <4% of plasma concentrations) and placental barriers

Metabolism: Hepatic; prodrug metabolized to sulfide metabolite (active) for therapeutic effects and to sulfone metabolites (inactive); parent and inactive sulfone metabolite undergo extensive enterohepatic recirculation

Half-life elimination: Parent drug: ~8 hours; Active metabolite: ~16 hours

Excretion: Urine (~50%, primarily as inactive metabolites, <1% as active metabolite); feces (~25%, primarily as metabolites)

Related Information

- Nonsteroidal Anti-inflammatory Agents

Dental Health: Effects on Dental TreatmentNSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause nervousness; may rarely cause drowsiness, confusion, insomnia, hallucinations, or depression

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance (evidence suggest that this effect may be less than with other NSAIDs) resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A recent meta-analysis (see References) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be conducted and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 chronic heart failure guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents, including ibuprofen and naproxen, may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin's inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective) if possible. If used occasionally, take after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema; may precipitate renal failure in dehydrated patients.

Sulindac is associated with the highest incidence of upper GI bleeds among NSAIDs. It may be less likely to inhibit renal prostaglandin synthesis and adversely affect renal function than most other NSAIDs. Maximum therapeutic response may not be realized for up to 3 weeks.

Sumatriptan and Naproxen

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Naproxen may be confused with Natacyn®, Nebcin®, neomycin, niacin

SUMAtriptan may be confused with somatropin, zolmitriptan

Treximet™ may be confused with Trexall™

Pronunciation(soo ma TRIP tan & na PROKS en)

U.S. Brand NamesTreximet™

Pharmacologic CategoryAntimigraine Agent; Nonsteroidal Anti-inflammatory Drug (NSAID), Oral; Serotonin 5-HT$_{1B, 1D}$ Receptor Agonist

Use: Labeled IndicationsAcute treatment of migraine with or without aura

Dosing: Adults**Migraine:** Oral: 1 tablet (sumatriptan 85 mg and naproxen 500 mg). If a satisfactory response has not been obtained at 2 hours, a second dose may be administered (maximum: 2 tablets/24 hours). **Note:** The safety of treating an average of >5 migraine headaches in a 30-day period has not been established.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl$_{cr}$ ≥30 mL/minute Dosage adjustment not necessary.

Cl$_{cr}$ <30 mL/minute: Use not recommended.

Dosing: Hepatic ImpairmentMild-to-severe impairment: Use is contraindicated by the manufacturer.

Administration: OralMay be administered with or without food. Swallow tablet whole; tablet should not be divided, crushed, or chewed.

Dietary ConsiderationsMay be taken with or without food. Tablet contains sodium 61.2 mg (2.7 mEq/naproxen sodium 500 mg)

StorageStore at controlled room temperature of 25°C (77°F).

Restrictions

An FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to sumatriptan, naproxen, aspirin, other NSAIDs, or any component of the formulation; patients with a history of ischemic heart disease or signs or symptoms of ischemic heart disease (including Prinzmetal's angina, angina pectoris, myocardial infarction, silent myocardial ischemia); patients with a history of or signs/symptoms of cerebrovascular syndromes (including strokes, transient ischemic attacks); patients with a history of or signs/symptoms of peripheral vascular syndromes (including ischemic bowel disease); patients who have had coronary artery bypass (CABG) surgery; uncontrolled hypertension; use within 24 hours of ergotamine derivatives; use within 24 hours of another 5-HT$_1$ agonist; concurrent administration or within 2 weeks of discontinuing an MAO inhibitor, specifically MAO type A inhibitors; management of hemiplegic or basilar migraine; prophylactic treatment of migraine; hepatic impairment

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: **[U.S. Boxed Warning]: Associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Should not be given to patients with documented CAD, history of CABG (contraindicated), or who have risk factors for CAD (eg, hypertension, hypercholesterolemia, smoker, obesity, diabetes, strong family history of CAD, menopause, male >40 years of age) without adequate cardiac evaluation. Patients with suspected CAD should have cardiovascular evaluation to rule out CAD before considering use; if cardiovascular evaluation “is satisfactory,” first dose should be given in the healthcare provider's office.

Periodic evaluation of cardiovascular status should be done in all patients. Coronary artery vasospasm, transient ischemia, myocardial infarction, ventricular tachycardia/fibrillation, cardiac arrest, and death have been reported with 5-HT_1 agonist administration. Patients who experience sensations of chest pain/pressure/tightness or symptoms suggestive of angina following dosing should be evaluated for coronary artery disease or Prinzmetal's angina before receiving additional doses.

- Cerebrovascular events: Cerebral/subarachnoid hemorrhage and stroke have been reported with 5-HT_1 agonist administration.

- Elevated blood pressure: Significant elevation in blood pressure, including hypertensive crisis, has also been reported on rare occasions in patients with and without a history of hypertension; contraindicated in patients with uncontrolled hypertension.

- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.

- Hepatic impairment: Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; use is contraindicated in patients with existing hepatic impairment. Closely monitor patients with any abnormal LFT; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

- Vasospasm-related events: Peripheral vascular ischemia and colonic ischemia have been reported with 5-HT_1 agonist.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Heart failure/edema: Use with caution in patients with heart failure or fluid retention; edema has occurred in patients receiving NSAIDs.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease (Cl_{cr} <30 mL/minute). Long-term NSAID use may result in renal papillary necrosis.

- Seizure disorders: Use with caution in patients with history of seizure disorder or in patients with a lowered seizure threshold; seizures have been reported in patients receiving sumatriptan.

Concurrent drug therapy issues:

- Serotonin syndrome: Symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia may occur with concomitant proserotonergic drugs (ie, SSRIs/SNRIs or triptans) or agents which reduce sumatriptan's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Only indicated for treatment of acute migraine; if a patient does not respond to the first dose, the diagnosis of migraine should be reconsidered.

Geriatric ConsiderationsSee individual agents.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events were observed in animal studies. There are no well-controlled studies in pregnant women. Women exposed to this combination during pregnant are encouraged to contact the Treximet™ Pregnancy Registry (800-336-2176). Also refer to individual agents.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsSumatriptan and naproxen are excreted in breast milk. Breast-feeding is not recommended. Also refer to individual agents.

Adverse Reactions

>1% to 10%:

Cardiovascular: Chest pain/discomfort (3%), palpitations (>1%)

Central nervous system: Dizziness (4%), somnolence (3%), fatigue (≥1%)

Gastrointestinal: Nausea (3%), dyspepsia (2%), xerostomia (2%), abdominal pain (≥1%)

Neuromuscular & skeletal: Neck, throat, and jaw pain/tightness/pressure (3%), paresthesia (2%), weakness (≥1%), muscle tightness (>1%)

Miscellaneous: Feeling hot (>1%)

≤1%: Abdominal distention, acute coronary syndrome, ambulation difficulties, anemia, anxiety, aphasia, arthralgia, asthma, attention disturbances, back pain, biliary colic, bruising, burning, cardiac flutter, cataract, CHF, colitis, conjunctival hemorrhage, conjunctivitis, constipation, cough, depression, diabetes mellitus, diarrhea, disorientation, diverticulitis, dysgeusia, dysphagia, dyspnea, ear pain, epistaxis, facial edema, facial palsy, fever, flatulence, flushing, gastric ulcer, gastritis, gastroesophageal reflux, goiter, heaviness sensation, hyperhidrosis, hypertension, hypoglycemia, hypothyroidism, infection (various), insomnia, irritability, irritable bowel syndrome, jittery, lethargy, leukopenia, lymphadenopathy, malaise, mental impairment, motion sickness, myalgia, nephrolithiasis, nervousness, oral mucosal blistering, oropharyngeal edema, panic attacks, peripheral coldness, peripheral edema, pleurisy, pruritus, psychomotor impairment, rash, renal insufficiency, right ventricular failure, sedation, systemic lupus erythematosus, tachycardia, temperature intolerance, thirst, tinnitus, tongue edema, tremor, urticaria, ventricular extrasystoles, vertigo, viral myocarditis, visual disturbance, vomiting

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: May enhance the vasoconstricting effect of Serotonin 5-HT1D Receptor Agonists. Serotonin 5-HT1D Receptor Agonists may enhance the vasoconstricting effect of Ergot Derivatives. *Risk X: Avoid combination*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

MAO Inhibitors: May decrease the metabolism of Serotonin 5-HT1D Receptor Agonists. Management: If MAO inhibitor therapy is required, naratriptan, eletriptan or frovatriptan may be a suitable 5-HT1D agonist to employ. *Risk X: Avoid combination*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Test InteractionsNaproxen may interfere with 5-HIAA urinary assays; due to an interaction with m-dinitrobenzene, naproxen should be discontinued 72 hours before adrenal function testing if the Porter-Silber test is used.

Monitoring ParametersOccult blood loss; periodic liver function test, CBC, BUN, serum creatinine; urine output; blood pressure; periodic cardiovascular evaluation (long-term use)

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsOccult blood loss; periodic liver function test, CBC, BUN, serum creatinine

Patient EducationSee individual agents. **Pregnancy/breast-feeding:** Inform prescriber if you are pregnant or intend to become pregnant or breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Treximet™ 85/500: Sumatriptan 85 mg and naproxen sodium 500 mg [contains sodium 61.2 mg/tablet (~2.7 mEq/tablet)]

Generic AvailableNo

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Tablets (Treximet)

85-500 mg (9): $199.98

Mechanism of Action

Sumatriptan: Selective agonist for serotonin (5-HT$_{1B}$, 5-HT$_{1D}$ receptors) in cranial arteries to cause vasoconstriction and reduces sterile inflammation associated with antidromic neuronal transmission correlating with relief of migraine

Naproxen: Reversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentSee individual agents.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness. May rarely cause drowsiness, confusion, insomnia, depression, or hallucinations

Mental Health: Effects on Psychiatric TreatmentContraindicated with other serotonin agonists (SSRIs/SNRIs) and MAO inhibitors. Naproxen may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels. SSRIs may enhance the antiplatelet effects of naproxen.

Index TermsNaproxen and Sumatriptan; Naproxen Sodium and Sumatriptan; Naproxen Sodium and Sumatriptan Succinate; Sumatriptan Succinate and Naproxen; Sumatriptan Succinate and Naproxen Sodium

SUMAtriptan

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

SUMAtriptan may be confused with sitaGLIPtin, somatropin, zolmitriptan

International issues:

Imitrex® may be confused with Nitrex® which is a brand name for isosorbide mononitrate in Italy

Pronunciation(soo ma TRIP tan)

U.S. Brand NamesImitrex®

Canadian Brand NamesApo-Sumatriptan®; CO Sumatriptan; Dom-Sumatriptan; Gen-Sumatriptan; Imitrex®; Imitrex® DF; Imitrex® Nasal Spray; Novo-Sumatriptan; PHL-Sumatriptan; PMS-Sumatriptan; ratio-Sumatriptan; Rhoxal-sumatriptan; Riva-Sumatriptan; Sandoz-Sumatriptan; Sumatryx

Pharmacologic CategoryAntimigraine Agent; Serotonin 5-HT$_{1B, 1D}$ Receptor Agonist

Use: Labeled Indications

Oral, SubQ: Acute treatment of migraine with or without aura

SubQ: Acute treatment of cluster headache episodes

Dosing: Adults

Migraine:

Oral: A single dose of 25 mg, 50 mg, or 100 mg (taken with fluids). If a satisfactory response has not been obtained at 2 hours, a second dose may be administered. Results from clinical trials show that initial doses of 50 mg and 100 mg are more effective than doses of 25 mg, and that 100 mg doses do not provide a greater effect than 50 mg and may have increased incidence of side effects. Although doses of up to 300 mg/day have been studied, the total daily dose should not exceed 200 mg. The safety of treating an average of >4 headaches in a 30-day period have not been established.

Intranasal: Single dose of 5, 10, or 20 mg administered in one nostril; a 10 mg dose may be achieved by administration of a single 5 mg dose in each nostril; if headache returns, the dose may be repeated once after 2 hours, not to exceed a total daily dose of 40 mg. The safety of treating an average of >4 headaches in a 30-day period has not been established.

SubQ: Up to 6 mg; if side effects are dose-limiting, lower doses may be used. A second injection may be administered at least 1 hour after the initial dose, but not more than 2 injections in a 24-hour period.

Cluster headache: Refer to dosing under "Migraine, SubQ"

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentDosage adjustment is not necessary.

Dosing: Hepatic ImpairmentBioavailability of oral sumatriptan is increased with liver disease. If treatment is needed, do not exceed single doses of 50 mg. The nasal spray has not been studied in patients with hepatic impairment, however, because the spray does not undergo first-pass metabolism, levels would not be expected to alter. Use of all dosage forms is contraindicated with severe hepatic impairment.

Administration: I.V.Do **not** administer I.V.; may cause coronary vasospasm.

Administration: OralOral: Should be taken with fluids as soon as symptoms appear.

Administration: OtherAdminister injection formulation subcutaneously. An autoinjection device (STATdose System®) is available for use with the 4 mg and 6 mg cartridges.

StorageStore at 2°C to 20°C (36°F to 86°F). Protect from light.

ContraindicationsHypersensitivity to sumatriptan or any component of the formulation; patients with ischemic heart disease or signs or symptoms of ischemic heart disease (including Prinzmetal's angina, angina pectoris, myocardial infarction, silent myocardial ischemia); cerebrovascular syndromes (including strokes, transient ischemic attacks); peripheral vascular syndromes (including ischemic bowel disease); uncontrolled hypertension; use within 24 hours of ergotamine derivatives; use within 24 hours of another 5-HT$_1$ agonist; concurrent administration or within 2 weeks of discontinuing an MAO inhibitor, specifically MAO type A inhibitors; management of hemiplegic or basilar migraine; prophylactic treatment of migraine; severe hepatic impairment; not for I.V. administration

Allergy Considerations

- Serotonin 5-HT$_{1B,1D}$ Receptor Agonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiac events: Coronary artery vasospasm, transient ischemia, myocardial infarction, ventricular tachycardia/fibrillation, cardiac arrest, and death have been reported with 5-HT$_1$ agonist administration. Patients who experience sensations of chest pain/pressure/tightness or symptoms suggestive of angina following dosing should be evaluated for coronary artery disease or Prinzmetal's angina before receiving additional doses.

- Cerebrovascular events: Cerebral/subarachnoid hemorrhage and stroke have been reported with 5-HT$_1$ agonist administration.

- Elevated blood pressure: Significant elevation in blood pressure, including hypertensive crisis, has also been reported on rare occasions in patients with and without a history of hypertension.

- Vasospasm-related events: Peripheral vascular ischemia and colonic ischemia have been reported with 5-HT$_1$ agonist.

Disease-related concerns:

- Coronary artery disease: Should not be given to patients who have risk factors for CAD (eg, hypertension, hypercholesterolemia, smoker, obesity, diabetes, strong family history of CAD, menopause, male >40 years of age) without adequate cardiac evaluation. Patients with suspected CAD should have cardiovascular evaluation to rule out CAD before considering use; if cardiovascular evaluation "is satisfactory", first dose should be given in the healthcare provider's office. Periodic evaluation of cardiovascular status should be done in all patients.

- Hepatic impairment: Use with caution in patients with hepatic impairment. Drug clearance may be reduced leading to increased plasma concentrations; dosage reduction of the oral product is recommended.

- Seizure disorders: Use with caution in patients with history of seizure disorder or in patients with a lowered seizure threshold.

Concurrent drug therapy issues:

- Serotonin syndrome: Symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia may occur with concomitant proserotonergic drugs (ie, SSRIs/SNRIs or triptans) or agents which reduce sumatriptan's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <18 years of age.

Other warnings/precautions:

- Appropriate use: Only indicated for the treatment of migraine or cluster headache.

Geriatric ConsiderationsUse cautiously in the elderly, particularly since many elderly have cardiovascular disease which would put them at risk for cardiovascular adverse effects. Safety and efficacy in the elderly (>65 years) have not been established. Pharmacokinetic disposition is, however, similar to that in young adults.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies using sumatriptan in pregnant women. Use only if potential benefit to the mother outweighs the potential risk to the fetus. A pregnancy registry has been established to monitor outcomes of women exposed to sumatriptan during pregnancy (800-336-2176). Preliminary data from the registry do not suggest a greater risk of birth defects than the general population and so far a specific pattern of malformations has not been identified. However, sample sizes are small and studies are ongoing. In some (but not all) animal studies, administration was associated with embryolethality, fetal malformations and pup mortality.

LactationEnters breast milk/use caution (AAP rates "compatible")

Breast-Feeding ConsiderationsThe amount of sumatriptan an infant would be exposed to following breast-feeding is considered to be small (although the mean milk-to-plasma ratio is ~4.9, weight adjusted doses estimates suggest breast-fed infants receive 3.5% of a maternal dose). Expressing and discarding the milk for 8-12 hours after a single dose is suggested to reduce the amount present even further. The half-life of sumatriptan in breast milk is 2.22 hours.

Adverse Reactions

Injection:

>10%:

Central nervous system: Dizziness (12%), warm/hot sensation (11%)

Local: Pain at injection site (59%)

Neuromuscular & skeletal: Paresthesia (14%)

1% to 10%:

Cardiovascular: Chest pain/tightness/heaviness/pressure (2% to 3%), hyper-/hypotension (1%)

Central nervous system: Burning (7%), feeling of heaviness (7%), flushing (7%), pressure sensation (7%), feeling of tightness (5%), drowsiness (3%), malaise/fatigue (1%), feeling strange (2%), headache (2%), tight feeling in head (2%), cold sensation (1%), anxiety (1%)

Gastrointestinal: Abdominal discomfort (1%), dysphagia (1%)

Neuromuscular & skeletal: Neck, throat, and jaw pain/tightness/pressure (2% to 5%), mouth/tongue discomfort (5%), weakness (5%), myalgia (2%); muscle cramps (1%), numbness (5%)

Ocular: Vision alterations (1%)

Respiratory: Throat discomfort (3%), nasal disorder/discomfort (2%)

Miscellaneous: Diaphoresis (2%)

Nasal spray:

>10%: Gastrointestinal: Bad taste (13% to 24%), nausea (11% to 13%), vomiting (11% to 13%)

1% to 10%:

Central nervous system: Dizziness (1% to 2%)

Respiratory: Nasal disorder/discomfort (2% to 4%), throat discomfort (1% to 2%)

Tablet:

1% to 10%:

Cardiovascular: Chest pain/tightness/heaviness/pressure (1% to 2%), hyper-/hypotension (1%), palpitation (1%), syncope (1%)

Central nervous system: Burning (1%), dizziness (>1%), drowsiness (>1%), malaise/fatigue (2% to 3%), headache (>1%), nonspecified pain (1% to 2%, placebo 1%), vertigo (<1% to 2%), migraine (>1%), sleepiness (>1%)

Gastrointestinal: Diarrhea (1%), nausea (>1%), vomiting (>1%), hyposalivation (>1%)

Genitourinary: Hematuria (1%)

Hematologic: Hemolytic anemia (1%)

Neuromuscular & skeletal: Neck, throat, and jaw pain/tightness/pressure (2% to 3%), paresthesia (3% to 5%), myalgia (1%), numbness (1%)

Otic: Ear hemorrhage (1%), hearing loss (1%), sensitivity to noise (1%), tinnitus (1%)

Respiratory: Allergic rhinitis (1%), dyspnea (1%), nasal inflammation (1%), nose/throat hemorrhage (1%), sinusitis (1%), upper respiratory inflammation (1%)

Miscellaneous: Hypersensitivity reactions (1%), nonspecified pressure/tightness/heaviness (1% to 3%, placebo 2%); warm/cold sensation (2% to 3%, placebo 2%)

Route unspecified: <1%: Postmarketing and uncontrolled studies (limited to important or life-threatening): Abdominal aortic aneurysm, abdominal discomfort, abnormal menstrual cycle, abnormal/elevated liver function tests, accommodation disorders, acute renal failure, agitation, anaphylactoid reaction, anaphylaxis, anemia, angioneurotic edema, arrhythmia, atrial fibrillation, bronchospasm, cerebral ischemia, cerebrovascular accident, convulsions, deafness, death, decreased appetite, dental pain, diarrhea, dyspeptic symptoms, dysphagia, dystonic reaction, ECG changes, fluid disturbances (including retention), flushing, gastrointestinal pain, hallucinations, heart block, hematuria, hemolytic anemia, hiccups, hypersensitivity reactions, intestinal obstruction, intracranial pressure increased, ischemic colitis, joint ache, muscle stiffness, nose/throat hemorrhage, numbness of tongue, optic neuropathy (ischemic), pancytopenia, paresthesia, phlebitis, photosensitivity, Prinzmetal's angina, pruritus, psychomotor disorders, pulmonary embolism, rash, Raynaud syndrome, sensation changes, shock, subarachnoid hemorrhage, swallowing disorders, syncope, thrombocytopenia, thrombophlebitis, thrombosis, transient myocardial ischemia, TSH increased, vasculitis, vision loss, xerostomia

Drug Interactions

Ergot Derivatives: May enhance the vasoconstricting effect of Serotonin 5-HT1D Receptor Agonists. Serotonin 5-HT1D Receptor Agonists may enhance the vasoconstricting effect of Ergot Derivatives. *Risk X: Avoid combination*

MAO Inhibitors: May decrease the metabolism of Serotonin 5-HT1D Receptor Agonists. Management: If MAO inhibitor therapy is required, naratriptan, eletriptan or frovatriptan may be a suitable 5-HT1D agonist to employ. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Nursing: Physical Assessment/MonitoringFor use only with a clear diagnosis of migraine or cluster headaches. Use caution with CAD or history of seizure disorder. Assess potential for interactions with other pharmacological agents patient may be taking (eg, ergot-containing drugs, MAO inhibitors, SSRIs). See Administration for specifics of SubQ, intranasal, oral formulation use. Assess therapeutic effectiveness (relief of headaches) and adverse response (eg, dizziness, tingling, drowsiness, myalgia, vision alternation, nausea, vomiting; reactions differ according to formulation). Teach patient proper use according to formulation (eg, with SubQ, appropriate injection technique and syringe/needle disposal), possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationTake at first sign of migraine attack. This drug is to be used to reduce your migraine, not to prevent or reduce the number of attacks. Follow exact instructions for use.

Nasal spray: Administer dose into one nostril. If headache returns or is not fully resolved after the first dose, the dose may be repeated after 2 hours. **Do not exceed 40 mg in 24 hours.**

Oral: If headache returns or is not fully resolved after first dose, the dose may be repeated after 2 hours. **Do not exceed 200 mg in 24 hours.** Take whole with fluids.

SubQ: If headache returns or is not fully resolved after first dose, the dose may be repeated after 1 hour. **Do not exceed two injections in 24 hours.**

All forms: Do not take any form of this drug within 24 hours of any other migraine medication without consulting prescriber. May cause dizziness, fatigue, or drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known); or nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking on lozenges may help). Report chest tightness or pain; excessive drowsiness; acute abdominal pain; skin rash or burning sensation; muscle weakness, soreness, or numbness; respiratory difficulty; or any other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. **Note:** Strength expressed as sumatriptan base

Injection, solution, as succinate: 8 mg/mL (0.5 mL); 12 mg/mL (0.5 mL)

Imitrex®: 8 mg/mL (0.5 mL); 12 mg/mL (0.5 mL)

Solution, intranasal [spray]: 5 mg/0.1 mL (6s); 20 mg/0.1 mL (6s)

Imitrex®: 5 mg/0.1 mL (6s); 20 mg/0.1 mL (6s)

Tablet, as succinate: 25 mg, 50 mg, 100 mg

Imitrex®: 25 mg, 50 mg, 100 mg

Generic AvailableYes

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Kit (Imitrex STATdose Refill)

6 mg/0.5 mL (1): $196.98

Kit (Imitrex STATdose System)

6 mg/0.5 mL (1): $196.97

Solution (Imitrex)

5 mg/ACT (1): $50.33

6 mg/0.5 mL (2.5): $448.66

20 mg/ACT (6): $236.38

Tablets (Imitrex)

25 mg (9): $247.31

50 mg (9): $229.78

100 mg (9): $215.98

Mechanism of ActionSelective agonist for serotonin (5-HT$_{1D}$ receptor) in cranial arteries to cause vasoconstriction and reduces sterile inflammation associated with antidromic neuronal transmission correlating with relief of migraine

Pharmacodynamics/Kinetics

Onset of action: ~30 minutes

Distribution: V$_d$: 2.4 L/kg

Protein binding: 14% to 21%

Metabolism: Hepatic, primarily via MAO-A isoenzyme

Bioavailability: SubQ: 97% ± 16% of that following I.V. injection; Oral: 15%

Half-life elimination: Injection, tablet: 2.5 hours; Nasal spray: 2 hours

Time to peak, serum: 5-20 minutes

Excretion:

Injection: Urine (38% as indole acetic acid metabolite, 22% as unchanged drug)

Nasal spray: Urine (42% as indole acetic acid metabolite, 3% as unchanged drug)

Tablet: Urine (60% as indole acetic acid metabolite, 3% as unchanged drug); feces (40%)

Related Information

- Antimigraine Drugs: 5-HT1 Receptor Agonists

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Bad taste, dysphagia, hyposalivation (tablet), mouth/tongue discomfort (injection).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause drowsiness

Mental Health: Effects on Psychiatric TreatmentContraindicated with other serotonin agonists (SSRIs) and MAO inhibitors

Cardiovascular ConsiderationsCoronary vasospasm has been associated with 5-HT$_{1B/1D}$ agonists. These agents are contraindicated in patients with documented ischemic of vasospastic coronary artery disease. Patients with risk factors for CAD may receive these agents, provided a cardiovascular evaluation yields satisfactory evidence that the patient is free of cardiovascular disease. In patients with risk factors for CAD, administration of the initial dose in a medically staffed/equipped facility (ie, physician's office) is recommended. In addition, ECG monitoring after the initial dose should be considered. Patients who acquire risk factors for CAD, or long-term users of agents from this class of medications, should undergo periodic cardiovascular evaluation.

Anesthesia and Critical Care Concerns/Other ConsiderationsSumatriptan should not be used in patients with a history of vasospastic disease, Prinzmetal's angina, or any critical vascular disease.

Index TermsSumatriptan Succinate

Sunitinib: Reports of Microangiopathic Hemolytic Anemia (MAHA) in Association With Concomitant Bevacizumab Therapy - July 2008

Genentech Inc (in conjunction with the U.S. Food and Drug Administration [FDA]) and Hoffmann-La Roche Limited (in conjunction with Health Canada) have issued warnings to their respective healthcare professionals regarding the risk for MAHA in association with the concomitant use of bevacizumab (Avastin®) and sunitinib (Sutent®). Upcoming changes to the Canadian labeling for bevacizumab are based on observations made in 2 recent investigational U.S. studies involving combination therapy with a fixed dose of bevacizumab (10 mg/kg every 2 weeks) and variable doses of sunitinib (25 mg, 37.5 mg, or 50 mg/day) in patients with metastatic renal cell carcinoma (mRCC).

Although not reported in patients receiving bevacizumab with sunitinib at lower doses, laboratory findings (schistocytes on microscopy, LDH increased, serum haptoglobin decreased) consistent with MAHA were observed in 37% (n=19) of patients receiving bevacizumab and sunitinib 50 mg/day. Symptoms of MAHA include darkened urine, jaundice, confusion, fever, and splenomegaly or hepatomegaly. Grades 3 or 4 hypertension and reversible posterior leukoencephalopathy syndrome (RPLS), were observed in some patients who developed MAHA. Resolution of these adverse findings was observed within 3 weeks of discontinuing both bevacizumab and sunitinib. In the U.S. and in Canada bevacizumab is **not** approved for use in combination with sunitinib or in the treatment of mRCC.

Further information may be found at:

U.S.: http://www.fda.gov/medwatch/safety/2008/safety08.htm#Avastin

Medication Safety Issues

Sound-alike/look-alike issues:

Sunitinib may be confused with sorafenib

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(su NIT e nib)

U.S. Brand NamesSutent®

Canadian Brand NamesSutent®

Pharmacologic CategoryAntineoplastic Agent, Tyrosine Kinase Inhibitor; Vascular Endothelial Growth Factor (VEGF) Inhibitor

Use: Labeled IndicationsTreatment of gastrointestinal stromal tumor (GIST) intolerance to or disease progression on imatinib; treatment of advanced renal cell cancer (RCC)

Dosing: Adults**Gastrointestinal stromal tumor, renal cell cancer:** Oral: 50 mg once daily for 4 weeks of a 6-week treatment cycle (4 weeks on, 2 weeks off). **Note:** Dosage modifications should be done in increments of 12.5 mg; individualize based on safety and tolerability.

Dosage adjustment with concurrent CYP3A4 inhibitor: Dose reductions are more likely to be needed when sunitinib is administered concomitantly with strong CYP3A4 inhibitors (eg, clarithromycin, erythromycin, itraconazole, ketoconazole, nefazodone, protease inhibitors, telithromycin, voriconazole); dose reductions to a minimum of 37.5 mg/day should be considered with strong CYP3A4 inhibitors.

Dosage adjustment with concurrent CYP3A4 inducer: May require increased doses; dosage increases to a maximum of 87.5 mg/day with careful monitoring should be considered with strong CYP3A4 inducers (eg, carbamazepine, dexamethasone, phenobarbital, phenytoin, rifampin, St. John's wort).

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNot studied in patients with serum creatinine >2 x ULN; pharmacokinetics were unaltered in patients with Cl_{cr} ≥42 mL/minute.

Dosing: Hepatic ImpairmentNo adjustment is necessary with mild-to-moderate (Child-Pugh Class A or B) hepatic impairment; not studied in patients with severe (Child-Pugh Class C) hepatic impairment. Studies excluded patients with ALT/AST >2.5 x ULN, or if due to liver metastases, ALT/AST >5 x ULN.

Dosing: Adjustment for Toxicity

Cardiac toxicity:

Ejection fraction <50% and >20% below baseline without evidence of CHF: Interrupt treatment and/or reduce dose

LV dysfunction with CHF clinical manifestations: Discontinue treatment

Severe hypertension: Temporarily interrupt treatment until hypertension is controlled

Hepatic failure, nephrotic syndrome, or pancreatitis: Discontinue treatment

RPLS or thrombotic microangiopathy: Temporarily withhold treatment; after resolution, may resume with discretion.

Administration: OralMay be taken with or without food.
Dietary ConsiderationsMay be taken with or without food. Avoid grapefruit juice.
StorageStore at room temperature of 25°C (77°F); excursions permitted to 15°C and 30°C (59°F and 86°F).
Extemporaneously Prepared

Sunitinib 10 mg/mL oral suspension: In a mortar, mix the contents of three 50-mg sunitinib capsules with a 1:1 mixture of Ora-Sweet® and Ora-Plus® to a final volume of 15 mL, yielding a final sunitinib concentration of 10 mg/mL; transfer to amber plastic bottle. This suspension maintains an average concentration of 96% to 106% (of the original concentration) at room temperature or refrigerated for up to 60 days in plastic amber prescription bottles. Note: Shake well before use.

Navid F, Christensen R, Minkin P, et al, “Stability of Sunitinib in Oral Suspension,” *Ann Pharmacother*, 2008, 42(7):962-6.

ContraindicationsThere are no contraindications listed within the FDA-approved manufacturer’s labeling.

Canadian labeling: Hypersensitivity to sunitinib or any component of the formulation; pregnancy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal toxicity: Has been reported; monitor for adrenal insufficiency for patients with trauma, severe infection, or undergoing surgery.
- Bleeding: Hemorrhagic events have been reported including epistaxis, rectal, gingival, upper GI, genital, wound bleeding, tumor-related, and hemoptysis/pulmonary hemorrhage.
- Depigmentation: May cause skin and/or hair depigmentation or discoloration.
- Gastrointestinal complications: Serious and fatal gastrointestinal complications, including gastrointestinal perforation, have occurred (rarely).
- Hypertension: May cause hypertension; monitor and control with antihypertensives if needed; interrupt therapy until hypertension is controlled for severe hypertension. Use caution and closely monitor in patients with underlying or poorly-controlled hypertension.
- Left ventricular dysfunction/heart failure: May cause a decrease in left ventricular ejection fraction (LVEF), including grade 3 reductions; monitor with baseline and periodic LVEF evaluations. Mean onset of symptomatic HF is 22 days from treatment initiation. Interrupt therapy and/or decrease dose with LVEF <50% or >20% reduction from baseline. Discontinue with clinical signs and symptoms of heart failure (HF). Use caution with cardiac dysfunction; patients with MI, bypass grafts, HF, vascular diseases (including CVA and TIA), and PE were excluded from clinical trials.
- QT_c prolongation: QT_c prolongation and torsade de pointes have been observed; use caution in patients with a history of QT_c prolongation, with medications known to increase sunitinib levels or prolong the QT interval, or patients with pre-existing (relevant) cardiac disease, bradycardia, or electrolyte imbalance. A baseline and periodic 12-lead ECG should be obtained; correct electrolyte abnormalities prior to treatment and monitor and correct potassium, calcium, and magnesium levels during therapy.
- Reversible posterior leukoencephalopathy syndrome (RPLS): Has been reported (rarely). Symptoms of RPLS include confusion, headache, hypertension, lethargy, seizure, blindness and/or other vision, or neurologic disturbances; interrupt treatment and begin management of hypertension.
- Thyroid disorders: Hypothyroidism may occur; the risk for hypothyroidism appears to increase with therapy duration. Hyperthyroidism, sometimes followed by hypothyroidism, has also been reported. Monitor thyroid function at baseline and if symptomatic

Disease-related concerns:

- Hepatic impairment: Has not been studied in patients with severe hepatic impairment (Child-Pugh class C); patients with ALT or AST >2.5 times ULN (or >5 times ULN if due to liver metastases) were excluded from clinical trials.

Concurrent drug therapy issues:

- Bevacizumab: Microangiopathic hemolytic anemia (MAHA) has been reported when sunitinib has been used in combination with bevacizumab.
- CYP3A4 inhibitors/inducers: Use with caution in patients concurrently taking strong CYP3A4 inhibitors (may increase sunitinib levels; eg, clarithromycin, erythromycin, itraconazole, ketoconazole, nefazodone, protease inhibitors, telithromycin, voriconazole) or inducers (may decrease sunitinib levels; eg, carbamazepine, dexamethasone, phenobarbital, phenytoin, rifampin, St. John’s wort); dosage adjustments of sunitinib may be required.
- QT_c-prolonging agents: Concurrent use with other drugs which may prolong QT_c interval may increase the risk of potentially-fatal arrhythmias.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric Considerations Of the 450 patients studied, 115 (25.6%) were ≥65 years of age. No overall differences in safety or effectiveness were noted between younger adults and geriatric patients. Note, however, warning of left ventricular changes in ejection fraction as many elderly have systolic failure.

Pregnancy Risk Factor D

Pregnancy Considerations Animal studies have demonstrated teratogenicity and fetal loss. There are no adequate and well-controlled studies in pregnant women. Because sunitinib inhibits angiogenesis, a critical component of fetal development, adverse effects on pregnancy would be expected. Women of childbearing potential should be advised to avoid pregnancy.

Lactation Excretion in breast milk unknown/not recommended

Breast-Feeding Considerations Due to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

>10%:

Cardiovascular: Hypertension (15% to 30%; grades 3/4: 4% to 10%), LVEF decreased (11% to 21%; grades 3/4: 1%), heart failure (≤15%), peripheral edema (11%)

Central nervous system: Fatigue (42% to 58%), fever (17% to 18%), headache (13% to 18%), chills (11%), insomnia (11%)

Dermatologic: Hyperpigmentation (19% to 33%), skin discoloration (19% to 30%), rash (14% to 27%), hand-foot syndrome (12% to 21%), dry skin (17% to 18%), hair color changes (7% to 16%)

Endocrine & metabolic: Hyperuricemia (15% to 41%), hypophosphatemia (9% to 36%), hypocalcemia (35%), hypoglycemia (19%), hypoalbuminemia (18%), hyperglycemia (15%), hyponatremia (6% to 14%), hypokalemia (12%), hyperkalemia (6% to 11%), hypernatremia (10% to 11%)

Gastrointestinal: Diarrhea (40% to 58%), lipase increased (25% to 52%), nausea (31% to 49%), taste perversion (21% to 44%), mucositis/stomatitis (29% to 43%), anorexia (31% to 38%), constipation (16% to 34%), abdominal pain (22% to 33%), dyspepsia (28%), vomiting (24% to 28%), amylase increased (5% to 17%), weight loss (12%), xerostomia (12%), GERD/reflux (11%)

Hematologic: Leukopenia (up to 78%; grades 3/4: 5%), neutropenia (53% to 72%; grades 3/4: 10% to 12%), anemia (26% to 72%; grades 3/4: 3% to 7%), thrombocytopenia (38% to 65%; grades 3/4: 5% to 8%), lymphopenia (38% to 59%; grades 3/4: up to 59%), hemorrhage/bleeding (18% to 30%)

Hepatic: AST increased (39% to 52%), ALT increased (39% to 46%), alkaline phosphatase increased (24% to 42%), hyperbilirubinemia (10% to 19%)

Neuromuscular & skeletal: Creatine kinase increased (41%), weakness (21% to 22%), back pain (11% to 19%), arthralgia (12% to 18%), limb pain (14% to 17%), myalgia (14%)

Renal: Creatinine increased (12% to 66%)

Respiratory: Dyspnea (10% to 28%), cough (8% to 17%)

1% to 10%:

Cardiovascular: Venous thrombotic events (2% to 3%), DVT (1% to 3%), myocardial ischemia (1%)

Central nervous system: Depression (8%), dizziness (7%)

Dermatologic: Skin blistering (7%), alopecia (5%)

Endocrine & metabolic: Dehydration (8%), hypothyroidism (3% to 7%)

Gastrointestinal: Flatulence (10%), glossodynia (10%), oral pain (6% to 10%), appetite disturbance (9%), pancreatitis (1%)

Neuromuscular & skeletal: Peripheral neuropathy (10%)

Ocular: Periorbital edema (7%), lacrimation increased (6%)

Respiratory: Pulmonary embolism (1%)

<1%, postmarketing, and/or case reports: Acute renal failure, adrenal dysfunction, atrial flutter, febrile neutropenia, gastrointestinal perforation, hepatic failure, hyperthyroidism, infection, microangiopathic hemolytic anemia (when used in combination with bevacizumab), MI, myopathy, nephrotic syndrome, neutropenic infection, preeclampsia-like syndrome (proteinuria and reversible hypertension), proteinuria, pulmonary hemorrhage, QT_c prolongation, reversible posterior leukoencephalopathy syndrome (RPLS), rhabdomyolysis, seizure, thrombotic microangiopathy, torsade de pointes, ventricular arrhythmia

Oncology: Emetic Potential Low (10% to 30%)

Metabolism/Transport Effects **Substrate** of CYP3A4 (major)

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Sunitinib. *Risk D: Consider therapy modification*

Bevacizumab: Sunitinib may enhance the adverse/toxic effect of Bevacizumab. Specifically, the risk of a specific form of anemia, microangiopathic hemolytic anemia (MAHA), may be increased. *Risk X: Avoid combination*

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Sunitinib. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Grapefruit juice may increase the levels/effects of sunitinib. Food has no effect on the bioavailability of sunitinib.

Herb/Nutraceutical: Avoid St John's wort (may increase metabolism and decrease sunitinib concentrations).

Monitoring ParametersLVEF, baseline (and periodic with cardiac risk factors), ECG (12-lead; baseline and periodic), blood pressure, adrenal function, CBC with differential and platelets (prior to each treatment cycle), serum chemistries including magnesium, phosphate, and potassium (prior to each treatment cycle), thyroid function (baseline; then if symptomatic), urinalysis (for proteinuria development or worsening)

Monitoring: Lab TestsLVEF, baseline (and periodic with cardiac risk factors), blood pressure, adrenal function, CBC with differential and platelets (prior to each treatment cycle), serum chemistries including magnesium, phosphate, and potassium (prior to each treatment cycle), thyroid function (baseline; then if symptomatic), urinalysis (for proteinuria development or worsening)

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Sutent®: 12.5 mg, 25 mg, 50 mg

Generic AvailableNo

ManufacturerPfizer, Inc

Pricing: U.S. (www.drugstore.com)

Capsules (Sutent)

12.5 mg (28): $2056.00

25 mg (28): $4224.25

50 mg (28): $7612.23

Mechanism of ActionExhibits antitumor and antiangiogenic properties by inhibiting multiple receptor tyrosine kinases, including platelet-derived growth factors (PDGFRα and PDGFRβ), vascular endothelial growth factors (VEGFR1, VEGFR2, and VEGFR3), FMS-like tyrosine kinase-3 (FLT3), colony-stimulating factor type 1 (CSF-1R), and glial cell-line-derived neurotrophic factor receptor (RET).

Pharmacodynamics/Kinetics

Distribution: V_d/F: 2230 L

Protein binding: Sunitinib: 95%; SU12662: 90%

Metabolism: Hepatic; primarily metabolized by CYP3A4 to the N-desethyl metabolite SU12662 (active)

Half-life elimination: Sunitinib: 40-60 hours; SU12662: 80-110 hours

Time to peak, plasma: 6-12 hours

Excretion: Feces (61%); urine (16%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), mucositis/stomatitis, taste perversion, and oral pain.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsSunitinib is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusFatigue and dizziness are common

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; combined use with lithium, valproic acid, carbamazepine, and SSRIs may produce an additive risk. Neutropenia and thrombocytopenia are common; concomitant use with clozapine, carbamazepine, and valproic acid may produce additive risks. Carbamazepine and St John's wort may reduce the effectiveness of sunitinib.

Suramin

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(SUR a min)

Pharmacologic CategoryAntineoplastic Agent

Use: Unlabeled/InvestigationalInvestigational: Treatment of prostate cancer; chemosensitizing agent in treatment of various solid tumors

Dosing: AdultsRefer to individual protocols.

Prostate cancer: I.V.: 350 mg/m^2/day continuous I.V. infusion for 7 days, then titrated to a plasma level of 250-300 mcg/mL for 7 days, repeated after an 8-week interval.

Titrate to a plasma level of 300 mcg/mL for 14 days, repeat after an 8-week interval.

Chemosensitizing agent: I.V.: Doses are not yet established; anticipated to be significantly lower than cancer treatment doses.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentDosage reductions have been suggested for “severe” renal dysfunction; however, specific guidelines have not been published.

Dosing: Hepatic ImpairmentDosage reductions of 50% to 75% have been suggested for “severe” hepatic dysfunction; however, specific guidelines have not been published.

Calculations

- Body Surface Area: Adults

Administration: I.V.Usually administered as a carefully titrated continuous infusion

StorageSolutions of 10 mg/mL in saline or dextrose solutions are stable for up to 2 weeks at room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to suramin or any component of the formulation

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with significant hepatic impairment.
- Hypoalbuminemia: Use with caution in patients with decreased serum albumin levels.
- Malnourishment: Use with caution in patients who are malnourished.

Adverse Reactions

>10%:

Central nervous system: Fever (78%), headache; palmar and plantar hyperesthesia occur at levels >350 mcg/mL

Dermatologic: Rash (48%)

Endocrine & metabolic: Adrenal insufficiency (23%), patients usually require adrenocorticoid therapy; transaminases increased (transient 14%)

Gastrointestinal: Nausea (20%), vomiting (35%), metallic taste

Hematologic: Leukopenia, agranulocytosis, thrombocytopenia (12% to 26%), usually not dose limiting

Hepatic: Transient increases in bilirubin levels (14%)

Neuromuscular & skeletal: Paresthesia, peripheral neuropathy (33%), may be dose limiting; areflexia and paralysis may occur at levels >375 mcg/mL

Ocular: Keratopathy (11%), possibly related to dose and/or rate of infusion

Renal: Mild, nondose-limiting, proteinuria (33%); decrease in creatinine clearance

1% to 10%:

Gastrointestinal: Stomatitis (5%)

Neuromuscular & skeletal: Myalgia (3%)

<1%: Abdominal pain, atrial fibrillation, diarrhea; coagulopathy (dose limiting, inhibits factors V, VIII, IX, X, XI, and XII)

Immediate hypersensitivity reactions, including nausea, vomiting, shock, and loss of consciousness (0.1% to 0.3%); a 100-200 mg (10-20 mg in children) test dose prior to the first treatment cycle is occasionally given

Oncology: VesicantNo; may be an irritant

Oncology: Emetic PotentialModerate (30% to 60%)

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 600 mg

Generic AvailableNo

Mechanism of ActionSuramin inhibits a number of growth factors and enzymes essential to cell proliferation including platelet-derived growth factor (PDGF), fibroblast growth factor, DNA polymerase, glycerol phosphate oxidase, reverse transcriptase, and various lysosomal enzymes. Suramin may also have some angiogenic inhibitory activity.

Pharmacodynamics/Kinetics

Absorption: Not absorbed orally

Distribution: V_d: 31-46 L; does not penetrate the CNS

Protein binding: >99%

Half-life elimination: Triphasic, terminal half-life: 50 days

Excretion: Urine (as unchanged drug); bile (small amounts)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concomitant use with SSRIs, lithium, or valproic acid may produce additive effects. Hematologic effects are common; use caution with clozapine, carbamazepine, and valproic acid derivatives.

Medication Safety Issues

Sound-alike/look-alike issues:

Cognex® may be confused with Corgard®

International issues:

Cognex® may be confused with Codex® which is a brand name for *Saccharomyces boulardii* in Italy

Pronunciation(TAK reen)

U.S. Brand NamesCognex®

Pharmacologic CategoryAcetylcholinesterase Inhibitor (Central)

Use: Labeled IndicationsTreatment of mild-to-moderate dementia of the Alzheimer's type

Use: Unlabeled/InvestigationalLewy body dementia

Dosing: Adults

Alzheimer's disease: Oral: Initial: 10 mg 4 times/day; may increase by 40 mg/day adjusted every 6 weeks; maximum: 160 mg/day; best administered separate from meal times.

Dose adjustment based upon transaminase elevations:

ALT ≤3 times ULN:* Continue titration

ALT >3 to ≤5 times ULN:* Decrease dose by 40 mg/day, resume when ALT returns to normal

ALT >5 times ULN:* Stop treatment, may rechallenge upon return of ALT to normal

*ULN = upper limit of normal

Note: Patients with clinical jaundice confirmed by elevated total bilirubin (>3 mg/dL) should not be rechallenged with tacrine

Dosing: ElderlyRefer to adult dosing.

Dosing: Hepatic ImpairmentPatients with clinical jaundice confirmed by elevated total bilirubin (>3 mg/dL) should not be rechallenged with tacrine.

Dietary ConsiderationsGive with food if GI side effects are intolerable.

ContraindicationsHypersensitivity to tacrine, acridine derivatives, or any component of the formulation; patients previously treated with tacrine who developed jaundice

Warnings/Precautions

Concerns related to adverse effects:

- Abnormal liver function tests: The use of tacrine has been associated with elevations in serum transaminases; serum transaminases (specifically ALT) must be monitored throughout therapy; use extreme caution in patients with current evidence of a history of abnormal liver function tests.
- Diarrhea: May cause loose stools.
- Nausea/vomiting: May cause nausea and/or vomiting.
- Neutropenia: May be associated with neutropenia.
- Vagotonic effects: Cholinesterase inhibitors may have vagotonic effects which may cause bradycardia and/or heart block with or without a history of cardiac disease.

Disease-related concerns:

- Cardiac conduction abnormalities: Use with caution in patients with sick-sinus syndrome, bradycardia, or conduction abnormalities; tacrine may cause bradycardia and/or heart block. Alzheimer's treatment guidelines consider bradycardia to be a relative contraindication for use of centrally-active cholinesterase inhibitors.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Peptic ulcer disease: Use with caution in patients at risk of ulcer disease (eg, previous history or NSAID use); may increase gastric acid secretion. Monitor for symptoms of bleeding.
- Respiratory disease: Use with caution in patients with COPD and/or asthma.

- Seizure disorder: Use with caution in patients with a history of seizure disorder.

- Urinary tract obstruction: Use with caution in patients with bladder outlet obstruction or prostatic hyperplasia; cholinomimetics may cause or worsen outflow obstructions, including possible exacerbation of BPH symptoms.

Concurrent drug therapy issues:

- Depolarizing neuromuscular-blocking agents: May exaggerate neuromuscular blockade effects of depolarizing neuromuscular-blocking agents like succinylcholine.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Discontinuation of therapy: Abrupt discontinuation or dosage decrease may worsen cognitive function.

Geriatric ConsiderationsTacrine is not a cure for Alzheimer's disease. At least 25% of patients may not tolerate the drug and only 50% of patients demonstrate some improvement in symptoms or a slowing of deterioration. While worth a trial in mild-to-moderate dementia of the Alzheimer's type, patients and their families must be counseled about the limitations of the drug and the importance of regular monitoring of liver function tests. No specific dosage adjustments are necessary due to age.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

>10%:

Central nervous system: Dizziness, headache

Gastrointestinal: Diarrhea, nausea, vomiting

Miscellaneous: Transaminases increased

1% to 10%:

Cardiovascular: Flushing

Central nervous system: Ataxia, confusion, depression, fatigue, insomnia, somnolence

Dermatologic: Rash

Gastrointestinal: Abdominal pain, anorexia, constipation, dyspepsia, flatulence, weight loss

Neuromuscular & skeletal: Myalgia, tremor

Respiratory: Rhinitis

Metabolism/Transport Effects**Substrate** of CYP1A2 (major); **Inhibits** CYP1A2 (weak)
Drug Interactions

Anticholinergics: May diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antipsychotics: Acetylcholinesterase Inhibitors (Central) may enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Beta-Blockers: Acetylcholinesterase Inhibitors may enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Cholinergic Agonists: Acetylcholinesterase Inhibitors may enhance the adverse/toxic effect of Cholinergic Agonists. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

Fluvoxamine: May decrease the metabolism of Tacrine. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents (Nondepolarizing): Acetylcholinesterase Inhibitors may diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Succinylcholine: Acetylcholinesterase Inhibitors may enhance the neuromuscular-blocking effect of Succinylcholine. *Risk C: Monitor therapy*

Theophylline Derivatives: Tacrine may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Food decreases bioavailability.

Monitoring ParametersALT levels and other liver enzymes weekly for at least the first 18 weeks, then monitor once every 3 months

Reference RangeIn clinical trials, serum concentrations >20 ng/mL were associated with a much higher risk of development of symptomatic adverse effects

Nursing: Physical Assessment/MonitoringAssess bladder and sphincter adequacy prior to administering medication. Assess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests throughout therapy, therapeutic effectiveness, and adverse reactions (eg, cholinergic crisis). Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsALT levels and other liver enzymes at least every other week from weeks 4-16, then monitor once every 3 months

Patient EducationThis medication will not cure the disease, but may help reduce symptoms. Use as directed; do not increase dose or discontinue without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause dizziness, sedation, or hypotension (rise slowly from sitting or lying position and use caution when driving or climbing stairs); vomiting or loss of appetite (small frequent meals, frequent mouth care, or chewing gum, or sucking lozenges may help); or diarrhea (boiled milk, yogurt, or buttermilk may help). Report persistent abdominal discomfort; significantly increased salivation, sweating, tearing, or urination; flushed skin; chest pain or palpitations; acute headache; unresolved diarrhea; excessive fatigue, insomnia, dizziness, or depression; increased muscle, joint, or body pain; vision changes or blurred vision; shortness of breath or wheezing; or signs of jaundice (yellowing of eyes or skin, dark colored urine or light colored stool, abdominal pain, or easy fatigue). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride: 10 mg, 20 mg, 30 mg, 40 mg

Generic AvailableNo

ManufacturerParke-Davis

Pricing: U.S. (www.drugstore.com)

Capsules (Cognex)

10 mg (120): $315.98

20 mg (120): $309.97

40 mg (120): $311.96

Mechanism of ActionCentrally-acting cholinesterase inhibitor. It elevates acetylcholine in cerebral cortex by slowing the degradation of acetylcholine.

Pharmacodynamics/Kinetics

Absorption: Oral: Rapid

Distribution: V_d: Mean: 349 L; reduced by food

Protein binding, plasma: 55%

Metabolism: Extensively by CYP450 to multiple metabolites; first pass effect

Bioavailability: Absolute: 17%

Half-life elimination, serum: 2-4 hours; Steady-state: 24-36 hours

Time to peak, plasma: 1-2 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Prograf® may be confused with Gengraf®, Prozac®

Tacrolimus may be confused with sirolimus, temsirolimus

Pronunciation(ta KROE li mus)

U.S. Brand NamesPrograf®; Protopic®

Canadian Brand NamesAdvagraf™; Prograf®; Protopic®

Pharmacologic CategoryImmunosuppressant Agent; Topical Skin Product

Use: Labeled Indications

Oral/injection: Potent immunosuppressive drug used in heart, kidney, or liver transplant recipients

Topical: Moderate-to-severe atopic dermatitis in patients not responsive to conventional therapy or when conventional therapy is not appropriate

Use: Unlabeled/InvestigationalPotent immunosuppressive drug used in lung, small bowel transplant recipients; immunosuppressive drug for peripheral stem cell/bone marrow transplantation

Use: DentalTopical: Treatment of severe ulcerative or vesicobullous lesions (usually in consult with patient's physician)

Dosing: Adults

Notes: If switching from I.V. to oral, the oral dose should be started 8-12 hours after stopping the infusion. Adjunctive therapy with corticosteroids is recommended early post-transplant. I.V. route should only be used in patients not able to take oral medications and continued only until oral medication can be tolerated; anaphylaxis has been reported. Begin no sooner than 6 hours post-transplant; adjunctive therapy with corticosteroids is recommended.

Liver transplant:

Oral: Initial dose: 0.1-0.15 mg/kg/day in 2 divided doses, given every 12 hours; begin oral dose no sooner than 6 hours post-transplant

I.V.: Initial dose: 0.03-0.05 mg/kg/day as a continuous infusion

Heart transplant:

Oral: Initial dose: 0.075 mg/kg/day in 2 divided doses, given every 12 hours; begin oral dose no sooner than 6 hours post-transplant

I.V.: Initial dose: 0.01 mg/kg/day as a continuous infusion

Kidney transplant:

Oral: Initial dose: 0.2 mg/kg/day in 2 divided doses, given every 12 hours; initial dose may be given within 24 hours of transplant, but should be delayed until renal function has recovered; African-American patients may require larger doses to maintain trough concentration

I.V.: Initial dose: 0.03-0.05 mg/kg/day as a continuous infusion

Prevention of graft-vs-host disease:*I.V.:* 0.03 mg/kg/day as continuous infusion

Atopic dermatitis (moderate-to-severe):*Topical:* Apply minimum amount of 0.03% or 0.1% ointment to affected area twice daily; rub in gently and completely. Discontinue use when symptoms have cleared. If no improvement within 6 weeks, patients should be re-examined to confirm diagnosis.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Liver transplant:

Oral: Initial dose: 0.15-0.20 mg/kg/day in 2 divided doses, given every 12 hours; begin oral dose no sooner than 6 hours post-transplant

I.V.: Refer to adult dosing.

Notes: Patients without pre-existing renal or hepatic dysfunction have required (and tolerated) higher doses than adults to achieve similar blood concentrations. It is recommended that therapy be initiated at high end of the recommended adult I.V. and oral dosing ranges; dosage adjustments may be required. If switching from I.V. to oral, the oral dose should be started 8-12 hours after stopping the infusion. Adjunctive therapy with corticosteroids is recommended early post-transplant.

Moderate-to-severe atopic dermatitis:*Topical:* Children ≥2 years: Refer to adult dosing.

Dosing: Renal ImpairmentEvidence suggests that lower doses should be used; patients should receive doses at the lowest value of the recommended I.V. and oral dosing ranges; further reductions in dose below these ranges may be required.

Tacrolimus therapy should usually be delayed up to 48 hours or longer in patients with postoperative oliguria.

Hemodialysis: Not removed by hemodialysis; supplemental dose is not necessary.

Peritoneal dialysis: Significant drug removal is unlikely based on physiochemical characteristics.

Dosing: Hepatic ImpairmentUse of tacrolimus in liver transplant recipients experiencing post-transplant hepatic impairment may be associated with increased risk of developing renal insufficiency related to high whole blood levels of tacrolimus. The presence of moderate-to-severe hepatic dysfunction (serum bilirubin >2 mg/dL; Child-Pugh score ≥10) appears to affect the metabolism of tacrolimus. The half-life of the drug was prolonged and the clearance reduced after I.V. administration. The bioavailability of tacrolimus was also increased after oral administration. The higher plasma concentrations as determined by ELISA, in patients with severe hepatic dysfunction are probably due to the accumulation of metabolites of lower activity. These patients should be monitored closely and dosage adjustments should be considered. Some evidence indicates that lower doses could be used in these patients.

Administration: I.V.Administer by I.V. continuous infusion only. Do not use PVC tubing when administering dilute solutions. Tacrolimus is dispensed in a 50 mL glass container with no overfill. It is usually intended to be administered as a continuous infusion over 24 hours.

Administration: I.V. DetailDo not mix with acyclovir or ganciclovir due to chemical degradation of tacrolimus (use different ports in multilumen lines). Do not alter dose with concurrent T-tube clamping. Adsorption of the drug to PVC tubing may become clinically significant with low concentrations.

Administration: OralIf dosed once daily (not common), administer in the morning. If dosed twice daily, doses should be 12 hours apart. If the morning and evening doses differ, the larger dose (differences are never >0.5-1 mg) should be given in the morning. If dosed 3 times/day, separate doses by 8 hours.

Administration: TopicalDo not use with occlusive dressings. Burning at the application site is most common in first few days; improves as atopic dermatitis improves. Limit application to involved areas. Continue as long as signs and symptoms persist; discontinue if resolution occurs; re-evaluate if symptoms persist >6 weeks.

Dietary ConsiderationsCapsule: Take on an empty stomach; be consistent with timing and composition of meals if GI intolerance occurs (per manufacturer).

Storage

Injection: Prior to dilution, store at 5°C to 25°C (41°F to 77°F). Following dilution, stable for 24 hours in D_5W or NS in glass or polyolefin containers.

Capsules and ointment: Store at room temperature of 15°C to 30°C (59°F to 86°F).

ReconstitutionDilute with 5% dextrose injection or 0.9% sodium chloride injection to a final concentration between 0.004 mg/mL and 0.02 mg/mL.

Compatibility**Variable stability (consult detailed reference)** in D_5W, NS (only in glass or polyolefin containers).

Y-site administration: Compatible: Acyclovir, aminophylline, amphotericin B, ampicillin, ampicillin/sulbactam, benztropine, calcium gluconate, cefazolin, cefotetan, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, clindamycin, co-trimoxazole, dexamethasone sodium phosphate, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, erythromycin lactobionate, esmolol, fluconazole, furosemide, ganciclovir, gentamicin, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, insulin (regular), isoproterenol, leucovorin, lorazepam, methylprednisolone sodium succinate, metoclopramide, metronidazole, morphine, multivitamins, nitroglycerin, oxacillin, penicillin G potassium, perphenazine, phenytoin, piperacillin, potassium chloride, propranolol, ranitidine, sodium bicarbonate, sodium nitroprusside, sodium tetradecyl sulfate, tobramycin, vancomycin.

Compatibility when admixed: Compatible: Cimetidine.

Extemporaneously PreparedTacrolimus 0.5 mg/mL oral suspension: Mix the contents of six 5-mg tacrolimus capsules with equal amounts of Ora-Plus® and Simple Syrup, N.F., to make a final volume of 60 mL. The suspension is stable for 56 days at room temperature in glass or plastic amber prescription bottles.

Esquivel C, So S, McDiarmid S, Andrews W, and Colombani PM, “Suggested Guidelines for the Use of Tacrolimus in Pediatric Liver Transplant Patients,” *Transplantation*, 1996, 61(5):847-8.

Foster JA, Jacobson PA, Johnson CE, et al, “Stability of Tacrolimus in an Extemporaneously Compounded Oral Liquid (Abstract of Meeting Presentation),” *American Society of Health-System Pharmacists Annual Meeting*, 1996, 53:P-52(E).

Tacrolimus 1 mg/mL oral suspension: Mix the contents of six 5-mg capsules in approximately 5 mL of sterile water; add capsule contents to an empty amber bottle first, then add sterile water and agitate bottle until drug disperses and a slurry is formed. Add equal parts of Ora-Plus® (suspending agent) and Ora-Sweet® (sweetening agent) to a total volume of 30 mL. The suspension is stable for 4 months at room temperature in plastic amber prescription bottles.

Elefante A, Muindi J, West K, et al, “Long-Term Stability of a Patient-Convenient 1 mg/mL Suspension of Tacrolimus for Accurate Maintenance of Stable Therapeutic Levels,” *Bone Marrow Transplant*, 2006, 37(8):781-4.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing the outpatient prescription (new or refill) for tacrolimus ointment where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to tacrolimus or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Injection/oral: See “Dosage form specific issues” below.
- Topical: See “Dosage form specific issues” below.

Dosage form specific issues:

- Injection/oral: Insulin-dependent post-transplant diabetes mellitus (PTDM) has been reported (1% to 20%); risk increases in African-American and Hispanic kidney transplant patients. **[U.S. Boxed Warning]: Increased susceptibility to infection and the possible development of lymphoma may result from immunosuppression with tacrolimus.** Nephrotoxicity and neurotoxicity have been reported, especially with higher doses; to avoid excess nephrotoxicity do not administer simultaneously with cyclosporine; monitoring of serum concentrations (trough for oral therapy) is essential to prevent organ rejection and reduce drug-related toxicity. Tonic clonic seizures may have been triggered by tacrolimus. A period of 24 hours should elapse between discontinuation of cyclosporine and the initiation of tacrolimus. Use caution in renal or hepatic dysfunction, dosing adjustments may be required. Delay initiation if postoperative oliguria occurs. Use may be associated with the development of hypertension (common). Myocardial hypertrophy has been reported (rare). Each mL of injection contains polyoxyl 60 hydrogenated castor oil (HCO-60) (200 mg) and dehydrated alcohol USP 80% v/v. Anaphylaxis has been reported with the injection, use should be reserved for those patients not able to take oral medications. **[U.S. Boxed Warning]: Should be administered under the supervision of a physician experienced in immunosuppressive therapy in a facility appropriate for monitoring and managing therapy.**

- Topical: **[U.S. Boxed Warning]: Topical calcineurin inhibitors have been associated with rare cases of malignancy (including skin and lymphoma), therefore it should be limited to short-term and intermittent treatment using the minimum amount necessary for the control of symptoms and only on involved areas. Use in children <2 years of age is not recommended, children ages 2-15 should only use the 0.03% ointment.** Avoid use on malignant or premalignant skin conditions (eg cutaneous T-cell lymphoma). Should not be used in immunocompromised patients. Do not apply to areas of active bacterial or viral infection; infections at the treatment site should be cleared prior to therapy. Topical calcineurin agents are considered second-line therapies in the treatment of atopic dermatitis/eczema, and should be limited to use in patients who have failed treatment with other therapies. Patients with atopic dermatitis are predisposed to skin infections, and tacrolimus therapy has been associated with risk of developing eczema herpeticum, varicella zoster, and herpes simplex. If atopic dermatitis is not improved in <6 weeks, re-evaluate to confirm diagnosis. May be associated with development of lymphadenopathy; possible infectious causes should be investigated. Discontinue use in patients with unknown cause of lymphadenopathy or acute infectious mononucleosis. Acute renal failure has been observed (rarely) with topical use. Not recommended for use in patients with skin disease which may increase systemic absorption (eg, Netherton's syndrome). Minimize sunlight exposure during treatment. Safety not established in patients with generalized erythroderma. Safety of intermittent use for >1 year has not been established, particularly since the effect on immune system development is unknown.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTacrolimus crosses the placenta and reaches concentrations four times greater than maternal plasma concentrations. Neonatal hyperkalemia and renal dysfunction have been reported.

The National Transplantation Pregnancy Registry (NTPR, Temple University) is a registry for pregnant women taking immunosuppressants following any solid organ transplant. The NTPR encourages reporting of all immunosuppressant exposures during pregnancy in transplant recipients at 877-955-6877.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsConcentrations in breast milk are equivalent to plasma concentrations; breast-feeding is not advised.

Adverse Reactions

Oral, I.V.:

≥15%:

Cardiovascular: Chest pain, hypertension, pericardial effusion (heart transplant)

Central nervous system: Dizziness, headache, insomnia, tremor (headache and tremor are associated with high whole blood concentrations and may respond to decreased dosage)

Dermatologic: Pruritus, rash

Endocrine & metabolic: Diabetes mellitus, hyperglycemia, hyper-/hypokalemia, hyperlipemia, hypomagnesemia, hypophosphatemia

Gastrointestinal: Abdominal pain, constipation, diarrhea, dyspepsia, nausea, vomiting

Genitourinary: Urinary tract infection

Hematologic: Anemia, leukocytosis, leukopenia, thrombocytopenia

Hepatic: Ascites

Neuromuscular & skeletal: Arthralgia, back pain, paresthesia, tremor, weakness

Renal: Abnormal kidney function, BUN increased, creatinine increased, oliguria, urinary tract infection

Respiratory: Atelectasis, bronchitis, dyspnea, increased cough, pleural effusion

Miscellaneous: CMV infection, infection

<15%:

Cardiovascular: Abnormal ECG (QRS or ST segment abnormal), angina pectoris, cardiopulmonary failure, deep thrombophlebitis, heart rate decreased, hemorrhage, hemorrhagic stroke, hypervolemia, hypotension, generalized edema, peripheral vascular disorder, phlebitis, postural hypotension, tachycardia, thrombosis, vasodilation

Central nervous system: Abnormal dreams, abnormal thinking, agitation, amnesia, anxiety, chills, confusion, depression, dizziness, elevated mood, emotional lability, encephalopathy, hallucinations, nervousness, paralysis, psychosis, quadriparesis, seizure, somnolence

Dermatologic: Acne, alopecia, cellulitis, exfoliative dermatitis, fungal dermatitis, hirsutism, increased diaphoresis, photosensitivity reaction, skin discoloration, skin disorder, skin ulcer

Endocrine & metabolic: Acidosis, alkalosis, Cushing's syndrome, decreased bicarbonate, decreased serum iron, diabetes mellitus, hypercalcemia, hypercholesterolemia, hyperphosphatemia, hypoproteinemia, increased alkaline phosphatase

Gastrointestinal: Anorexia, appetite increased, cramps, duodenitis, dysphagia, enlarged abdomen, esophagitis (including ulcerative), flatulence, gastritis, gastroesophagitis, GI perforation/hemorrhage, ileus, oral moniliasis, pancreatic pseudocyst, rectal disorder, stomatitis, weight gain

Genitourinary: Bladder spasm, cystitis, dysuria, nocturia, oliguria, urge incontinence, urinary frequency, urinary incontinence, urinary retention, vaginitis

Hematologic: Bruising, coagulation disorder, decreased prothrombin, hypochromic anemia, polycythemia

Hepatic: Abnormal liver function tests, ALT increased, AST increased, bilirubinemia, cholangitis, cholestatic jaundice, GGT increased, hepatitis (including granulomatous), jaundice, liver damage, increase LDH

Neuromuscular & skeletal: Hypertonia, incoordination, joint disorder, leg cramps, myalgia, myasthenia, myoclonus, nerve compression, neuropathy, osteoporosis

Ocular: Abnormal vision, amblyopia

Otic: Ear pain, otitis media, tinnitus

Renal: Albuminuria, renal tubular necrosis, toxic nephropathy

Respiratory: Asthma, lung disorder, pharyngitis, pneumonia, pneumothorax, pulmonary edema, respiratory disorder, rhinitis, sinusitis, voice alteration

Miscellaneous: Abscess, abnormal healing, allergic reaction, crying, flu-like syndrome, generalized spasm, hernia, herpes simplex, peritonitis, sepsis, writing impaired

Topical (as reported in children and adults, unless otherwise noted):

>10%:

Central nervous system: Headache (5% to 20%), fever (1% to 21%)

Dermatologic: Skin burning (43% to 58%; tends to improve as lesions resolve), pruritus (41% to 46%), erythema (12% to 28%)

Respiratory: Increased cough (18% children)

Miscellaneous: Flu-like syndrome (23% to 28%), allergic reaction (4% to 12%)

1% to 10%:

Cardiovascular: Peripheral edema (3% to 4% adults)

Central nervous system: Hyperesthesia (3% to 7% adults), pain (1% to 2%)

Dermatologic: Skin tingling (2% to 8%), acne (4% to 7% adults), localized flushing (following ethanol consumption 3% to 7% adults), folliculitis (2% to 6%), urticaria (1% to 6%), rash (2% to 5%), pustular rash (2% to 4%), vesiculobullous rash (4% children), contact dermatitis (3% to 4%), cyst (1% to 3% adults), eczema herpeticum (1% to 2%), fungal dermatitis (1% to 2% adults), sunburn (1% to 2% adults), dry skin (1% children)

Endocrine & metabolic: Dysmenorrhea (4% women)

Gastrointestinal: Diarrhea (3% to 5%), dyspepsia (1% to 4% adults), abdominal pain (3% children), vomiting (1% adults), gastroenteritis (adults 2%), nausea (1% children)

Neuromuscular & skeletal: Myalgia (2% to 3% adults), weakness (2% to 3% adults), back pain (2% adults)

Ocular: Conjunctivitis (2% adults)

Otic: Otitis media (12% children)

Respiratory: Rhinitis (6% children), sinusitis (2% to 4% adults), bronchitis (2% adults), pneumonia (1% adults)

Miscellaneous: Varicella/herpes zoster (1% to 5%), lymphadenopathy (3% children)

Oral, I.V., topical: Postmarketing and/or case reports (limited to important or life-threatening): Acute renal failure, alopecia, anaphylaxis, anaphylactoid reaction, angioedema, ARDS, arrhythmia, atrial fibrillation, atrial flutter, bile duct stenosis, blindness, cardiac arrest, cerebral infarction, cerebrovascular accident, deafness, delirium, depression, DIC, hemiparesis, hemolytic-uremic syndrome, hemorrhagic cystitis, hepatic necrosis, hepatotoxicity, hyperglycemia, leukoencephalopathy, lymphoproliferative disorder (related to EBV), myocardial hypertrophy (associated with ventricular dysfunction; reversible upon discontinuation), MI, neutropenia, pancreatitis (hemorrhagic and necrotizing), pancytopenia, paresthesia, photosensitivity reaction (topical), quadriplegia, QT_c prolongation, respiratory failure, seizure, skin discoloration (topical), Stevens-Johnson syndrome, syncope, toxic epidermal necrolysis, thrombocytopenic purpura, torsade de pointes, TTP, veno-occlusive hepatic disease, venous thrombosis, ventricular fibrillation

Note: Calcineurin inhibitor-induced hemolytic uremic syndrome/thrombotic thrombocytopenic purpura/thrombotic microangiopathy (HUS/TTP/TMA) have been reported (with concurrent sirolimus).

Oncology: VesicantNo
Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP3A4 (weak)
Drug Interactions

Alcohol (Ethyl): Tacrolimus may enhance the dermatologic adverse effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antidepressants (Serotonin Reuptake Inhibitor/Antagonist): May decrease the metabolism of Tacrolimus. **Exceptions:** TraZODone. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Tacrolimus. **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Dihydropyridine): May increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Tacrolimus. *Risk C: Monitor therapy*

Caspofungin: May decrease the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Cinacalcet: May decrease the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Fluconazole: May decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Grapefruit Juice: May decrease the metabolism of Tacrolimus. *Risk X: Avoid combination*

Macrolide Antibiotics: May increase the serum concentration of Tacrolimus. **Exceptions:** Dirithromycin [Off Market]; Spiramycin. *Risk C: Monitor therapy*

MetroNIDAZOLE: May decrease the metabolism of Calcineurin Inhibitors. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Tacrolimus. Tacrolimus may increase the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sirolimus: May enhance the adverse/toxic effect of Tacrolimus. An increased risk of calcineurin inhibitor-induced hemolytic uremic syndrome/thrombotic thrombocytopenic purpura/thrombotic microangiopathy (HUS/TTP/TMA) has been described. *Risk D: Consider therapy modification*

St Johns Wort: May decrease the serum concentration of Tacrolimus. *Risk D: Consider therapy modification*

Temsirolimus: May enhance the adverse/toxic effect of Tacrolimus. An increased risk of calcineurin inhibitor-induced hemolytic uremic syndrome/thrombotic thrombocytopenic purpura/thrombotic microangiopathy (HUS/TTP/TMA) has been described with concomitant sirolimus and tacrolimus use. *Risk D: Consider therapy modification*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Localized flushing (redness, warm sensation) may occur at application site of topical tacrolimus following ethanol consumption.

Food: Decreases rate and extent of absorption. High-fat meals have most pronounced effect (35% decrease in AUC, 77% decrease in C_{max}). Grapefruit juice, CYP3A4 inhibitor, may increase serum level and/or toxicity of tacrolimus; avoid concurrent use.

Herb/Nutraceutical: St John's wort: May reduce tacrolimus serum concentrations (avoid concurrent use).

Monitoring ParametersRenal function, hepatic function, serum electrolytes (especially potassium), glucose and blood pressure, measure 3 times/week for first few weeks, then gradually decrease frequency as patient stabilizes. Whole blood concentrations should be used for monitoring (trough for oral therapy). Signs/symptoms of anaphylactic reactions during infusion should also be monitored. Patients should be monitored during the first 30 minutes of the infusion, and frequently thereafter.

Reference Range

Heart: Typical whole blood trough concentrations:

One week to 3 months: 8-20 ng/mL

Months 3-18: 6-18 ng/mL

Kidney transplant: Whole blood trough concentrations:

Months 1-3: 7-20 ng/mL

Months 4-12: 5-15 ng/mL

Liver transplant: Whole blood trough concentrations: Months 1-12: 5-20 ng/mL

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor blood pressure frequently. Assess results of laboratory tests prior to, during, and following therapy. Monitor response to therapy and adverse reactions. Patients with diabetes should be advised to monitor glucose levels closely (this medication may alter glucose levels). Monitor/instruct patient on appropriate use, interventions to reduce side effects, to monitor for signs of opportunistic infection, and adverse reactions to report.

Monitoring: Lab TestsRenal function, hepatic function, serum electrolytes (especially potassium), glucose. Since pharmacokinetics show great inter- and intrapatient variability over time, monitoring of serum concentrations (trough for oral therapy) has proven helpful to prevent organ rejection and reduce drug-related toxicity. Measure 3 times/week for first few weeks, then gradually decrease frequency as patient stabilizes.

Patient EducationTake as directed, on an empty stomach. Be consistent with timing and consistency of meals if GI intolerance occurs (per manufacturer). Do not take within 2 hours before or after antacids. Do not alter dose and do not discontinue without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) during entire course of therapy unless instructed to restrict fluid intake. You will be susceptible to infection (avoid crowds and exposure to infection). If you have diabetes, monitor glucose levels closely (drug may alter glucose levels). You may experience nausea, vomiting, loss of appetite (small frequent meals, frequent mouth care may help); diarrhea (boiled milk, yogurt, or buttermilk may help); constipation (increased exercise, fluids, fruit, fluid, or fiber may help; if unresolved, consult prescriber); or muscle or back pain (mild analgesics may be recommended). Report chest pain; acute headache or dizziness; symptoms of respiratory infection, cough, or respiratory difficulty; unresolved GI effects; fatigue, chills, fever, unhealed sores, white plaques in mouth, irritation in genital area; unusual bruising or bleeding; pain or irritation on urination or change in urinary patterns; rash or skin irritation; or other unusual effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Topical: Before applying, wash area gently and thoroughly. Apply in thin film to affected area. Do not cover skin with bandages. Wash hands only if not treating skin on the hands. Protect skin from sunlight or exposure to UV light.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule (Prograf®): 0.5 mg, 1 mg, 5 mg

Injection, solution (Prograf®): 5 mg/mL (1 mL) [contains dehydrated alcohol 80% and polyoxyl 60 hydrogenated castor oil]

Ointment, topical (Protopic®): 0.03% (30 g, 60 g, 100 g); 0.1% (30 g, 60 g, 100 g)

Generic AvailableNo

ManufacturerFujisawa Healthcare, Inc

Pricing: U.S. (www.drugstore.com)

Capsules (Prograf)

0.5 mg (120): $245.99

1 mg (100): $409.93

5 mg (60): $1404.00

Ointment (Protopic)

0.03% (30): $111.92

0.03% (60): $211.40

0.1% (30): $104.71

0.1% (60): $204.73

0.1% (100): $339.92

Mechanism of ActionSuppresses cellular immunity (inhibits T-lymphocyte activation), possibly by binding to an intracellular protein, FKBP-12

Pharmacodynamics/Kinetics

Absorption: Better in resected patients with a closed stoma; unlike cyclosporine, clamping of the T-tube in liver transplant patients does not alter trough concentrations or AUC

Oral: Incomplete and variable; food within 15 minutes of administration decreases absorption (27%)

Topical: Serum concentrations range from undetectable to 20 ng/mL (<5 ng/mL in majority of adult patients studied)

Protein binding: 99%

Metabolism: Extensively hepatic via CYP3A4 to eight possible metabolites (major metabolite, 31-demethyl tacrolimus, shows same activity as tacrolimus *in vitro*)

Bioavailability: Oral: Adults: 7% to 28%, Children: 10% to 52%; Topical: <0.5%; Absolute: Unknown

Half-life elimination: Variable, 21-61 hours in healthy volunteers

Time to peak: 0.5-4 hours

Excretion: Feces (~92%); feces/urine (<1% as unchanged drug)

Pharmacotherapy PearlsAdditional dosing considerations:

Switch from I.V. to oral therapy: Threefold increase in dose

Pediatric patients: About 2 times higher dose compared to adults

Liver dysfunction: Decrease I.V. dose; decrease oral dose

Renal dysfunction: Does not affect kinetics; decrease dose to decrease levels if renal dysfunction is related to the drug

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis, oral moniliasis, dysphagia, and esophagitis (including ulcerative).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusInsomnia is common

Mental Health: Effects on Psychiatric TreatmentContraindicated with ziprasidone; barbiturates and carbamazepine may decrease the effects of tacrolimus

Cardiovascular ConsiderationsTacrolimus administration has been associated with torsade de pointes. Use with caution in patients at higher risk for proarrhythmia. Correct any underlying conditions that may increase the risk of torsade de pointes prior to tacrolimus administration.

Anesthesia and Critical Care Concerns/Other Considerations

Additional dosing considerations:

Switch from I.V. to oral therapy: Threefold increase in dose

Pediatric patients: About 2 times higher dose compared to adults

Liver dysfunction: Decrease I.V. dose; decrease oral dose

Renal dysfunction: Does not affect kinetics; decrease dose to decrease levels if renal dysfunction is related to the drug

Tacrolimus is associated with more neurotoxicity, nephrotoxicity, and glucose intolerance but less hypertension, dyslipidemia, gingival hyperplasia, or hirsutism than cyclosporine.

Tadalafil

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Tadalafil may be confused with sildenafil, vardenafil

Pronunciation(tah DA la fil)

U.S. Brand NamesCialis®

Canadian Brand NamesCialis®

Pharmacologic CategoryPhosphodiesterase-5 Enzyme Inhibitor

Use: Labeled IndicationsTreatment of erectile dysfunction (ED)

Dosing: Adults**Erectile dysfunction:** Oral:

As-needed dosing: 10 mg at least 30 minutes prior to anticipated sexual activity (dosing range: 5-20 mg); to be given as one single dose and not given more than once daily. **Note:** Erectile function may be improved for up to 36 hours following a single dose; adjust dose.

Once-daily dosing: 2.5 mg once daily (dosing range: 2.5-5 mg/day) to be given at approximately the same time daily without regard to timing of sexual activity

Dosing adjustment with concomitant medications:

Alpha$_1$-blockers: If stabilized on either alpha-blockers or tadalafil therapy, initiate new therapy with the other agent at the lowest possible dose.

CYP3A4 inhibitors: Dose reduction of tadalafil is recommended with strong CYP3A4 inhibitors. When used on an as-needed basis, the dose of tadalafil should not exceed 10 mg, and tadalafil should not be taken more frequently than once every 72 hours. When used on a once-daily basis, the dose of tadalafil should not exceed 2.5 mg. Examples of such inhibitors include amprenavir, atazanavir, clarithromycin, conivaptan, delavirdine, diclofenac, fosamprenavir, imatinib, indinavir, isoniazid, itraconazole, ketoconazole, miconazole, nefazodone, nelfinavir, nicardipine, propofol, quinidine, ritonavir, and telithromycin.

Dosing: ElderlyRefer to adult dosing. No dose adjustment for patients >65 years of age; use with caution in patients with concomitant medications or renal/hepatic impairment.

Dosing: Renal Impairment

As-needed use:

Cl_{cr} 51-80 mL/minute: Dosage adjustment not required.

Cl_{cr} 31-50 mL/minute: Initial dose 5 mg once daily; maximum dose 10 mg not to be given more frequently than every 48 hours.

Cl_{cr} <30 mL/minute and on hemodialysis: Maximum dose 5 mg not to be given more frequently than every 72 hours.

Once-daily use:

Cl_{cr} 51-80 mL/minute: Dosage adjustment not required.

Cl_{cr} 31-50 mL/minute: Dose adjustment not needed.

Cl_{cr} <30 mL/minute and on hemodialysis: Use not recommended.

Dosing: Hepatic Impairment

As-needed use:

Mild-to-moderate hepatic impairment (Child-Pugh class A or B): Use with caution; dose should not exceed 10 mg once daily.

Severe hepatic impairment (Child-Pugh class C): Use is not recommended.

Once-daily use:

Mild-to-moderate hepatic impairment (Child-Pugh class A or B): Use with caution.

Severe hepatic impairment: Use is not recommended.

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered with or without food, prior to anticipated sexual activity. When used on an as-needed basis, should be taken at least 30 minutes prior to sexual activity. When used on a once-daily basis, should be taken at the same time each day, without regard to timing of sexual activity.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsConcurrent use (regularly/intermittently) of organic nitrates in any form (eg, nitroglycerin, isosorbide dinitrate)

Warnings/Precautions

Concerns related to adverse effects:

- Color discrimination: May cause dose-related impairment of color discrimination. Use caution in patients with retinitis pigmentosa; a minority have genetic disorders of retinal phosphodiesterases (no safety information available).

- Hearing loss: Sudden decrease or loss of hearing has been reported rarely; hearing changes may be accompanied by tinnitus and dizziness. A direct relationship between therapy and hearing loss has not been determined.

- Hypotension: Decreases in blood pressure may occur due to vasodilator effects; use with caution in patients with left ventricular outflow obstruction (aortic stenosis or hypertrophic obstructive cardiomyopathy); may be more sensitive to hypotensive actions. Concurrent use with alpha-adrenergic antagonist therapy or substantial alcohol consumption may cause symptomatic hypotension; patients should be hemodynamically stable prior to initiating therapy at the lowest possible dose.

- Priapism: Painful erection >6 hours in duration; rare. Educate patient to seek medical assistance for erection lasting >4 hours.

- Vision loss: Vision loss may occur rarely and be a sign of nonarteritic anterior ischemic optic neuropathy (NAION). Risk may be increased with history of vision loss. Other risk factors for NAION include low cup-to-disc ratio ("crowded disc"), coronary artery disease, diabetes, hypertension, hyperlipidemia, smoking, and >50 years of age. Safety and efficacy were not studied in patients with known degenerative retinal disorders (eg, retinitis pigmentosa); use is not recommended. A direct relationship between therapy and hearing loss has not been determined.

Disease-related concerns:

- Anatomical penis deformation: Use with caution in patients with anatomical deformation of the penis (angulation, cavernosal fibrosis, or Peyronie's disease).

- Bleeding disorders: Use with caution in patients with bleeding disorders; safety and efficacy have not been established. *In vitro* studies have suggested a decreased effect on platelet aggregation.

- Cardiovascular disease: Use with caution in patients with hypotension (<90/50 mm Hg), uncontrolled hypertension (>170/100 mm Hg), NYHA class II-IV heart failure within the last 6 months, uncontrolled arrhythmias, stroke within the last 6 months, MI within the last 3 months; safety and efficacy have not been studied in these patients. Use caution in patients with left ventricular outflow obstruction (eg, aortic stenosis). There is a degree of cardiac risk associated with sexual activity; therefore, physicians may wish to consider the cardiovascular status of their patients prior to initiating any treatment for erectile dysfunction.

- Conditions predisposing to priapism: Use with caution in patients who have conditions which may predispose them to priapism (sickle cell anemia, multiple myeloma, leukemia). All patients should be instructed to seek immediate medical attention if erection persists >4 hours.

- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment/limitation is needed.

- Peptic ulcer disease: Use with caution in patients with active peptic ulcer disease; safety and efficacy have not been established.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment/limitation is needed.

Concurrent drug therapy issues:

- Alpha-blockers: Use with caution in patients taking alpha-blockers; may cause hypotension. Safety of this combination may be affected by other antihypertensives and intravascular volume depletion. Patients should be hemodynamically stable prior to initiating therapy. Initiate tadalafil at the lowest recommended dose. Alpha-blockers should be initiated at the lowest recommended dose in patients currently taking tadalafil.

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions. Once-daily tadalafil dosing results in continuous plasma levels; use caution when administered concurrently with medications.

- Nitrates: Concomitant use (regularly/intermittently) with all forms of nitrates is contraindicated. If nitrate administration is medically necessary following the use of tadalafil, at least 48 hours should elapse after the tadalafil dose and nitrate administration and should be given under close medical supervision with hemodynamic monitoring.

- Other treatments for erectile dysfunction: Safety and efficacy with other treatments for erectile dysfunction have not been established; use is not recommended.

Special populations:

- Elderly: Use with caution.

- Pediatrics: Safety and efficacy have not been established in children ≤18 years of age.

Other warnings/precautions:

- Appropriate use: Potential underlying causes of erectile dysfunction should be evaluated prior to treatment.

Geriatric ConsiderationsNo significant differences in pharmacokinetics were seen in elderly men versus younger men. Dosing should be adjusted for renal function. Since older adults often have concomitant diseases, many of which may be contraindicated with the use of tadalafil, prescriber should complete a thorough review of diseases and medications prior to prescribing tadalafil.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic events were not reported in animal reproduction studies. Postnatal development and pup survival was decreased at some doses. Tadalafil is not indicated for use in women. Less than 0.0005% is found in the semen of healthy males.

LactationExcretion in breast milk unknown

Breast-Feeding ConsiderationsTadalafil is not indicated for use in women

Adverse ReactionsSimilar adverse events are reported with once-daily dosing, but are generally lower than with doses used as needed.

>10%: Central nervous system: Headache (3% to 15%)

2% to 10%:

Cardiovascular: Flushing (1% to 3%), hypertension (1% to 3%)

Gastrointestinal: Dyspepsia (3% to 10%)

Neuromuscular & skeletal: Back pain (3% to 6%), CPK increased (2%), myalgia (1% to 4%), limb pain (1% to 3%)

Respiratory: Upper respiratory tract infection (3% to 4%), cough (2% to 4%), nasal congestion (2% to 4%)

<2%, postmarketing, and/or case reports: Abdominal pain (upper), amnesia (transient global), angina pectoris, arthralgia, blurred vision, chest pain, color perception change, color vision decreased, conjunctival hyperemia, conjunctivitis, diaphoresis, diarrhea, dizziness, dysphagia, dyspnea, epistaxis, esophagitis, exfoliative dermatitis, eye pain, eyelid swelling, facial edema, fatigue, gastritis, gastroesophageal reflux, hearing decreased, hearing loss, hepatic enzymes increased, hyper-/hypotension, hypoesthesia, GGTP increased, insomnia, lacrimation, migraine, MI, nausea, neck pain, nonarteritic ischemic optic neuropathy, pain, palpitation, paresthesia, pharyngitis, photophobia, postural hypotension, priapism (reported with drugs in this class), pruritus, rash, retinal artery occlusion, retinal vein occlusion, seizure, somnolence, Stevens-Johnson syndrome, stroke, sudden cardiac death, syncope, tachycardia, tinnitus, urinary tract infection, urticaria, vertigo, visual changes (color vision), visual field loss, vomiting, weakness, xerostomia

Metabolism/Transport Effects**Substrate of** CYP3A4 (major)

Drug Interactions

Alpha1-Blockers: Phosphodiesterase 5 Inhibitors may enhance the hypotensive effect of Alpha1-Blockers. **Exceptions:** Dapiprazole [Off Market]. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Phosphodiesterase 5 Inhibitors. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Etravirine: May decrease the serum concentration of Phosphodiesterase 5 Inhibitors. Management: No empiric dosage adjustments are recommended with concomitant therapy; however, dose of the phosphodiesterase inhibitor may need to be altered based on clinical response. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Phosphodiesterase 5 Inhibitors. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the metabolism of Phosphodiesterase 5 Inhibitors. Management: Dose restrictions for tadalafil, and/or sildenafil and vardenafil are recommended in combination with ritonavir, atazanavir, indinavir, darunavir and saquinavir. Consult specific prescribing information for detailed recommendations. *Risk D: Consider therapy modification*

Sapropterin: May enhance the hypotensive effect of Phosphodiesterase 5 Inhibitors. *Risk C: Monitor therapy*

Vasodilators (Organic Nitrates): Phosphodiesterase 5 Inhibitors may enhance the vasodilatory effect of Vasodilators (Organic Nitrates). *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Substantial consumption of ethanol may increase the risk of hypotension and orthostasis. Lower ethanol consumption has not been associated with significant changes in blood pressure or increase in orthostatic symptoms.

Food: Rate and extent of absorption are not affected by food. Grapefruit juice may increase serum levels/toxicity of tadalafil. When used on an as-needed basis, do not give more than a single 10 mg dose of tadalafil more frequently than every 72 hours in patients who regularly consume grapefruit juice. When used on a once-daily basis, the dose of tadalafil should not exceed 2.5 mg/day in patients who regularly consume grapefruit juice.

Herb/Nutraceutical: St John's wort: Use caution with concomitant use.

Monitoring ParametersMonitor for response and adverse effects.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescription, OTC medications, or herbal products patient may be using. Assess for therapeutic effectiveness and adverse reactions. Instruct patient on appropriate use and cautions, possible side effects, and symptoms to report.

Patient EducationInform prescriber of all other prescriptions, OTC medications, or herbal products you are taking and any allergies you have; serious side effects can result when tadalafil is used with some other medications. Avoid substantial consumption of alcohol. Do not combine tadalafil with other approaches to treating erectile dysfunction without consulting prescriber. **Note:** This drug provides no protection against sexually-transmitted diseases, including HIV. Take exactly as directed; do not take more often than prescribed. You may experience headache, fatigue, dizziness, or blurred vision (use caution when driving or engaging in hazardous tasks until response to drug is known); back or limb pain (consult prescriber for appropriate analgesic). Report immediately chest pain, palpitations; respiratory difficulty; unusual dizziness; change in vision; change in hearing or ringing in the ears; sign of urinary tract infection; skin rash; genital swelling or priapism, erection lasting >4 hours, or other persistent adverse reactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Cialis®: 2.5 mg, 5 mg, 10 mg, 20 mg

Generic AvailableNo

ManufacturerLilly

Pricing: U.S. (www.drugstore.com)

Tablets (Cialis)

2.5 mg (10): $49.99

5 mg (10): $49.99

10 mg (10): $149.99

20 mg (10): $149.97

Mechanism of ActionDoes not directly cause penile erections, but affects the response to sexual stimulation. The physiologic mechanism of erection of the penis involves release of nitric oxide (NO) in the corpus cavernosum during sexual stimulation. NO then activates the enzyme guanylate cyclase, which results in increased levels of cyclic guanosine monophosphate (cGMP), producing smooth muscle relaxation and inflow of blood to the corpus cavernosum. Tadalafil enhances the effect of NO by inhibiting phosphodiesterase type 5 (PDE-5), which is responsible for degradation of cGMP in the corpus cavernosum; when sexual stimulation causes local release of NO, inhibition of PDE-5 by tadalafil causes increased levels of cGMP in the corpus cavernosum, resulting in smooth muscle relaxation and inflow of blood to the corpus cavernosum. At recommended doses, it has no effect in the absence of sexual stimulation.

Pharmacodynamics/Kinetics

Onset of action: Within 1 hour

Duration: Up to 36 hours

Distribution: V_d: 63 L

Protein binding: 94%

Metabolism: Hepatic, via CYP3A4 to metabolites (inactive)

Half-life elimination: 17.5 hours

Time to peak, plasma: ~2 hours (range: 30 minutes to 6 hours)

Excretion: Feces (61%, as metabolites); urine (36%, as metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, insomnia, or fatigue

Mental Health: Effects on Psychiatric TreatmentConcurrent use with antidepressants (eg, TCAs) and antipsychotics may produce significant hypotension secondary to alpha-receptor blockade; alpha-blockers contraindicated with tadalafil (except tamsulosin). Nefazodone may increase levels of tadalafil; dosage adjustment needed.

Cardiovascular ConsiderationsTadalafil, when used in conjunction with nitrates, may be associated with severe hypotension, myocardial infarction, and possibly death. While there are no clear significant increased cardiovascular events with PDE-5 inhibitors alone, these drugs should be absolutely avoided in conjunction with nitrates and may also induce significant and possibly fatal hypotension in patients with heart failure. Hemodynamic effects of PDE-5 inhibitors alone include a very slight drop in blood pressure without significant changes in heart rate. The most recent guidelines on the use of sildenafil (prototype PDE-5 inhibitor) in patients with cardiovascular disease are outlined in detail (Cheitlin, 1999). The general clinical recommendations are as follows.

Use of PDE-5 inhibitors is contraindicated in patients currently taking nitrate preparations.

Cardiovascular effects of PDE-5 inhibitors may be potentially hazardous in patients with:

- active coronary ischemia (not on nitrates)
- heart failure and with borderline low blood pressure and borderline low volume status
- complicated, multidrug antihypertensive regimens
- potential for drug-drug interactions that may prolong PDE-5 inhibitor half-life (eg, drugs that inhibit cytochrome P450 3A4)

Additional guidelines for the treatment of ED in patients with cardiovascular disease have also been published (Jackson, 2006). These guidelines, referred to as the Princeton II Guidelines, support the use of PDE-5 inhibition only in patients with asymptomatic coronary disease and <3 of the following risk factors: Controlled hypertension, mild stable angina, successful coronary revascularization, previous uncomplicated MI (>6-8 weeks), mild valvular disease, and left ventricular dysfunction (with or without NYHA Class I limitations).

When nitrate administration becomes medically necessary, the ACC/AHA 2004 guidelines on treatment of ST-segment elevation MI and the ACC/AHA 2007 guidelines on treatment of unstable angina/non ST-segment elevation MI supports administration of nitrates only if 24 hours have elapsed after use of sildenafil and 48 hours after use of tadalafil. The appropriate delay for the use of nitrates after vardenafil has not been determined.

Tadalafil is selective for PDE-5 and has limited effect on PDE-3, which controls cardiac contractility.

Talc (Sterile)

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(talk STARE il)
U.S. Brand NamesSclerosol®; Sterile Talc Powder™
Pharmacologic CategorySclerosing Agent
Use: Labeled IndicationsPrevention of recurrence of malignant pleural effusion in symptomatic patients
Dosing: Adults**Pleural effusion:**

Intrapleural aerosol: 4-8 g (1-2 cans) as a single dose

Intrapleural instillation: 5 g

Administration: I.V.Not for I.V. administration.
Administration: OtherAdminister after adequate drainage of the effusion.

Sclerosol® Intrapleural Aerosol: Shake well and attach delivery tube. Insert delivery tube through pleural trocar, manually press on actuator button of canister to release; point in several different directions to distribute to all pleural surfaces. Keep canister in an upright position. Rate of delivery is 0.4 g per second.

Sterile Talc Powder™: Administer as a slurry. Shake well before instillation. Empty contents of each syringe into chest cavity through the chest tube by gently applying pressure to syringe plunger. After administration, flush with 10-25 mL of NS. Clamp chest tube and have patient rotate from supine to alternating decubitus positions at 20-30 minute intervals for 2 hours. For intrapleural use only; **not for I.V. administration.**

Storage

Sclerosol® Intrapleural Aerosol: Store at room temperature 15°C to 30°C (59°F to 86°F); do not freeze. Protect from heat and light.

Sterile Talc Powder™: Store at controlled room temperature of 18°C to 25°C (64°F to 77°F). Protect from light. Use within 12 hours of slurry preparation.

ReconstitutionSterile Talc Powder™: Vent bottle with needle; slowly add 50 mL of NS to bottle using aseptic technique. For doses >5 g, use a second bottle. Swirl the bottle to disperse talc and avoid settling. Divide the contents of each bottle into two 60 mL irrigation syringes (25 mL of talc slurry in each). Add an additional 25 mL of NS to each syringe for a total of 50 mL (2.5 g/50 mL). If not used immediately, label “For IntraPleural Use Only.”
ContraindicationsThere are no contraindications listed within the manufacturer’s labeling.
Warnings/Precautions

Concerns related to adverse effects:

- Pulmonary effects: Acute pneumonitis and acute respiratory distress syndrome (including one death) have rarely been reported with higher doses (10 g).

Dosage form specific issues:

- Sclerosol®: Contents under pressure and should be kept away from any heat source.

Other warnings/precautions:

- Appropriate use: Should not be used to treat malignancies; does not have antineoplastic activity. Clinicians should evaluate need for future diagnostic procedures before use; sclerosis of pleural space may preclude subsequent procedures (eg, pneumonectomy for transplantation).

Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women; use only if potential benefit outweighs possible risk to the fetus.
Adverse ReactionsFrequency not defined.

Cardiovascular: Asystolic arrest, chest pain, hypotension (transient), hypovolemia, MI, tachycardia

Central nervous system: Fever (generally lasting <24 hours)

Local: Bleeding (localized), infection at administration site, pain

Respiratory: ARDS, bronchopleural fistula, dyspnea, empyema, hemoptysis, hypoxemia, pneumonia, pulmonary edema, pulmonary embolism, subcutaneous emphysema

Nursing: Physical Assessment/MonitoringMonitor patient closely for pain or adverse response following administration.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Aerosol, intrapleural [powder]:

Sclerosol®: 4 g g [contains chlorofluorocarbon]

Powder, intrapleural:

Sterile Talc Powder™: Talc USP (5 g)

Mechanism of Action Induces an inflammatory reaction that promotes adherence of the visceral to the parietal pleura, therefore, preventing reaccumulation of pleural fluid.

Index Terms Intrapleural Talc; Sterile Talc; Talc; Talc for Pleurodesis

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Tamoxifen may be confused with pentoxifylline, Tambocor™

Pronunciation(ta MOKS i fen)

U.S. Brand NamesSoltamox™ [DSC]

Canadian Brand NamesApo-Tamox®; Gen-Tamoxifen; Nolvadex®; Nolvadex®-D; Novo-Tamoxifen; Tamofen®

Pharmacologic CategoryAntineoplastic Agent, Estrogen Receptor Antagonist; Selective Estrogen Receptor Modulator (SERM)

Use: Labeled IndicationsTreatment of metastatic (female and male) breast cancer; adjuvant treatment of breast cancer; reduce risk of invasive breast cancer in women with ductal carcinoma *in situ* (DCIS); reduce the incidence of breast cancer in women at high risk

Use: Unlabeled/InvestigationalTreatment of mastalgia, gynecomastia, melanoma and desmoid tumors; induction of ovulation; treatment of precocious puberty in females, secondary to McCune-Albright syndrome

Dosing: AdultsRefer to individual protocols.

Breast cancer treatment:

Metastatic (males and females) or adjuvant therapy (females): Oral: 20-40 mg/day; daily doses >20 mg should be given in 2 divided doses (morning and evening); doses greater than 20 mg/day are not more effective in adjuvant therapy

DCIS (females): Oral: 20 mg once daily for 5 years

Breast cancer risk reduction (pre- and postmenopausal high-risk females): Oral: 20 mg/day for 5 years

Induction of ovulation (unlabeled use): Oral: 5-40 mg twice daily for 4 days

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricFemale: Precocious puberty and McCune-Albright syndrome (unlabeled use): Oral: A dose of 20 mg/day has been reported in patients 2-10 years of age; safety and efficacy have not been established for treatment of longer than 1 year duration

Dosing: Combination Regimens

Breast cancer: Tamoxifen-Epirubicin

Melanoma:

CCDT (Melanoma)

Dartmouth Regimen

Administration: OralAdminister once or twice daily. Doses >20 mg/day should be given in divided doses.

Storage

Solution: Store at room temperature at or below 25°C (77°F); do not refrigerate or freeze. Protect from light. Use within 3 months of opening.

Tablet: Store at room temperature of 20°C to 25°C (68°F to 77°F). Protect from light.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing the outpatient prescription (new or refill) to females for breast cancer prevention or treatment of ductal carcinoma *in situ* where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to tamoxifen or any component of the formulation; concurrent warfarin therapy or history of deep vein thrombosis or pulmonary embolism (when tamoxifen is used for cancer risk reduction)

Warnings/Precautions

Boxed warnings:

- Serious and life-threatening events: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Thrombocytopenia and/or leukopenia may occur; neutropenia and pancytopenia have been reported rarely.

Although the relationship to tamoxifen therapy is uncertain, rare hemorrhagic episodes have occurred in patients with significant thrombocytopenia.

- Gynecologic effects/malignancies: Endometrial hyperplasia, polyps, endometriosis, uterine fibroids, and ovarian cysts have occurred. May increase risk of uterine or endometrial cancer; monitor. Amenorrhea and menstrual irregularities have been reported with tamoxifen use.

- Hepatotoxicity: Liver abnormalities such as cholestasis, fatty liver, hepatitis, and hepatic necrosis have occurred. Hepatocellular carcinomas have been reported in some studies; relationship to treatment is unclear.

- Ocular effects: Decreased visual acuity, retinal vein thrombosis, retinopathy, corneal changes, color perception changes and increased incidence of cataracts (and the need for cataract surgery) have been reported.

- Serious and life-threatening events: **[U.S. Boxed Warning]: Serious and life-threatening events (including stroke, pulmonary emboli, and uterine malignancy) have occurred at an incidence greater than placebo during use for cancer risk reduction;** these events are rare, but require consideration in risk:benefit evaluation. In patients already diagnosed with breast cancer, the benefits of tamoxifen use are greater than the risks.

- Thromboembolic events: An increased incidence of thromboembolic events, including DVT and pulmonary embolism, has been associated with use for breast cancer; risk is increased with concomitant chemotherapy; use with caution in individuals with a history of thromboembolic events.

Disease-related concerns:

- Bone mineral density: Tamoxifen use may be associated with changes in bone mineral density (BMD) and the effects may be dependant upon menstrual status. In postmenopausal women, tamoxifen use is associated with a protective effect on bone mineral density (BMD), preventing loss of BMD which lasts over the 5-year treatment period. In premenopausal women, a decline (from baseline) in BMD mineral density has been observed in women who continued to menstruate; may be associated with an increased risk of fractures.

- Hyperlipidemia: Use with caution in patients with hyperlipidemias; infrequent postmarketing cases of hyperlipemias have been reported.

- Metastatic breast cancer: Local disease flare and increased bone and tumor pain may occur; may be associated with (good) tumor response; onset is shortly after therapy initiation and usually resolves rapidly. In patients with bone metastasis, hypercalcemia has occurred usually within a few weeks of therapy initiation. Institute appropriate hypercalcemia management; discontinue if severe.

Geriatric ConsiderationsStudies have shown tamoxifen to be effective in the treatment of primary breast cancer in elderly women. Comparative studies with other antineoplastic agents in elderly women with breast cancer had more favorable survival rates with tamoxifen. Initiation of hormone therapy rather than chemotherapy is justified for elderly patients with metastatic breast cancer who are responsive. Reduction of mortality and recurrence was greater in those studies that used tamoxifen for ≥2 years than those that use it for <2 years.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated fetal adverse effects and fetal loss. There are no adequate and well-controlled studies in pregnant women. There have been reports of vaginal bleeding, birth defects and fetal loss in pregnant women. Tamoxifen use during pregnancy may have a potential long term risk to the fetus of a DES-like syndrome. For sexually-active women of childbearing age, initiate during menstruation (negative β-hCG immediately prior to initiation in women with irregular cycles). Tamoxifen may induce ovulation. Barrier or nonhormonal contraceptives are recommended. Pregnancy should be avoided during treatment and for 2 months after treatment has been discontinued.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if tamoxifen is excreted in breast milk, however, it has been shown to inhibit lactation. Reproductive tract defects were observed in neonatal rodents following exposure to tamoxifen. Due to the potential for adverse reactions, women taking tamoxifen should not breast-feed.

Adverse Reactions

>10%:

Cardiovascular: Flushing (33% to 41%), hypertension (11%), peripheral edema (11%)

Central nervous system: Pain (3% to 16%), mood changes (12% to 18%), depression (2% to 12%)

Dermatologic: Skin changes (6% to 19%), rash (13%)

Endocrine & metabolic: Hot flashes (3% to 80%), fluid retention (32%), altered menses (13% to 25%), amenorrhea (16%)

Gastrointestinal: Nausea (5% to 26%), weight loss (23%)

Genitourinary: Vaginal bleeding (2% to 23%), vaginal discharge (13% to 55%)

Neuromuscular & skeletal: Weakness (19%), arthritis (14%), arthralgia (11%)

Respiratory: Pharyngitis (14%)

1% to 10%:

Cardiovascular: Chest pain (5%), venous thrombotic events (5%), edema (4%), cardiovascular ischemia (3%), cerebrovascular ischemia (3%), angina (2%), deep venous thrombus (≤2%), MI (1%)

Central nervous system: Insomnia (9%), dizziness (8%), headache (8%), anxiety (6%), fatigue (4%)

Dermatologic: Alopecia (<1% to 5%)

Endocrine & metabolic: Oligomenorrhea (9%), breast pain (6%), menstrual disorder (6%), breast neoplasm (5%), hypercholesterolemia (4%)

Gastrointestinal: Abdominal pain (9%), weight gain (9%), constipation (4% to 8%), diarrhea (7%), dyspepsia (6%), throat irritation (oral solution 5%), abdominal cramps (1%), anorexia (1%)

Genitourinary: Urinary tract infection (10%), leukorrhea (9%), vaginal hemorrhage (6%), vaginitis (5%), ovarian cyst (3%)

Hematologic: Thrombocytopenia (≤10%), anemia (5%)

Hepatic: AST increased (5%), serum bilirubin increased (2%)

Neuromuscular & skeletal: Back pain (10%), bone pain (6% to 10%), osteoporosis (7%), fracture (7%), arthrosis (5%), myalgia (5%), paresthesia (5%), musculoskeletal pain (3%)

Ocular: Cataract (7%)

Renal: Serum creatinine increased (≤2%)

Respiratory: Cough (4% to 9%), dyspnea (8%), bronchitis (5%), sinusitis (5%)

Miscellaneous: Infection/sepsis (≤9%), diaphoresis (6%), flu-like syndrome (6%), allergic reaction (3%)

<1%, infrequent, or frequency not defined: Cholestasis, corneal changes, endometriosis, endometrial cancer, endometrial hyperplasia, endometrial polyps, fatty liver, hepatic necrosis, hepatitis, hypercalcemia, hyperlipidemia, lightheadedness, phlebitis, pruritus vulvae, pulmonary embolism, retinal vein thrombosis, retinopathy, second primary tumors, stroke, superficial phlebitis, taste disturbances, tumor pain and local disease flare (including increase in lesion size and erythema) during treatment of metastatic breast cancer (generally resolves with continuation), uterine fibroids, vaginal dryness

Postmarketing and/or case reports: Angioedema, bullous pemphigoid, erythema multiforme, hypersensitivity reactions, hypertriglyceridemia, impotence (males), interstitial pneumonitis, loss of libido (males), pancreatitis, Stevens-Johnson syndrome, visual color perception changes

⇧ Oncology: Emetic PotentialLow (10% to 30%)
⇧ Metabolism/Transport Effects**Substrate** of CYP2A6 (minor), 2B6 (minor), 2C9 (major), 2D6 (major), 2E1 (minor), 3A4 (major); **Inhibits** CYP2B6 (weak), 2C8 (moderate), 2C9 (weak), 3A4 (weak), p-glycoprotein
⇧ Drug Interactions

Aminoglutethimide: May increase the metabolism of Tamoxifen. *Risk D: Consider therapy modification*

Anastrozole: Tamoxifen may decrease the serum concentration of Anastrozole. *Risk D: Consider therapy modification*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of Tamoxifen. Specifically, strong CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk X: Avoid combination*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Letrozole: Tamoxifen may decrease the serum concentration of Letrozole. *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Tamoxifen. *Risk C: Monitor therapy*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Tamoxifen may increase the serum concentration of Vitamin K Antagonists. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid black cohosh, dong quai in estrogen-dependent tumors. Avoid St John's wort (may decrease levels/effects of tamoxifen).

Test InteractionsT_4 elevations (which may be explained by increases in thyroid-binding globulin) have been reported; not accompanied by clinical hyperthyroidism

Monitoring ParametersCBC with platelets, serum calcium, LFTs; triglycerides and cholesterol (in patients with pre-existing hyperlipemias); abnormal vaginal bleeding; breast and gynecologic exams (baseline and routine), mammogram (baseline and routine)

Nursing: Physical Assessment/MonitoringUse caution in presence of leukopenia, thrombocytopenia, or hyperlipidemia or history of thrombolytic events. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking (increased or decreased levels/effects of tamoxifen or other drugs administered concurrently). Assess results of CBC and platelet counts, therapeutic effectiveness (eg, complaints of bone pain may be an indication of a good therapeutic effectiveness in metastatic breast cancer patients and will usually subside as treatment continues), and adverse reactions (eg, flushing, fluid retention, hot flashes, vaginal bleeding or discharge, constipation, rash, mood changes). Teach patient proper use, possible side effects/appropriate interventions (eg, periodic ophthalmic evaluations and annual gynecological exams and mammogram with long-term use), and adverse symptoms to report.

Monitoring: Lab TestsCBC with platelets, serum calcium, LFTs; triglycerides and cholesterol (in patients with pre-existing hyperlipemias)

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take exactly as directed. It is important to maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake and adequate nutrition (small frequent meals may help). You should schedule an annual ophthalmic examination, gynecological exam, and mammogram if this medication is used long-term. You may experience hot flashes, hair loss, loss of libido (these will subside when treatment is completed). Bone pain may indicate a good therapeutic responses (consult prescriber for mild analgesics). May cause nausea, vomiting, loss of appetite (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight); hot flashes (a cool room or cool compresses may help). Notify prescriber if menstrual irregularities, vaginal bleeding, or intolerable hot flashes occur. Report unusual bleeding or bruising; severe weakness or unusual fatigue; CNS changes (depression, mood changes); swelling or pain in calves; respiratory difficulty; vision changes; or other adverse effects. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication and for 2 months after treatment is discontinued; consult prescriber for appropriate barrier or nonhormonal contraceptive measures. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Solution, oral:

Soltamox™: 10 mg/5 mL (150 mL) [sugar free; licorice flavor] [DSC]

Tablet: 10 mg, 20 mg

Generic AvailableYes: Tablet

Pricing: U.S. (www.drugstore.com)

Tablets (Nolvadex)

10 mg (60): $114.79

20 mg (60): $220.37

Tablets (Tamoxifen Citrate)

20 mg (30): $21.99

Mechanism of ActionCompetitively binds to estrogen receptors on tumors and other tissue targets, producing a nuclear complex that decreases DNA synthesis and inhibits estrogen effects; nonsteroidal agent with potent antiestrogenic properties which compete with estrogen for binding sites in breast and other tissues; cells accumulate in the G_0 and G_1 phases; therefore, tamoxifen is cytostatic rather than cytocidal.

Pharmacodynamics/Kinetics

Absorption: Well absorbed; tablet and oral solution are bioequivalent

Distribution: High concentrations found in uterus, endometrial and breast tissue

Protein binding: 99%

Metabolism: Hepatic (via CYP3A4) to major metabolites, N-desmethyl tamoxifen (major) and 4-hydroxytamoxifen (minor), and a tamoxifen derivative (minor); undergoes enterohepatic recirculation

Half-life elimination: Distribution: 7-14 hours; Elimination: 5-7 days; Metabolites: 14 days

Time to peak, serum: 5 hours

Excretion: Feces (26% to 51%); urine (9% to 13%)

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy PearlsOral clonidine is being studied for the treatment of tamoxifen-induced “hot flashes.” The tumor flare reaction may indicate a good therapeutic response, and is often considered a good prognostic factor.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness, drowsiness, or confusion

Mental Health: Effects on Psychiatric Treatment May cause leukopenia; use caution with clozapine and carbamazepine

Index TermsICI-46474; Tamoxifen Citrate

Medication Safety Issues

Sound-alike/look-alike issues:

Flomax® may be confused with Flonase®, Flovent®, Foltx®, Fosamax®, Volmax®

Tamsulosin may be confused with tacrolimus, tamoxifen, terazosin

International issues:

Flomax®: Brand name for morniflumate in Italy

Flomax® may be confused with Flomox® which is a brand name for cefcapene in Japan

Pronunciation(tam SOO loe sin)

U.S. Brand NamesFlomax®

Canadian Brand NamesFlomax®; Flomax® CR; Gen-Tamsulosin; Novo-Tamsulosin; Ran-Tamsulosin; ratio-Tamsulosin; Sandoz-Tamsulosin

Pharmacologic CategoryAlpha$_1$ Blocker

Use: Labeled IndicationsTreatment of signs and symptoms of benign prostatic hyperplasia (BPH)

Use: Unlabeled/InvestigationalSymptomatic treatment of bladder outlet obstruction or dysfunction

Dosing: Adults

BPH: Oral: 0.4 mg once daily ~30 minutes after the same meal each day; dose may be increased after 2-4 weeks to 0.8 mg once daily in patients who fail to respond. If therapy is interrupted for several days, restart with 0.4 mg once daily.

Bladder outlet obstruction (unlabeled use): Oral: 0.4 mg once daily ~30 minutes after the same meal each day

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} ≥10 mL/minute: No adjustment needed.

Cl_{cr} <10 mL/minute: Not studied.

Dosing: Hepatic Impairment

Mild-to-moderate impairment: No adjustment needed

Severe impairment: Not studied

Administration: OralAdminister 30 minutes after the same meal each day. Capsules should be swallowed whole; do not crush, chew, or open.

Dietary ConsiderationsTake once daily, 30 minutes after the same meal each day.

StorageStore at room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to tamsulosin or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Angina: Discontinue if symptoms of angina occur or worsen.
- Floppy iris syndrome: Intraoperative floppy iris syndrome has been observed in cataract surgery patients who were on or were previously treated with alpha$_1$-blockers; causality has not been established and there appears to be no benefit in discontinuing alpha-blocker therapy prior to surgery.
- Orthostatic hypotension/syncope: May cause significant orthostatic hypotension and syncope, especially with first dose; anticipate a similar effect if therapy is interrupted for a few days, if dosage is rapidly increased, or if another antihypertensive drug (particularly vasodilators) or a PDE-5 inhibitor (eg, sildenafil, tadalafil, vardenafil) is introduced. "First-dose" orthostatic hypotension may occur 4-8 hours after dosing; may be dose related. Patients should be cautioned about performing hazardous tasks when starting new therapy or adjusting dosage upward.
- Priapism: Priapism has been associated with use (rarely).
- Sulfonamide allergy: Rarely, patients with a sulfa allergy have also developed an allergic reaction to tamsulosin; avoid use when previous reaction has been severe.

Disease-related concerns:

- Prostate cancer: It is recommended to rule out prostatic carcinoma before beginning therapy.

Special populations:

- Females: Not indicated for use in women.
- Pediatrics: Not indicated for use in children.

Other warnings/precautions:

- Antihypertensive use: Not intended for use as an antihypertensive drug.

Geriatric Considerations Metabolism of tamsulosin may be slower, and older patients may be more sensitive to the orthostatic hypotension caused by this medication. A 40% higher exposure (AUC) is anticipated in patients between 55 and 75 years of age as compared to younger subjects (20-32 years).

Pregnancy Risk Factor B

Pregnancy Considerations Teratogenic effects were not observed in animal studies, however, tamsulosin is not approved for use in women.

Adverse Reactions

>10%:

Cardiovascular: Orthostatic hypotension (6 % to 19%)

Central nervous system: Headache (19% to 21%), dizziness (15% to 17%)

Genitourinary: Abnormal ejaculation (8% to 18%)

Respiratory: Rhinitis (13% to 18%)

Miscellaneous: Infection (9% to 11%)

1% to 10%:

Cardiovascular: Chest pain (4%)

Central nervous system: Somnolence (3% to 4%), insomnia (1% to 2%), vertigo (≤1%)

Endocrine & metabolic: Libido decreased (1% to 2%)

Gastrointestinal: Diarrhea (4% to 6%), nausea (3% to 4%), tooth disorder (1% to 2%)

Neuromuscular & skeletal: Weakness (8% to 9%), back pain (7% to 8%)

Ocular: Blurred vision (≤2%)

Respiratory: Pharyngitis (5% to 6%), cough (3% to 5%), sinusitis (2% to 4%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Allergic reactions (angioedema, pruritus, rash, urticaria, respiratory symptoms); constipation, hypotension, intraoperative floppy iris syndrome, orthostasis (symptomatic), palpitation, priapism, skin desquamation, syncope, transaminases increased, vomiting

Metabolism/Transport Effects **Substrate** (major) of CYP2D6, 3A4

Drug Interactions

Alfuzosin: Alpha1-Blockers may enhance the antihypertensive effect of Alfuzosin. Risk of orthostatic hypotension or syncope may be increased. Alfuzosin may enhance the antihypertensive effect of Alpha1-Blockers. *Risk X: Avoid combination*

Alpha1-Blockers: May enhance the antihypertensive effect of Tamsulosin. Risk of orthostatic hypotension or syncope may be increased. Tamsulosin may enhance the antihypertensive effect of Alpha1-Blockers. *Risk X: Avoid combination*

Beta-Blockers: May enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. **Exceptions:** Levobunolol; Metipranolol. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Alpha1-Blockers may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: May enhance the hypotensive effect of Alpha1-Blockers. *Risk D: Consider therapy modification*

Silodosin: Alpha1-Blockers may enhance the adverse/toxic effect of Silodosin. Of particular concern are the risk of postural hypotension, syncope, and/or hypotension. Silodosin may enhance the hypotensive effect of Alpha1-Blockers. Of particular concern are the risk of postural hypotension, syncope, and/or hypotension. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Fasting increases bioavailability by 30% and peak concentration 40% to 70%.

Herb/Nutraceutical: St John's wort: May decrease the levels/effects of tamsulosin. Avoid herbs with hypotensive properties (black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, Shepherd's purse); may enhance the hypotensive effect of tamsulosin. Avoid saw palmetto (due to limited experience with this combination).

Nursing: Physical Assessment/MonitoringNot for use as an antihypertensive. Assess potential for interactions with other pharmacological agents patient may be taking (eg, increased risk of hypotension). Assess results of periodic lipid panels, therapeutic effectiveness (improved urine flow), and adverse reactions (eg, "first dose" orthostatic hypotension, headache, gastrointestinal disturbance [nausea, vomiting], cough) at beginning of therapy and on a regular basis with long-term therapy. When discontinuing, dose should be tapered and blood pressure monitored closely. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsPeriodic lipid panels

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take as directed; do not skip dose or discontinue without consulting prescriber. May cause drowsiness, dizziness, or impaired judgment with first doses (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from sitting or lying position or when climbing stairs); nausea (frequent mouth care or sucking lozenges may help); urinary incontinence (void before taking medication); ejaculatory disturbance (reversible, may resolve with continued use of drug); diarrhea (buttermilk, boiled milk, or yogurt may help); palpitations or rapid heartbeat; respiratory difficulty, unusual cough, or sore throat; or other persistent side effects. Report palpitations or rapid heartbeat; respiratory difficulty; muscle weakness, fatigue, or pain; vision changes or hearing; rash; changes in urinary pattern; or other persistent side effects.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride:

Flomax®: 0.4 mg

Generic AvailableNo

ManufacturerBoehringer Ingelheim, Corp

Pricing: U.S. (www.drugstore.com)

Capsule, 24-hour (Flomax)

0.4 mg (30): $99.99

Mechanism of ActionTamsulosin is an antagonist of alpha$_{1A}$-adrenoreceptors in the prostate. Smooth muscle tone in the prostate is mediated by alpha$_{1A}$-adrenoreceptors; blocking them leads to relaxation of smooth muscle in the bladder neck and prostate causing an improvement of urine flow and decreased symptoms of BPH. Approximately 75% of the alpha$_1$-receptors in the prostate are of the alpha$_{1A}$ subtype.

Pharmacodynamics/Kinetics

Absorption: >90%

Protein binding: 94% to 99%, primarily to alpha$_1$ acid glycoprotein (AAG)

Metabolism: Hepatic via CYP3A4 and 2D6; metabolites undergo extensive conjugation to glucuronide or sulfate

Bioavailability: Fasting: 30% increase

Distribution: V$_d$: 16 L

Steady-state: By the fifth day of once-daily dosing

Half-life elimination: Healthy volunteers: 9-13 hours; Target population: 14-15 hours

Time to peak: Fasting: 4-5 hours; With food: 6-7 hours

Excretion: Urine (76%, <10% as unchanged drug); feces (21%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension and tooth disorder.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause drowsiness or insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsTamsulosin should not be used as an antihypertensive agent despite its alpha-blocking properties. It may induce significant orthostatic hypotension with lightheadedness and possible loss of consciousness.

Anesthesia and Critical Care Concerns/Other ConsiderationsTamsulosin may induce significant orthostatic hypotension with lightheadedness and possible loss of consciousness.

Index TermsTamsulosin Hydrochloride

Tazarotene

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(taz AR oh teen)

U.S. Brand NamesAvage™; Tazorac®

Canadian Brand NamesTazorac®

Pharmacologic CategoryAcne Products; Keratolytic Agent; Topical Skin Product, Acne

Use: Labeled IndicationsTopical treatment of facial acne vulgaris; topical treatment of stable plaque psoriasis of up to 20% body surface area involvement; mitigation (palliation) of facial skin wrinkling, facial mottled hyper-/hypopigmentation, and benign facial lentigines

Dosing: Adults**Note:** In patients experiencing excessive pruritus, burning, skin redness, or peeling, discontinue until integrity of the skin is restored, or reduce dosing to an interval the patient is able to tolerate.

Acne: Topical: Tazorac® cream/gel 0.1%: Cleanse the face gently. After the skin is dry, apply a thin film of tazarotene (2 mg/cm^2) once daily, in the evening, to the skin where the acne lesions appear; use enough to cover the entire affected area

Palliation of fine facial wrinkles, facial mottled hyper/hypopigmentation, benign facial lentigines: Topical: Avage™: Apply a pea-sized amount once daily to clean dry face at bedtime; lightly cover entire face including eyelids if desired. Emollients or moisturizers may be applied before or after; if applied before tazarotene, ensure cream or lotion has absorbed into the skin and has dried completely.

Psoriasis: Topical:

Tazorac® cream/gel 0.05% or 0.1%: Apply once daily, in the evening, to psoriatic lesions using enough (2 mg/cm^2) to cover only the lesion with a thin film to no more than 20% of body surface area. If a bath or shower is taken prior to application, dry the skin before applying. Unaffected skin may be more susceptible to irritation, avoid application to these areas. **Note:** In patients experiencing excessive pruritus, burning, skin redness, or peeling, discontinue until integrity of the skin is restored, or reduce dosing to an interval the patient is able to tolerate.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** In patients experiencing excessive pruritus, burning, skin redness, or peeling, discontinue until integrity of the skin is restored, or reduce dosing to an interval the patient is able to tolerate.

Acne: Children ≥12 years: Topical: Tazorac® cream/gel 0.1%: Cleanse the face gently. After the skin is dry, apply a thin film of tazarotene (2 mg/cm^2) once daily, in the evening, to the skin where the acne lesions appear; use enough to cover the entire affected area

Psoriasis: Children ≥12 years: Topical: Tazorac® gel 0.05% or 0.1%: Apply once daily, in the evening, to psoriatic lesions using enough (2 mg/cm^2) to cover only the lesion with a thin film to no more than 20% of body surface area. If a bath or shower is taken prior to application, dry the skin before applying. Unaffected skin may be more susceptible to irritation, avoid application to these areas.

Palliation of fine facial wrinkles, facial mottled hyper/hypopigmentation, benign facial lentigines: Children ≥17 years: Topical: Avage™: Refer to adult dosing.

Administration: TopicalDo not apply to eczematous or sunburned skin; apply thin film to affected areas; avoid eyes and mouth

StorageStore at room temperature of 25°C (77°F), away from heat and direct light; do not freeze.

ContraindicationsHypersensitivity to tazarotene, other retinoids or vitamin A derivatives (isotretinoin, tretinoin, etretinate), or any component of the formulation; use in women of childbearing potential who are unable to comply with birth control requirements; pregnancy (negative pregnancy test required)

Allergy Considerations

- Retinoid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Photosensitivity: May cause photosensitivity; exposure to sunlight should be avoided unless deemed medically necessary, and in such cases, exposure should be minimized (including use of sunscreens/protective clothing). Risk may be increased by concurrent therapy with known photosensitizers (thiazides, tetracyclines, fluoroquinolones, phenothiazines, sulfonamides).

- Skin irritation: Treatment can increase skin sensitivity to weather extremes of wind or cold. Also, concomitant topical medications (eg, medicated or abrasive soaps, cleansers, or cosmetics with a strong drying effect) should be used with caution due to increased skin irritation.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

- Women of childbearing potential: Must use adequate contraceptive measures because of potential teratogenicity.

Dosage form specific issues:

- Gel: Safety and efficacy of gel applied over >20% of BSA have not been established.

Other warnings/precautions:

- Appropriate use: For external use only; avoid contact with eyes, eyelids, and mouth. Not for use on eczematous, broken, or sunburned skin; not for treatment of lentigo maligna. Avoid application over extensive areas.

Geriatric ConsiderationsNo differences in safety or efficacy were seen when the cream formulation was administered to patients >65 years of age; may experience increased sensitivity. Increased incidence of adverse effects and lower treatment success rates were observed with the gel formulation in the treatment of psoriasis.

Pregnancy Risk FactorX

Pregnancy ConsiderationsMay cause fetal harm if administered to a pregnant woman. A negative pregnancy test should be obtained 2 weeks prior to treatment; treatment should begin during a normal menstrual period.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsPercentage of incidence varies with formulation and/or strength:

>10%: Dermatologic: Burning/stinging, desquamation, dry skin, erythema, pruritus, skin pain, worsening of psoriasis

1% to 10%: Dermatologic: Contact dermatitis, discoloration, fissuring, hypertriglyceridemia, inflammation, irritation, localized bleeding, rash

Frequency not defined:

Dermatologic: Photosensitization

Neuromuscular & skeletal: Peripheral neuropathy

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersDisease severity in plaque psoriasis during therapy (reduction in erythema, scaling, induration); routine blood chemistries (including transaminases) are suggested during long-term topical therapy; pregnancy test prior to treatment of female patients

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (eg, accumulated photosensitivity). Assess therapeutic effectiveness and adverse response on a regular basis during therapy. Teach patient proper use, side effects/appropriate interventions, and adverse reactions to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment. Do not give to women of childbearing age unless they are capable of complying with contraceptive use. Instruct patients of childbearing age about appropriate contraceptive measures.

Patient EducationThis medication is for external use only; avoid using near eyes or mouth. Use exactly as directed; do not use more than recommended (severe skin reactions may occur). Avoid any other skin products (including cosmetics or personal products that may contain medications, spices, alcohols, or irritants) that are not approved by your prescriber. May cause photosensitivity, which will cause severe rash or burning (use sunblock SPF 15 or higher, wear protective clothing and eyewear, and avoid direct sunlight, sunlamps, or tanning beds). Report redness or discoloration, irritation, open sores, bleeding, burning, stinging, excessive dryness, or swelling of skin; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during treatment. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not allow anyone who may be or become pregnant to touch this medication. Consult prescriber if breast-feeding.

Application: Wash affected area gently and completely dry before applying medication. Apply a thin layer to cover affected area. Wash off any medication that gets on unaffected skin areas and wash hands thoroughly after application.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream:

Avage™: 0.1% (30 g) [contains benzyl alcohol]

Tazorac®: 0.05% (30 g, 60 g); 0.1% (30 g, 60 g) [contains benzyl alcohol]

Gel (Tazorac®): 0.05% (30 g, 100 g); 0.1% (30 g, 100 g) [contains benzyl alcohol]

Mechanism of Action Synthetic, acetylenic retinoid which modulates differentiation and proliferation of epithelial tissue and exerts some degree of anti-inflammatory and immunological activity

Pharmacodynamics/Kinetics

Duration: Therapeutic: Psoriasis: Effects have been observed for up to 3 months after a 3-month course of topical treatment

Absorption: Minimal following cutaneous application (≤6% of dose)

Distribution: Retained in skin for prolonged periods after topical application.

Protein binding: >99%

Metabolism: Prodrug, rapidly metabolized via esterases to an active metabolite (tazarotenic acid) following topical application and systemic absorption; tazarotenic acid undergoes further hepatic metabolism

Half-life elimination: 18 hours

Excretion: Urine and feces (as metabolites)

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment Use caution with drugs known to cause photosensitivity (psychotropics), effects may be augmented

Special Alerts

Tegaserod: Treatment Investigational New Drug (T-IND) Protocol Discontinued, Only Emergency Access Allowed - April 2008

Novartis, the manufacturer of tegaserod (Zelnorm®), announced the voluntary discontinuation of the T-IND protocol. In March 2007, tegaserod was discontinued from U.S. and Canadian markets, but in July 2007, the T-IND protocol was developed to allow limited availability of tegaserod for use only in the treatment of irritable bowel syndrome with constipation (IBS-C) or chronic idiopathic constipation (CIC) in women (<55 years of age) in which no other treatment alternatives exist. At present, Novartis has agreed to allow access to tegaserod only in emergency situations, defined as immediately life-threatening or situations which require hospitalization, under an emergency IND process. Requests for emergency use should be made to the FDA, who will either deny the request or authorize shipment of the medication by Novartis. Authorization will be denied if patients have any of the following conditions: Unstable angina, history of heart attack or stroke, hypertension, hyperlipidemia, diabetes, age ≥55 years, smoking, obesity, depression, anxiety, or suicidal ideation.

Physicians having patients who may qualify for emergency use of tegaserod may contact the FDA's Division of Drug Information via email (druginfo@fda.hhs.gov), by calling (301-796-3400), or at http://www.fda.gov/cder.

Additional information can be found at:

http://www.fda.gov/cder/drug/infopage/zelnorm/default.htm

http://www.zelnorm.com

Pronunciation(teg a SER od)

U.S. Brand NamesZelnorm®

Canadian Brand NamesZelnorm® [DSC]

Pharmacologic CategorySerotonin 5-HT$_4$ Receptor Agonist

Use: Labeled IndicationsEmergency treatment of irritable bowel syndrome with constipation (IBS-C) and chronic idiopathic constipation (CIC) in women (<55 years of age) in which no alternative therapy exists

Dosing: Adults

IBS with constipation: Females <55 years of age: Oral: 6 mg twice daily, before meals, for 4-6 weeks; may consider continuing treatment for an additional 4-6 weeks in patients who respond initially

Chronic idiopathic constipation: Females <55 years of age: Oral: 6 mg twice daily, before meals; the need for continued therapy should be reassessed periodically

Dosing: ElderlyUse in elderly women (≥55 years of age) is contraindicated.

Dosing: Renal ImpairmentC$_{max}$ and AUC of the inactive metabolite are increased with renal impairment.

Mild to moderate impairment: No dosage adjustment recommended

Severe impairment: Use is contraindicated

Dosing: Hepatic ImpairmentC$_{max}$ and AUC of tegaserod are increased with hepatic impairment.

Mild impairment: No dosage adjustment recommended; however, user caution

Moderate to severe impairment: Use is contraindicated

Administration: OralAdminister 30 minutes before meals.

Dietary ConsiderationsTake on an empty stomach, 30 minutes before meals.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from moisture.

RestrictionsAvailable in U.S. under an emergency investigational new drug (IND) process. Emergency situations are defined as immediately life-threatening or requiring hospitalization. Physicians with patients who may qualify can contact the FDA's Division of Drug Information via email (druginfo@fda.hhs.gov), by calling (301-796-3400), or at http://www.fda.gov/cder. The FDA may either deny the request or authorize shipment of Zelnorm® by Novartis. Additional information can be found at http://www.zelnorm.com or http://www.fda.gov/cder/drug/infopage/zelnorm/default.htm

ContraindicationsPer product labeling: Hypersensitivity to tegaserod or any component of the formulation; severe renal impairment; moderate or severe hepatic impairment; history of bowel obstruction, symptomatic gallbladder disease, suspected sphincter of Oddi dysfunction, or abdominal adhesions. Treatment should not be started in patients with diarrhea or in those who experience diarrhea frequently.

Exclusion criteria under the emergency-IND process: Unstable angina, history of MI or stroke, hypertension, hyperlipidemia, diabetes, age ≥55 years, smoking, obesity, depression, anxiety, or suicidal ideation.

Warnings/Precautions

Concerns related to adverse reactions:

- Cardiovascular effects: Serious cardiovascular events (eg, MI, stroke, unstable angina) may occur; patients should seek emergency care following any sign and symptom suggestive of a serious cardiac event.
- Diarrhea: May occur after the start of treatment, most cases reported as a single episode within the first week of therapy, and may resolve with continued dosing. However, serious consequences of diarrhea (hypovolemia, syncope) have been reported; patients should be warned to contact healthcare provider immediately if they develop severe diarrhea, or diarrhea with severe cramping, abdominal pain, or dizziness.
- Intestinal ischemic events: Use has been associated with rare intestinal ischemic events; discontinue immediately with new or sudden worsening abdominal pain or rectal bleeding.

Disease-related concerns:

- Cardiovascular disease: Use will not be permitted in patients with unstable angina, a history of MI or stroke, hyperlipidemia, cigarette smoking, hypertension, or obesity.
- Depression: Use will not be permitted in patients with depression or anxiety, or with any signs of suicidal ideation or behavior.
- Diabetes: Use will not be permitted in patients with diabetes.
- Hepatic impairment: Use with caution in patients with mild hepatic impairment; not recommended with moderate or severe impairment.

Special populations:

- Elderly women: Contraindicated in women ≥55 years of age.
- Males: Safety and efficacy have not been established in males.
- Pediatrics: Safety and efficacy have not been established in children <18 years of age.

Other warnings/precautions:

- Risk vs benefit: Potential benefits should be weighed against potential risks in qualifying patients eligible for emergency-IND use.

Geriatric ConsiderationsNo dosing adjustment is required.

Pregnancy Risk FactorB

Pregnancy ConsiderationsSafety and efficacy have not been established in pregnant women. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Central nervous system: Headache (15%)

Gastrointestinal: Abdominal pain (12%)

1% to 10%:

Central nervous system: Dizziness (4%), migraine (2%)

Gastrointestinal: Diarrhea (9%; severe <1%), nausea (8%), flatulence (6%)

Neuromuscular & skeletal: Back pain (5%), arthropathy (2%), leg pain (1%)

<1%: Albuminuria, ALT increased, angina pectoris, appendicitis, appetite increased, arrhythmia, asthma, AST increased, breast carcinoma, bundle branch block, cholecystitis, concentration impaired, CPK increased, cramps, depression, diaphoresis, emotional lability, eructation, facial edema, fecal incontinence, flushing, hypotension, irritable colon, menorrhagia, micturition, miscarriage, ovarian cyst, pain, polyuria, pruritus, renal pain, serum bilirubin increased, sleep disorder, subileus, suicide attempt, supraventricular tachycardia, syncope, tenesmus, vertigo

Postmarketing and/or case reports: Alopecia, bile duct stone, cholecystitis (with increased transaminases), gangrenous bowel, hepatitis, hypersensitivity reaction, hypokalemia (secondary to diarrhea), ischemic colitis, mesenteric ischemia, MI, rectal bleeding, sphincter of Oddi spasm (suspected), severe diarrhea (complicated by hypovolemia, hypotension, syncope), stroke, unstable angina

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb InteractionsFood: Bioavailability is decreased by 40% to 65% and C_{max} is decreased by 20% to 40% when taken with food. T_{max} is prolonged from 1 hour up to 2 hours when taken following a meal, but decreased to 0.7 hours when taken 30 minutes before a meal.

Nursing: Physical Assessment/Monitoring**For emergency use only under FDA emergency investigational new drug process.** Evaluate therapeutic effectiveness (improved bowel function) and adverse response (eg, cardiac event, clinically-significant diarrhea [hypovolemia, hypotension, syncope], ischemic colitis [rectal bleeding, bloody diarrhea, abdominal pain]) frequently when beginning therapy and at regular intervals during treatment. Teach patient appropriate use, side effects/appropriate interventions, and importance of reporting adverse reactions.

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber.

Take exactly as directed, on an empty stomach, 30 minutes before meals. If you miss a dose, skip that dose and continue with regular schedule; do not double doses. Effectiveness of treatment will need to be evaluated by prescriber; maintain contact/appointment schedule as directed. May cause headache or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea or flatulence (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or diarrhea. Stop taking Zelnorm® and contact prescriber immediately with any new or sudden worsening abdominal pain or rectal bleeding, or severe or bloody diarrhea. Seek emergency medical care immediately if you experience severe chest pain, shortness of breath, dizziness, sudden onset of weakness, or difficulty walking or talking. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Special Alerts

Telbivudine Use With Peginterferon Alfa-2a: Increased Risk of Peripheral Neuropathy - March 2008

Novartis Pharmaceuticals Canada Inc, in conjunction with Health Canada, has issued a “Dear Healthcare Professional” letter concerning an increased risk for peripheral neuropathy in chronic hepatitis B patients receiving telbivudine (Sebivo®) concomitantly with peginterferon alfa-2a (Pegasys®) versus telbivudine or peginterferon as monotherapy. In clinical trials, the incidence of peripheral neuropathy associated with telbivudine monotherapy was rare (0.3%). Conversely, the incidence associated with peginterferon alfa-2a monotherapy is more frequent (≥1% to <5%), and it appears the risk of peripheral neuropathy with the concomitant use of the two agents is further increased.

In a small ongoing clinical trial (n=48), peripheral neuropathy in association with the combination therapy occurred in 17% of patients and ~10% of these were described as severe. Symptoms included weakness, paresthesia, and leg pain (disabling in one patient), and were observed 1-6 months after initiation of therapy in those with severe reactions. Discontinuation of therapy may lead to symptom resolution; however, the outcomes for those patients discontinuing treatment in the described study are still either unknown or unresolved 1-6 months after discontinuing therapy. It is unknown if this increased risk applies to other pegylated or standard interferon agents. Patients receiving telbivudine concomitantly with an interferon product should be advised to consult their physician or healthcare professional.

Pronunciation(tel BI vyoo deen)

U.S. Brand NamesTyzeka™

Canadian Brand NamesSebivo®

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleoside)

Use: Labeled IndicationsTreatment of chronic hepatitis B with evidence of viral replication and either persistent transaminase elevations or histologically-active disease

Dosing: Adults**Chronic hepatitis B:** Oral: 600 mg once daily. **Note:** Usual treatment duration is at least 1 year and varies with HBeAg status, consult current guidelines and literature.

Dosing: Pediatric**Chronic hepatitis B:** Oral: Adolescents ≥16 years: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 30-49 mL/minute: 600 mg every 48 hours

Cl_{cr} <30 mL/minute (not requiring dialysis): 600 mg every 72 hours

End-stage renal disease: 600 mg every 96 hours

Hemodialysis: Administer after dialysis session

Dosing: Hepatic Impairment No adjustment necessary.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralMay be administered without regard to food.

Dietary ConsiderationsMay be taken without regard to food.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to telbivudine or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Chronic hepatitis B: See “Disease-related concerns” below.

- Lactic acidosis/hepatomegaly: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Lactic acidosis/hepatomegaly: **[U.S Boxed Warning]: Lactic acidosis and severe hepatomegaly with steatosis have been reported with nucleoside analogues, including fatal cases;** use with caution in patients with risk factors for liver disease (risk may be increased with female gender, obesity, pregnancy or prolonged exposure) and suspend treatment in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or hepatotoxicity (transaminase elevation may/may not accompany hepatomegaly and steatosis).

- Myopathy: Use has been associated with myopathy (unexplained muscle aches and/or muscle weakness in conjunction with serum creatine kinase increases) several weeks to months after initiation of telbivudine; interrupt therapy if myopathy suspected and discontinue therapy if myopathy diagnosed.

Disease-related concerns:

- Chronic hepatitis B: **[U.S. Boxed Warning]: Severe, acute exacerbation of hepatitis B may occur upon discontinuation.** Monitor liver function several months after stopping treatment; reinitiation of antihepatitis B therapy may be required.

- Human immunodeficiency virus: Telbivudine does not exhibit any clinically-relevant activity against HIV type 1.

- Renal impairment: Use caution in patients with moderate to severe renal dysfunction and end stage renal disease (ESRD); dosing adjustment required (Cl_{cr} <50 mL/minute).

Concurrent drug therapy:

- Peginterferon alfa-2a: An increased risk of peripheral neuropathy (rarely observed with telbivudine monotherapy), has been associated with the concomitant use of telbivudine and peginterferon alfa-2a in a small study (n=48). Symptoms including weakness, paresthesia, and leg pain (disabling in one patient) have been observed 1-6 months after initiation of therapy. Symptoms may resolve with discontinuation of therapy; however, in the described study, outcomes for affected patients are either unresolved or not known 1-6 months after discontinuing therapy. It is unknown if this increased risk applies to other pegylated or standard interferon agents.

Special populations:

- Coinfections: Safety and efficacy have not been studied in patients coinfected with HIV, hepatitis C virus (HCV) or hepatitis D virus (HDV).

- Liver transplant recipients: Safety and efficacy in liver transplant patients have not been established; monitor renal function in patients receiving concurrent therapy of cyclosporine or tacrolimus.

- Pediatrics: Safety and efficacy have not been established in children <16 years of age.

Other warnings/precautions:

- Resistance: Cross-resistance among hepatitis B antivirals may develop; use caution in patients failing previous lamivudine therapy.

Geriatric ConsiderationsInsufficient clinical data in elderly to determine differences between aged patients and younger patients. Since elderly often have Cl_{cr} <50 mL/minute, dosage should be determined accordingly.
Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects have not been observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263).
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

>10%:

Central nervous system: Fatigue (12%), malaise (12%), headache (11%)

Gastrointestinal: Abdominal pain (12%)

Neuromuscular & skeletal: CPK increased (72%; grades 3/4: 9%)

Respiratory: Upper respiratory tract infection (14%), nasopharyngitis (11%)

1% to 10%:

Central nervous system: Dizziness (4%), fever (4%), insomnia (3%)

Dermatologic: Rash (4%)

Endocrine & metabolic: Lipase increased (2%)

Gastrointestinal: Nausea (7%), vomiting (7%), diarrhea (7%), dyspepsia (3%)

Hematologic: Neutropenia (2%)

Hepatic: ALT increased (grades 3/4: 3% to 4%), AST increased (grades 3/4: 3%)

Neuromuscular & skeletal: Arthralgia (4%), back pain (4%), myalgia (3%)

Respiratory: Cough (7%), pharyngolaryngeal pain (5%)

Miscellaneous: Flu-like syndrome (7%), postprocedural pain (7%)

<1%: Amylase increased, bilirubin increased, gastritis, thrombocytopenia

Postmarketing and/or case reports: Peripheral neuropathy (increased incidence observed when used concomitantly with peginterferon alfa-2a)

Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb Interactions

Ethanol: Should be avoided in hepatitis B infection due to potential hepatic toxicity.

Food: Does not have a significant effect on telbivudine absorption.
